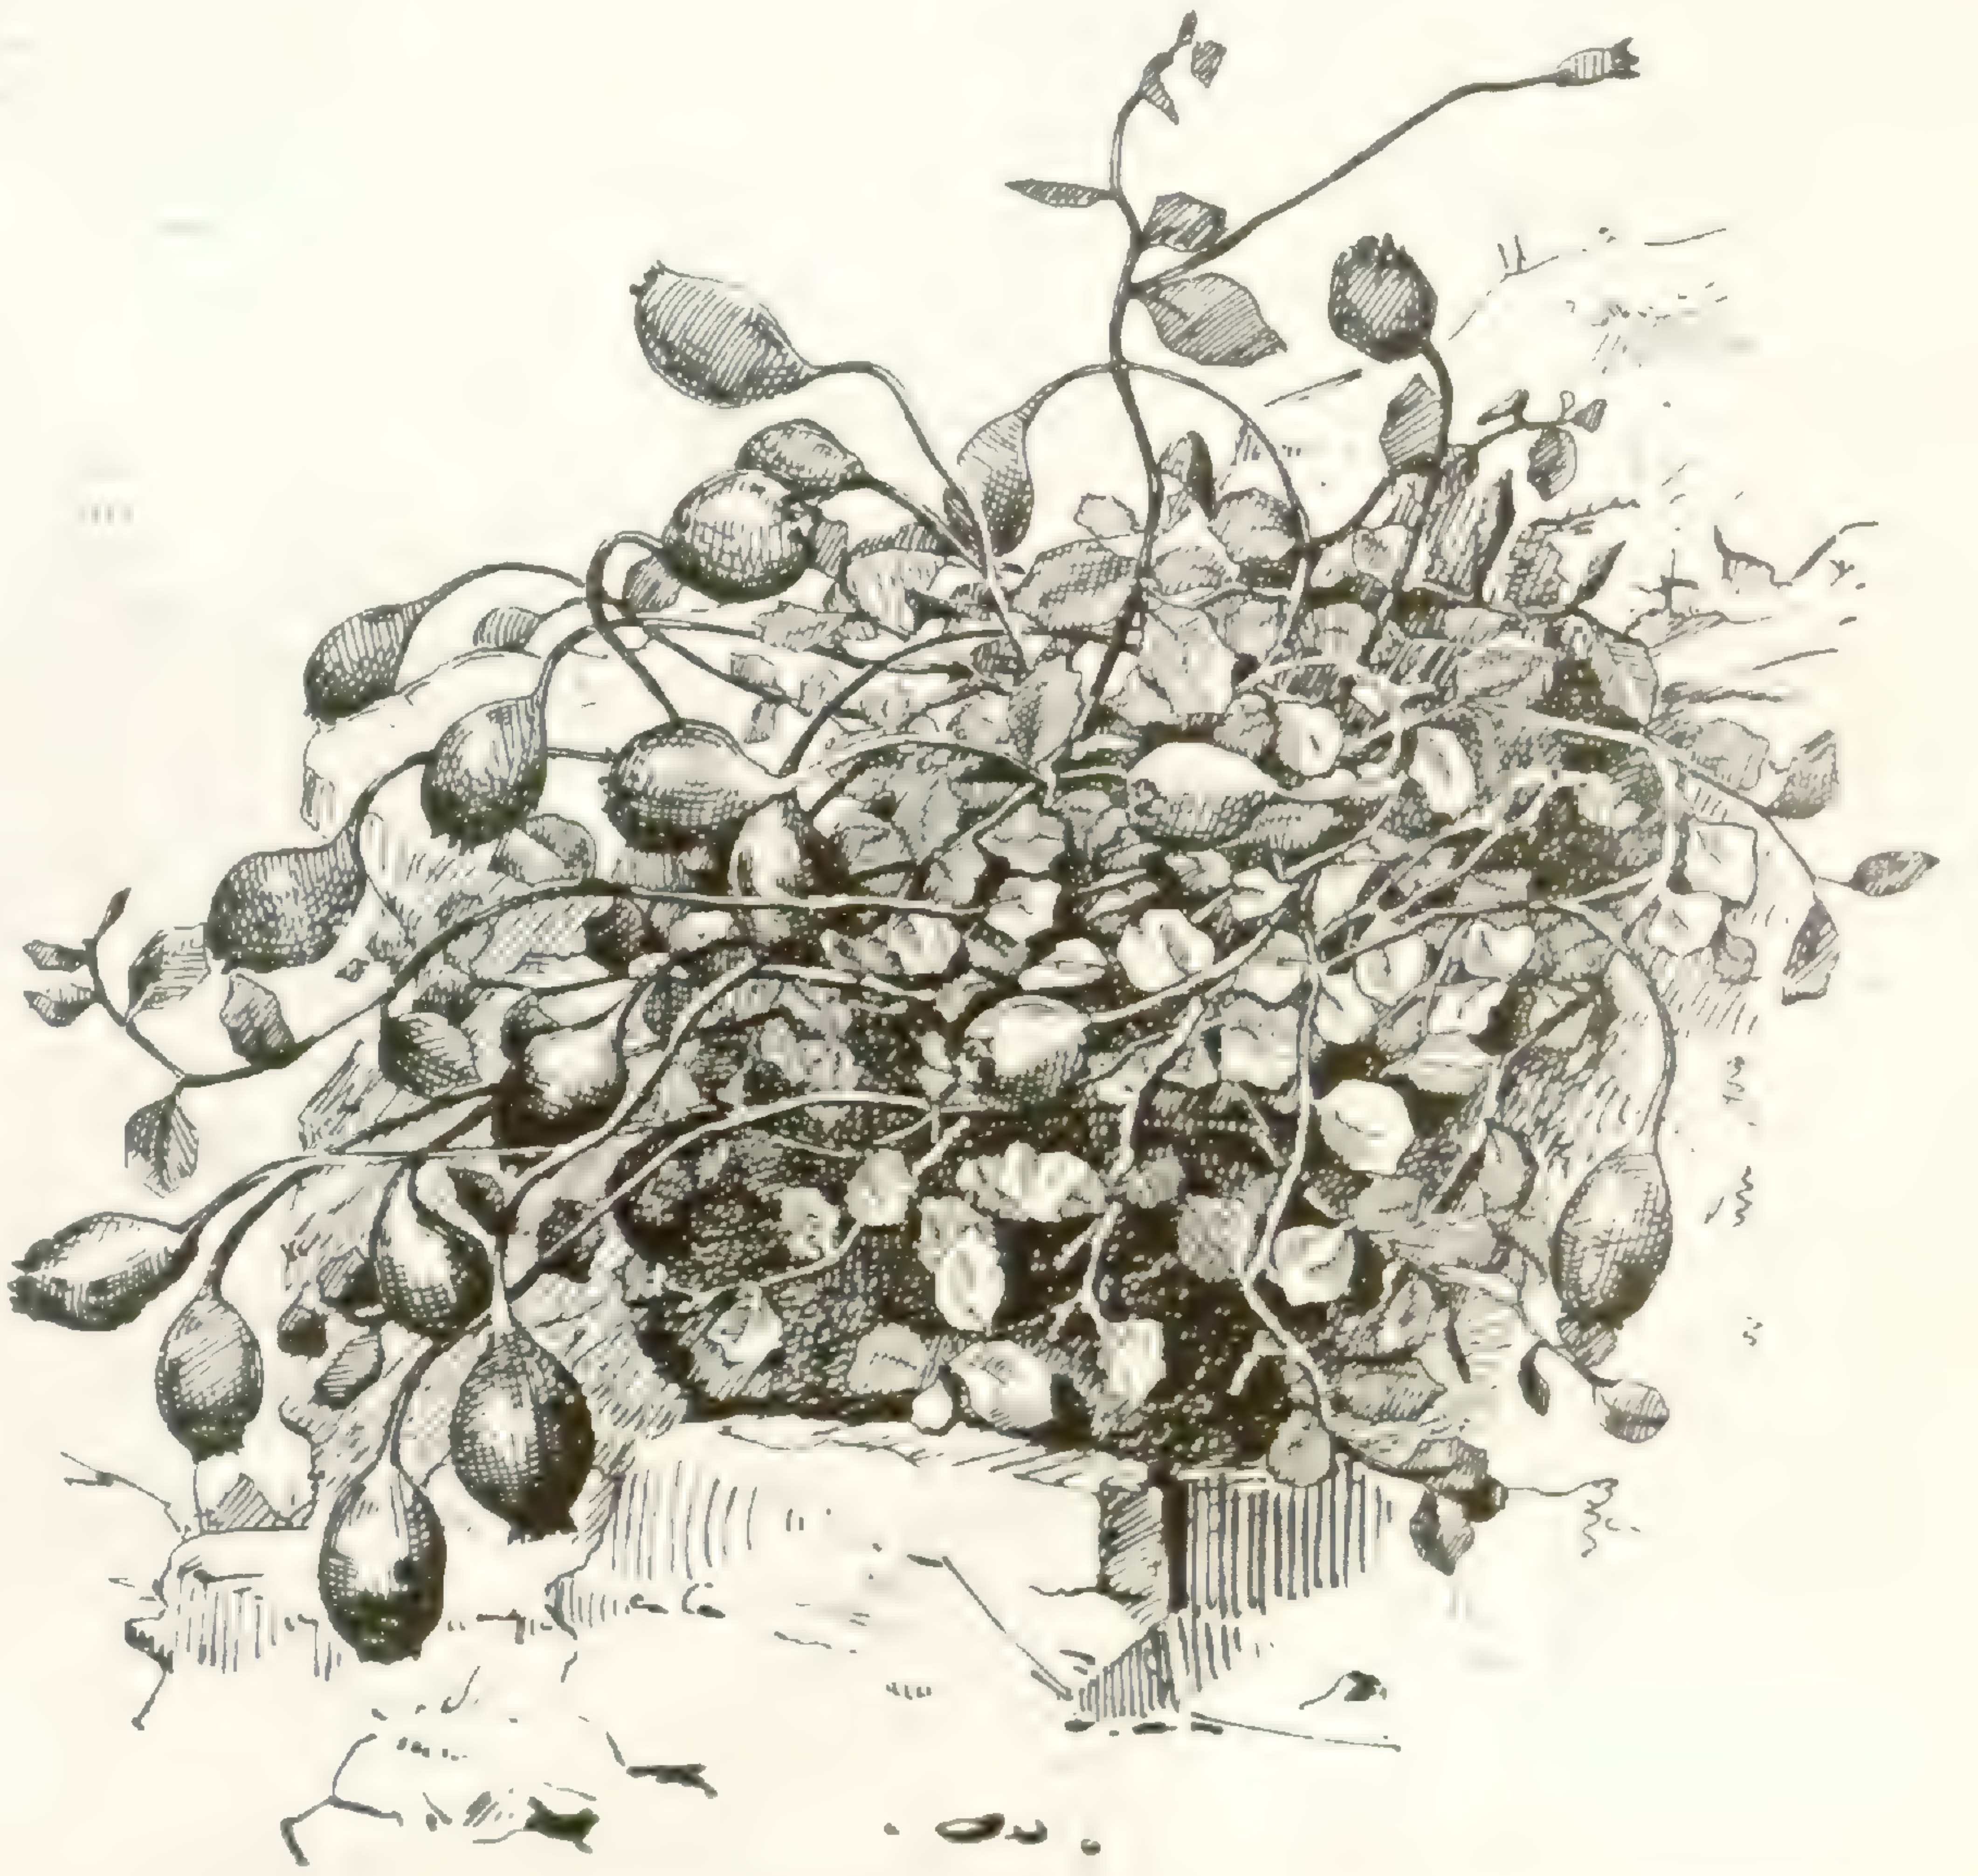
A lowly plant of creeping habit that is by no means sufficiently well-known to lovers of rock gardens is the New Zealand Pratia angulata, also known as Lobelia littoralis. It belongs to the lobelia section of the large Natural Order Campanulaceæ, and its long-stemmed white flowers are very like those of a lobelia in shape. The slender, trailing stems carry small leaves that are somewhat angular in outline, though the form varies a good deal. The flowers are borne freely in late spring and early summer, and these are followed in due course by oval berries of a deep purplish-red hue. This little trailing plant is always interesting, and is also beautiful over a long period. For the lower part of the rock garden where it can trail over and among small stones it is especially adapted. It certainly seems to appreciate a warm position where, at the same time, its roots do not lack moisture. Plants may be divided in the spring when increase of stock is desirable, but propagation may be also effected by means of seeds sown in a cold frame as soon as ripe, or in gentle heat in the spring; in either case the young seedlings should be hardened off ready for planting out of doors at the end of May or early in June.



PRATIA ANGULATA.

A lowly, trailing rock plant, with white lobelia-like flowers, that are followed by purplish-red berries.

Wet Summers and the Fruit Crops.—We have now had two wet summers consecutively, and I notice that in some districts, where the soil is naturally clayey, the new shoots on fruit trees are very strong, and not too well matured. In sandy, gravelly districts the current year's shoots are not very strong, and the wood appears to be fairly well ripened. Furthermore, I have observed that the trees bore a fair quantity of fruit, especially the apples. Very strong shoots did not grow on trees planted in poor soils, and, consequently, they matured well last autumn.—G. B.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

At the exhibition held in the Royal Horticultural Hall on November 8 there was a considerable falling off in the extent of the display, as compared with the shows held recently. The frosts and gales of the previous week had put an end to outdoor flowers, consequently the chief attractions were chrysanthemums, winter-flowering begonias, a splendid lot of orchids from various sources, and a magnificent lot of exotic ferns.

FLORAL COMMITTEE.

Across the top of the hall Messrs. J. Hill and Son, Edmonton, displayed a magnificent collection of finely-grown ferns. They had huge plants of a great majority of the subjects, and these represented culture of the highest order. Towering above the other things were tall specimens of Dicksonia squarrosa, Cibotium Scheidei, and Hemitelia Smithi. Beneath these the leading specimens were of Davallia fijiensis robusta, D. epiphylla, D. Mooreana, D. tenuifolia Veitchi, D. pentaphylla, D. polyantha, Adiantum O'Brieni, A. Birkenheadi, A. peruviana, A. digitatum, Nephrolepis Scotti, N. todeaoides, N. Amerpohli, N. Scholzeli, Asplenium nidus avis, Polypodium irioides ramo-cristatum, P. aureum, P. giganteum, P. Schneideri, Brainea insignis, Dicksonia Barometz, Platycerium Hilli, Lygodium scandens, Gymnogramma elegantissima, G. grandiceps superba, G. Alstoni, and many other fine things.

Messrs. James Veitch and Sons, Chelsea, submitted a grand group of pot-grown chrysanthemums, all neat bush plants, admirably grown, and carrying a fine lot of flowers. The plants were in 48-sized pots, and furnished to the rim with foliage. Among the decorative varieties the most conspicuous were Hortus Toulousaine, Hutching's Pink, Soleil d'Octobre, John Shrimpton, and M. Jules Valet, while among single varieties that appear to be especially suitable for this mode of culture we noted Exmouth Yellow, Sylvia Slade, J. H. Greswold Williams, Metta, Cinnamon, Mary Anderson, E. Nottell, and Miss Mary Pope. On another table the Chelsea firm staged batches of freely-flowered plants of their handsome winter-flowering begonias, Ideala, Success, Ensign, Elatior—very fine, Julius, and Mrs. Heal, the latter with large carmine flowers. Jacobinia chrysostephana and hybrid gerberas were also contributed.

Messrs. W. Wells and Co., Merstham, showed a few of the newer chrysanthemums, and some quaint single varieties imported recently from Japan. Among large Japanese varieties they showed Wells' White, C. H. Totty, W. Mease, Leonard Johnson, Mrs. R. Witty, and Mrs. W. Wincott, the last-named a promising market variety.

Messrs. G. Williams and Sons, Cardiff, contributed a fairly large group of chrysanthemums, showing single, Japanese, and decorative varieties in considerable variety: Novelty, White Pagram, Sylvia Slade, Manor House Beauty, Mr. Frank Hill (A.M.), Charles Greaves, and Crown Jewel were among the best of the single varieties.

Messrs. Stuart Low and Co., Enfield, presented cyclamens in variety, the fragrant Daphne indica, and a set of perpetual-flowering carnations, the leading varieties here being Britannia, Mrs. T. W. Lawson, Lady Alington, Royal Purple, and J. W. Riley, a new American variety of sulphur-yellow colour.

Messrs. H. B. May and Sons, Upper Edmonton, occupied an entire table with hardy ferns and begonias. The former included fine groups of Polypodium vulgare grandiceps Foxæ, P. v. c. Prestoni, P. v. g. Forsteri, P. v. cristatum, and P. v. cambricum. Needless to add, all were in perfect condition. The begonias included Gloire de Lorraine, Turnford Hall, Mrs. L. de Rothschild, and Masterpiece.

From Messrs. W. Cutbush and Son, Highgate, came a table of miscellaneous plants, which included groups of Skimmia japonica beautifully berried, Erica gracilis, Spiræa Peach Blossom, and S. astilboides (retarded), Lilium lancifolium rubrum, and L. longiflorum, Dracæna Bruanti variegata in fine colour, while the centre was occupied with well-fruited plants of Citrus sinensis. The Highgate firm also had a large display of autumn flowers, such as Chrysanthemum R. Felton, Schizostylis coccinea, Senecio pulcher, and Tussilago fragrans. The berried plants included a good collection of pernettyas and a nice cluster of Euonymus europæus; they also had an excellent exhibit of carnations in which were fine vases of Victory, Countess of Bradford, Beacon, Lady Elphinstone, Lord Rothschild, and Lady Coventry.

From Messrs. H. Cannell and Sons, Swanley, came a salmon zonal pelargonium named Salmon Paul Crampel, which had undoubtedly a good salmon flower, and the true foliage of Paul Crampel. Mr. G. Lange, Hanworth Road, Hampton, staged a few new varieties of perpetual flowering carnations, in which we noted James Witcomb Riley, which still remains a pale sulphur-yellow in this country; Scarlet Glow, a splendid red; May Day, Admiration, Bay State, and Ruby. Mr. G. Reuthe, Keston, Kent, had an exhibit of nerines in variety, with pernettyas, and a few rare alpines. From Messrs. Price and Fyfe, Grove Park Nursery, Lee, S.E., came a small exhibit of single chrysanthemums in sixty-sized pots.

Messrs. J. Peed and Son, West Norwood, presented a big group of chrysanthemums, which included specimen blooms of the Japanese section, with singles in pots. The foreground being composed of specimen flowers. In the latter section were noted fine flowers of W. Mease, Leigh Park Wonder, Mrs. Charles Penford, Splendour, and Lady Crisp. The group was tastefully built up in a setting of adiantums.

Mr. F. Galsworthy, Green Lane Farm, Chertsey, exhibited a collection of water-colour paintings of flowers, which excited much admiration, the daffodils being especially life-like, as were also the tulips, pyrus, and wallflowers.

ORCHID COMMITTEE.

Messrs. Stuart Low and Co., Enfield, contributed a very bright group of orchids, in which oncidiums were well represented along the back line. Good things in the body of the group were Cattleya Mantini, C. labiata, C. l. Cooksoni, Bulbophyllum grandiflorum, Odontoglossum grande, Miltonia vexillaria Leopoldi, and the self yellow Oncidium varicosum concolor. Messrs. Sander and Sons, St. Albans, put up a bold group of very interesting orchids that included Odontoglossum bellatulum, O. crispum, O. eximium, O. amabile, Odontioda St. Fuscien ignea, O. Groganiæ, Lælio-cattleya Lady Rothschild, L.-c. Walter Gott, Cattleya Aliceæ, the fine C. Fabia, Brasso-cattleya Maronæ, Cypripedium Actæus, C. Minos, C. Leeanum Clinkaberryanum, C. Dreadnought—very fine, C. insigne Harefield Hall, and some fine spikes of Vanda cærulea. In addition there were a few miniature orchids of botanical interest.

Messrs. Charlesworth and Co., Haywards Heath, had a very handsome group of orchids, and showed fine plants of Odontoglossum armainvilliersense, O. ardentissimum, O. Pescatorei, O. amabile, Oncidium Forbesi, O. tigrinum, O. Lindeni, Cattleya labiata alba, C. Venus, C. Rhoda, the curious Chondroshyncha Chestertoni, Odontioda Bradshawiæ, Cypripedium Rosetti, C. Reginald Young, a large plant of the brown Oncidium prætextum, and the fragrant Zygopetalum Binoti. Messrs. J. and A. McBean, Cooksbridge, showed Cypripedium insigne Harefield Hall, C. insigne Sanderæ, and Cattleya Portia superba. M. Maurice Mertens, Mont St. Amand, Ghent, submitted a few very fine odontoglossums, all unnamed. From R. G. Thwaites, Esq., Christchurch Road, Streatham, came good plants of Odontioda Charlesworthi, O. Bradshawiæ, O. Seymouri, Sophro-cattleya Wellesleyæ perfecta, and Cattleya Maggie Raphael alba.

Messrs. J. Cypher and Sons, Cheltenham, presented a very interesting and attractive group of cypripediums, in which the leading kinds were C. Leeanum Corona, C. Baron Schröder, C. Niobe superba, C. Fulshawense, C. Mrs. F. Sander, C. Actæus superba, C. Thalia gigantea, C. Maudiæ, C. insigne Harefield Hall, and C. i. Sanderæ. Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, showed Liparis longipes bearing a crowd of spikes of pale creamy-green flowers, Bulbophyllum Ericsoni, Phaio-calanthe Colmani, Dendrobium Cœlogyne, D. epidendropsi, etc. Mr. H. J. Chapman, gardener to Mrs. Cookson, Oakwood, Wylam-on-Tyne, sent up Calanthe Cooksoniæ gigantea (A.M.), and Cypripedium Oakwoodiense, the latter somewhat like C. Mrs. F. Sander.

From the Westonbirt collection Mr. H. Alexander, orchid grower to Lieut.-Colonel Sir G. Holford, brought up a fine plant of Lælio-cattleya Arethusa carrying eight flowers; L.-c. Barbarossa, L.-c. Olivia (A.M.), a handsome cross between L. Jongheana and C. Schroderæ; and Cattleya Portia gigantea, with a grand spike of eight flowers. Mr. Walter Cobb, Normanhurst, Horsham, Sussex, brought up Sophro-cattleya Doris Cobb's var. (F.C.C.), a fine flower of rich orange-scarlet hue, and finer than the type. Messrs. Stanley and Co., Southgate, sent a few plants of Cattleya Fabia, C. labiata virginalis, C. labiata, and C. Heloise.

From Messrs. Armstrong and Brown, Tunbridge Wells, came a pretty little display, in which were Cymbidium Lady Colman, Brasso-cattleya Thorntoni var. Boydæ, Odontioda Thwaitesi, Cattleya Fabia, Cypripedium insigne var.—an enormous flower, Dendrobium Cœlogyne, Cypripedium Niobe Westonbirt var., C. Germaine Opoix, C. insigne Sanderæ, and Cattleya Armstrongæ. Mr. Hopkins, gardener to Francis Wellesley, Esq., showed Lælio-cattleya Ville de Bruselles, a fine cross between L.-c. callistoglossa and L.-c. Clive; and Sophro-lælio-cattleya Thalia, a brilliant little orchid, with vivid orange flowers. Mr. A. Young, gardener to C. R. Ashton, Esq., Camden Park, Tunbridge Wells, showed some good orchids, notably Cattleya Luigæ Broadlands var., C. Fabia, C. Armstrongæ, C. Miss Williams, C. Phrygia, Brasso-cattleya Thorntoni, and L.-c. Phœbus, the latter a cross between L. Cappei and L.-c. Iris, and Cattleya Russelliana. Mr. Hale, gardener to S. Larkin, Esq., Ridgeways, Haslemere, sent flowering plants of Cattleya Mantini nobilior, L.-c. eximia, etc. Messrs. W. B. Hartland and Co., Ardcairn, Cork, displayed a considerable group or orchids, and the leading features were Cattleya Brownæ, C. Mantini, C. Paripiti, C. labiata, Cypripedium insigne Sanderæ, C. i. Harefield Hall, C. i. Mrs. F. W. Moore, Cattleya Suavior delicata, Brasso-cattleya Digbyano-Schroderæ, and Odontoglossum Groganiæ.

FRUIT AND VEGETABLE COMMITTEE.

This body had very little work to do, but it evidently found the new apple, Ardcairn Pippin, to its liking, as there were no specimens left a few minutes after the committee had risen.

Mr. F. W. Seabrook, Romsey Abbey, Hants, staged some large heads of Celery Clayworth Pink, which were unbleached and very rough. Messrs. W. B. Hartland and Co., Ardcairn, Cork, submitted apple Ardcairn Pippin (A.M.).

CERTIFICATES AND AWARDS.

First Class Certificate.—To Sophro-cattleya Doris Cobb's variety, from Walter Cobb, Esq. (gardener, Mr. C. J. Salter), Normanhurst, Rusper, Horsham.

Award of Merit.—To Calanthe Cooksoniæ gigantea, from Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne; to Lælio-cattleya Olivia, from Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester; to perpetual carnation Mrs. C. W. Ward, from Mr. G. Lange, Hampton; to Japanese chrysanthemum Victorian, from Messrs. J. Stredwick and Son, St. Leonards; to single chrysanthemum Mr. Frank Hill, from Messrs. G. Williams and Sons, Cardiff.

MEDALS.

Gold.—To Messrs. J. Hill and Son, Edmonton, for exotic ferns.

Silver-Gilt Flora.—To Messrs. Jas. Veitch and Sons, Chelsea, for begonias and chrysanthemums.

Silver-Gilt Banksian. To Messrs. H. B. May and Sons, Edmonton, for ferns and begonias.

Silver Flora. — To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. W. B. Hartland and Co., Cork, for orchids; to Messrs. Carter Page and Co., London Wall, for chrysanthemums.

Silver Banksian.—To Messrs. J. Peed and Sons, West Norwood, for chrysanthemums; to Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to R. G. Thwaites, Esq., Streatham Hill, for orchids; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Mr. Galsworthy, Chertsey, for paintings; to Mr. L. R. Russell, Richmond, for shrubs.

Bronze Flora.—To Messrs. S. Low and Co., Enfield, for carnations and chrysanthemums.

SCIENTIFIC COMMITTEE.

OCTOBER 25.

Present: Rev. Professor Henslow, M.A., V.M.H. (in the chair), Messrs. W. Cuthbertson, C. T. Druery, A. W. Hill, A. Worsley, W. Hales, R. H. Pearson, J. T. Bennett-Poë, E. A. Bowles, Drs. A. Voelcker and F. W. Keeble, and F. J. Chittenden (hon. secretary).

MALFORMED ORCHIDS.—Mr. E. A. Bowles showed two malformed orchids, a dendrobium and a cattleya, both showing doubling of some of their parts. They were referred to Mr. Lionel Crawshay for examination and report.

FERTILITY OF "GREEN" WALLFLOWER.—Professor Henslow said that he found the fruits of this plant to contain numerous fertile seeds, but he had not been able to satisfy himself that the supernumerary carpels formed in place of stamens produced good seed.

FASCIATION IN ROSE.—Mr. W. Patterson sent a fasciated branch of rose from St. Vincent, W.I. He remarked that it had been taken from a bush which had been severely cut back previously. He thought fasciation was somewhat rare in roses, as compared with many other plants.

PEAR WITH LATERAL PROLIFERATION.—Mr. Rogers, of Falmouth, sent a pear which had produced a bud upon its side. This malformation is rather common, and is due to the fact that the fleshy part of the pear is a stem structure.

MACARANGA SACCIFERA. — Messrs. Veitch exhibited, on behalf of M. Louis Gentil, a plant of Macaranga saccifera, a native of the Congo district, belonging to the Euphorbiaceæ, and possessing very curious saccate growths of the nature of stipules, a pair at the base of each leaf. The committee, on the proposal of Mr. Bowles, seconded by Mr. Hales, unanimously recommended the award of a Botanical Certificate.

PLANT BREEDING, ETC.—The Rev. Professor Henslow made some remarks upon the Mendelian phenomenon of segregation. He first drew attention to the fact that dissociation of the characters of the parent plants crossed—when the dominant offspring (F1) was self-fertilised and bore offsprings usually like each parent (F2)—often appeared in the first cross, so that this (F1) was intermediate in characters, as of that of Primula sinensis "Crimson King," with a white (Star) "Lady" variety (Bateson's "Mendel's Principles of Heredity," pl. vi.). Mendel's dissociations appear to be a previously unknown instance. Professor Henslow gave as examples among hybrids the two species of petunia with a purple or violet and white flower respectively, the offspring of which are mostly striped. Cytisus Adami is another case. Of crosses with floral or fruit dissociations he mentioned Azalea indica, the York and Lancaster rose, sweet williams, chrysanthemums, orchids, etc., and the fruit of red and white currants. Another cause of dissociation arose when naturally compound colours, as orange and purple, are crossed with a white variety. Thus the orange Abutilon Darwini and Rhododendron javanicum have supplied reds and yellows. Now the question arises—When one parent is quite divisible and recessive in F1, why is the other dominant? Judging from the examples given in Mr. Bateson's work, the answer is that the dominant characters are mostly, if not always, those of the parent which has the greater geneologicæ, i.e., as representing the original specific type. Thus tallness of stems, round and yellow peas, are dominant in the kitchen pea. The purple and flat standard of the sweet pea are specific and dominant. In fruits, the normal and prickly form of Ranunculus arvensis and of datura are dominant. If, therefore, the species be known as the earliest varieties, such may be expected to supply the dominant characters.

He then read the following note on the influence of starvation on Sex. In the note on this subject, read September 30, it was mentioned that in one of the three-inch pots there were 73 seedlings of Mercurialis annua. Of these, 39 proved to be males and 10 females on August 20. All these were removed. Of the 24 left, 14 bore female flowers by September 23. Of the remaining 10, seven more proved to be also females by October 30. The three remaining died. Hence the 24, when not crowded, developed only female flowers. In another experiment with a six-inch pot there were 45 seedlings. Of these, 27 were males and 18 females, i.e., in the proportion of three to two. These plants grew much taller than in the smaller pots, the males being from 9 inches to 12 inches high, the females from 4 inches to 6 inches, whereas in the three-inch pot they flowered when only about 4 inches.

Cardiff, NOVEMBER 2 and 3.

The twenty-fourth autumn show was held in the Park Hall, an admirable building for the purpose, with the exception that it was too small, and was an admirable display. No other society that we know of offers so many challenge cups for the encouragement of their exhibitors as this; no fewer than fourteen valuable prizes in this form are included in the generally comprehensive prize list. Twenty-nine classes were provided for cut blooms, and amateurs and cottagers here receive much encouragement. This is fully appreciated, and at few shows do the latter stage such high-class produce as here, really remarkable are the cut blooms staged by the latter, and they are bona fide cottagers, and include policemen, masons, painters, and engine tenters. The management is always of the best; the enthusiastic committee, ably led by Mr. Mountney, secretary, work in harmony together.

CUT BLOOMS.

These formed a distinct and attractive feature, the leading class being for eight vases of Japanese, distinct, three blooms of each. A challenge cup, value seven guineas, with a cash prize, was offered. Six competed, making a fine display. Mr. G. W. Drake, 44, Cathays Terrace, Cardiff, was distinctly ahead with huge high quality blooms of the Hon. Mrs. Lopes, fully ten inches in diameter; Reginald Vallis, rich in colour; F. S. Vallis, Master James, very fine white; W. Jinks, Lady Talbot, nine inches across, the premier bloom in the show; and Lady Letchworth Mr. J. Duff, gardener to Mr. F. G. Williams, Bryn Glas, Newport, was a good second with blooms a trifle smaller, but richly coloured; Mrs. A. T. Miller and F. S. Vallis were very fine. Mr. R. Farmer, gardener to the Marquis of Bute, Cardiff Castle, third; and an extra prize was awarded to Mr. W. Young, gardener to Lord Ninian Stuart, Falkland Palace, Fife. For twenty-four incurved, not less than twelve varieties, the Mrs. Courtis challenge cup and a cash prize was offered, and here again Mr. Drake was the most successful, with medium-sized well-finished blossoms, of which the following were the most noteworthy: Godfrey's Eclipse, Harold Wells, Nellie Threlfall, Boccace, Romance, Mrs. F. Judson, Mrs. J. Wynne, Mrs. G. Denyer, Duchess of Fife, C. H. Curtis, W. Biddle, and G. F. Evans. Mr. Farmer was second, with some far larger blooms, but not so well finished. Mr. F. Bible, gardener to Prince Hadzfelt, Draycot Park, Chippenham, was third.

Japanese, in twelve distinct varieties, made a bold display, so good were the blooms staged. Mr. Drake followed up his previous successes by securing the premier award with heavy specimens of Lady Talbot, R. Vallis, Bessie Godfrey, Hon. Mrs. Lopes, and Master James. Mr. A. A. Joy, Cardiff, was second; and Mr. G. H. Brown, gardener to L. E. Treherne, Esq., Coldinglass Park, third.

In the section for amateurs and gentlemen's gardeners the leading class was for twenty-four Japanese, in not less than eighteen varieties. There were five entrants, and the Courtis Challenge Cup was awarded to Mr. Farmer for an exceptionally level set of blooms, of which F. S. Vallis, Hon. Mrs. Lopes, Frank Payne, and Mrs. Faith Moore were the most noticeable. Mr. C. Cook, gardener to H. Cornelius, Esq., Ashcombe Road, Weston-super-Mare, was a good second. The class for twelve Japanese, distinct, was a strong one, so fine were the blooms. Mr. H. H. Allen, Penarth, was the most successful with high-class examples of popular varieties, among which Mrs. R. H. Marsham, pure white, was prominent; Mr. H. Atkins, 154, Llandaff Road, Cardiff, second. Mr. Farmer, with a dozen especially neat examples, won the premier award for incurved. To this exhibit was given the N.C.S. silver medal as the best exhibit in certain classes. Mr. F. Judson, Duchess of Fife, Emblème Poitevine, Buttercup, Mrs. G. Denyer, Mrs. J. Wynne, and Madame Vrembley were the best. For six blooms of any one white variety of Japanese Mr C. Cook was first with Mrs. A. T. Miller, securing the leading position; Mr. S. J. T. Grinter, 1, Penlynch Street, Cardiff, was second, with smaller blooms of the same variety.

Single-flowered varieties receive much encouragement at Cardiff, and for six vases, distinct, Mr. T. Bindon, gardener to — Wallace, Esq., Newport Road, Cardiff, was first with exceptionally good blooms of Altrincham Yellow, Meta, Felix, Edith Pagram, and Captain Allsopp; Mr. H. Matthews, Victoria Road, Penarth, second.

For the best-arranged vase of singles, with not more than three varieties, Mr. Grinton was distinctly first with fine blooms, effectively displayed; Mr. E. H. Elsworth, Llandough Castle, Cowbridge, second.

Classes were provided for the best seedling and for the best chrysanthemum sport, the award being the society's certificate. Many so-called new or improved varieties were submitted, but only one received a certificate. This was the single variety Caledonia.

PLANTS.

For a group of chrysanthemums, arranged with foliage plants, there were but two competitors. An area of 60 square feet is really too small for the production of a good effect. Messrs. G. Williams and Son, Manor House, Cardiff, was first; and Mr. W. Treseder, Cardiff, second. In the division open to amateurs and gentlemen's gardeners there was keen competition in the group classes. For the Thomas Andrews Challenge Cup for chrysanthemums only there were three competitors, and Mr. A. Brown, gardener to the executors of the late James Howell, Esq., Grove House, Cardiff, was first, with dwarf plants, well furnished with foliage, and carrying good blooms; Mr. W. Hatherdale, 53, Shakespeare Street, Cardiff, second.

Floral work is really well done at this show. The best wreath of chrysanthemums, with any foliage, was a magnificent arrangement of pink blossoms on a white base, with suitable greenery and croton leaves. This was shown by Mr. W. Treseder, Cardiff, who also won the premier position for a bouquet of chrysanthemums, a tasteful arrangement of yellow and red, with highly-coloured trails of Ampelopsis Veitchi. An exquisite mass of Odontoglossum Alexandræ, with white heather, also secured for Mr. W. Treseder the leading award in the bridal bouquet class. Mr. P. Thomas, 35, Albany Road, Cardiff, had the best cross, a huge mass of specimen blooms of Elsie Fulton at the base, with a column of small white blossoms.

NON-COMPETITIVE.

Non-competitive exhibits were not numerous, but they were attractive. Messrs. J. Cypher, Cheltenham, had orchids in variety. Vanda cærulea, Cypripedium insigne Harefield Hall variety, C. Sanderæ, C. Fairrieanum, Odontoglossum crispum, Cattleya Bowringeana, and C. Labeady were the more noticeable (gold medal). Mr. J. Basham, Fairoak Nurseries, Bassaleg, sent a most interesting collection of apples and pears in the leading varieties (gold medal). Mr. W. Treseder arranged a remarkable collection of cactus dahlias, quite an interesting and rare exhibit for the time of year (gold medal). Messrs. Clibran, Altrincham, sent a collection of chrysanthemums, including various sections (silver medal).

Bournemouth.

The twenty-fourth annual autumn exhibition of chrysanthemums, fruit, and vegetables was held in the beautiful Winter Gardens, on November 1 and 2. Cut blooms on boards were not quite so numerous as in previous years, but they were of very high quality indeed. The cut blooms, on long stems, arranged in threes, in vases, were splendid, some very massive specimens being staged by Mr. Thomas Stevenson, gardener to E. G. Mocatta, Esq., of Addlestone, Surrey. This class provided for nine varieties, distinct, and Mr. Stevenson proved the winner. Both fruit and vegetables were well staged, and made a fine display. The grapes, apples, and pears being of high quality.

CUT BLOOMS.

For thirty-six blooms, Japanese, not more than two of any variety, Mr. A. E. Usher, gardener to Sir Randolph Baker, Bart., M.P., Blandford, was the winner. He had the following varieties: The Hon. Mrs. Lopes (2), very fine; Reginald Vallis (2), Mrs. R. H. B. Marsham, J. Lock (2), Master James (2), Lady Talbot (2), grand; Eclipse (2), Mrs. A. T. Miller (2), very fine; F. S. Vallis, Rose Pockett (2), Valerie Greenham (2), Master David (2), very fine blooms; Mrs. Norman Davis (2), Bessie Godfrey (2), President Viger (2), J. Peed (2), Sir Frank Crisp, Pockett's Crimson, and Leslie Morrison. Mr. T. Stevenson also staged a fine lot of blooms, fresh and highly coloured, and won second honours, Splendour, Lady Crisp, F. S. Vallis, W. Gee, Lady Talbot, Reginald Vallis, and Walter Jinks being the best blooms in his collection, and very massive they were.

Mr. Stevenson won first award, silver challenge cup, given by the president, in the class for nine vases, three blooms in a vase, distinct. The following are the names of the sorts, and there was not a weak flower; James Lock, Master James, Hon. Mrs. Lopes, F. S. Vallis, Mrs. R. H. B. Marsham, Miss A. Nickol, Mrs. L. Thorn, Walter Jinks, and Willie Rawlins. Mr. Usher was a good second with fine blooms; and third prize was won by Mr. Slark, gardener to G. J. Fenwick, Esq.

Mr. Tompkins, gardener to the Dowager Lady Miller, won the challenge cup presented by Mrs. Telter, for two vases of nine blooms, staging grand examples of Reginald Vallis and Mrs. A. T. Miller. Mr. Tompkins also won first position for six blooms of any white variety, staged on boards, with Mrs. A. T. Miller. For six vases of blooms, three in a vase, Mr. Tompkins also scored with very good specimens. Mr. Barge, gardener to Rev. C. H. Burrows, came in a close second. Mr. E. Cox, gardener to G. S. Duberly, scored for twelve Japanese cut blooms, Mr. Slark being second.

Singles were grandly shown, Mr. Barge winning first honours with a lovely lot of blooms. Mr. Foskett, gardener to Mrs. Ubsdell, and Mr. Barge won first and second prizes respectively for twelve Japanese blooms, staged on boards.

GROUPS AND SPECIMEN PLANTS.

Mr. F. W. Welch, Park Nurseries, Bournemouth, secured the silver challenge cup presented by the chairman of the committee, G. H. Rolls, Esq., J.P., for a group of miscellaneous plants and cut flowers. In this group Coleus Cordelia was a conspicuous feature, as also were begonias, liliums, and orchids. Mr. F. Squire, Lougham, won second place, his group being too crowded. Mr. Slark won for a group of decorative chrysanthemums, Mr. C. Pearce, gardener to Mrs. Ormond, being second.

For three bush plants Mr. Slark was the winner, and also in the local division for three specimens. Mr. Barrett, gardener to E. Howard May, Esq., had the best single specimen. In keen competition Mr. C. Ball, Bournemouth, won with a charming table decoration. Mr. Geo. Garner won first honours for three shoulder sprays in a keen competition, while Mrs. Heath had the best sprays in another division, and also won for a bouquet. Mrs. Shave won in the class for a basket of chrysanthemums. Mr. Heath had the best nine zonal pelargoniums, Mr. Garner being second.

FRUIT.

In the open class for three bunches of grapes, distinct varieties, Mr. G. Garner won first place, Mr. Usher and Mr. C. Barrett coming second and third respectively. In the open class for two bunches of black grapes, Mr. Garner again scored with large compact bunches and berries of Alicante, well finished. Mr. Barrett was second with Gros Colmar, and Messrs. Foster and Stuart third with Alicante. Mr. Pope, gardener to G. L. Pike, Esq., Wareham, scored in both classes for white grapes, staging perfect examples of Muscat of Alexandria. Mr. Barrett was first for two bunches of black grapes in the local division.

Mr. Stevenson had the best four dishes of cooking apples, staging Warner's King, Peasgood's Nonsuch, Bramley's Seedling, and Lane's Prince Albert. Mr. Stevenson also scored in the class for four dishes of dessert apples, and Mr. Usher was first for four dishes of pears.

NON-COMPETITIVE.

Messrs. Cypher and Sons, Cheltenham, for orchids; Mr. Robert Chamberlain, Bournemouth, for floral designs; and the Somerford Nurseries, for carnations, were all awarded gold medals. Silver medals were awarded to Messrs. Charlesworth and Co., for orchids; Messrs. Thurston and Prichard, for miscellaneous plants; Mr. Vincent Slade, Taunton, for zonal pelargoniums; Mr. C. Fay, Southampton, for carnations; and G. H. Rolls, Esq., J.P., for orchids.

Mr. Stevenson exhibited two extremely fine varieties of single chrysanthemums named Radium, deep rich rose; and Beauty, pale lilac and rose. These have a good future, as they are perfect blooms for exhibition or decoration.

National Chrysanthemum Society.

The following notes were unavoidably held over from our previous issue:

AMATEURS.

In the amateurs' section Mr. B. E. Davies, Biddenden, led for a dozen Japanese, distinct, with a fine set, in which the Hon. Mrs. Lopes was prominent; Mr. J. King, East View, Harlow, second. Mr. King was also first for a dozen incurved, in six varieties, and Mr. W. Gooding, Four Elms, Edenbridge, came a good second. The best vase of five blooms of any Japanese variety was a fine set of Mrs. W. Knox, staged by Mr. W. Rigby; Mr. W. M. Heath, Fir Tree House, Woodford, second; and Mr. G. Bowyer, Maybourne, Sydenham, third.

Mr. W. Rigby, gardener to the Rev. A. C. Cooper Marsden, Borstaldene, Bickley, scored for a dozen Japanese in a special class, with handsome flowers of Bessie Godfrey, Rose Pockett, etc.; Mr. C. H. Martin, Raymead, Hendon, second; and Mr. T. W. Stevens, gardener to W. H. Stone, Esq., Laurie Park, Sydenham, third.

Mr. J. W. Harrison scored for a vase of decorative chrysanthemums, and was followed in order by Mr. G. Bowyer and Miss Martin, all of whom showed well. Mr. King and Mr. Bowyer were also first and second respectively for a vase of single varieties.

In the smaller amateurs' division Mr. L. Gooch scored for six Japanese blooms of one variety with noble flowers of F. S. Vallis, Mr. T. W. Stevens and Mr. C. H. Martin following. Mr. Rigby had the best six Japanese blooms, distinct. Other leading exhibitors were Mr. H. W. Edwards, Hackbridge Lodge, Carshalton; Mr. W. H. Hunt, Mr. A. M. Falkner, East Dulwich; Mr. G. Moorman, Hampton Court Palace, and Mr. J. King.

FRUITS AND VEGETABLES.

Mr. A. C. Horton, gardener to T. L. Boyd, Esq., North Frith, Tonbridge, led for three bunches of Gros Colmar grapes, and was followed in order by Mr. W. Lintott and Mr. W. Howe. For three bunches of any black grapes Mr. W. Lintott, gardener to Sir Walpole Greenwell, Marden Park, Caterham, scored with Alicante, finely coloured; Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, second; and Mr. A. C. Horton third. For white grapes Mr. Lintott was first, and Mr. P. Wilkinson second, the former showing Muscat of Alexandria. Mr. A. Basile, Woburn Park Gardens, Weybridge, scored for six dishes of culinary apples, Mr. A. C. Horton coming second, and Mr. W. Lintott third. Mr. Basile was also first for six dishes of dessert apples with fine dishes of popular varieties; Mr. J. W. Harrison, gardener to R. Girvin, Esq., Ashbourne, Sydenham, second; and Mr. W. Lintott, third. For pears, six dishes, Mr. A. Basile was once more to the front, and here he showed Pitmaston Duchess, Durondeau, Marie Louise, Beurre Baltet Pere, Duchess d'Angoulême, and Chas. Ernest in fine form; Mr. Lintott second, and Mr. A. C. Horton third.

Mr. A. Basile was the only exhibitor of a collection of vegetables, and he showed a grand lot of produce, thereby winning the premier award provided by Messrs. Webb and Sons.

Birmingham Gardeners' Association.

"Herbaceous Plants: Some Principles of Planting Etc.," was the subject expounded by Mr. E. H. Jenkins, Hampton Hill, president of the Kingston Gardeners' Association, on October 31. Mr. C. H. Herbert presided over a full attendance of the members, including the two recently-enrolled lady gardeners. Undoubtedly Mr. Jenkins's fame as a writer on herbaceous and allied plants greatly conduced to the large assemblage.

The lecturer, instead of adopting the ordinary course almost generally pursued by exponents of the cultivation of the subjects in question, elected to propound, specifically, the cultivation of certain plants requiring seasonable treatment to ensure the best success. By way of illustration, he selected the Christmas Rose (Helleborus niger), herbaceous pæony, flag iris, Lilium candidum, Anemone pulsatilla, herbaceous phlox, delphinium, pyrethrum, perennial sunflower (helianthus), and œnothera, plants requiring for their successful cultivation a due observance of their respective root actions, whether in the spring or autumn season.

Mr. Jenkins also drew attention to the great importance of horticultural societies accurately differentiating between "kinds" and "varieties," either of flowers, fruits, or vegetables, in their flower show schedules, for the guidance of exhibitors.

At the conclusion an animated discussion took place, in which several pertinent questions were put, and suitably answered by Mr. Jenkins, and to whom a hearty vote of thanks was then accorded.

Cambridge,

NOVEMBER 9 and 10.

The fame which the Cambridge Horticultural Society has so long enjoyed for the great excellence of its autumn exhibitions was fully maintained by the magnificent display produced on this occasion. The Corn Exchange was taxed to its utmost capacity for the accommodation of the exhibits in competition, the merit was high throughout, and the arrangements were remarkable for their completeness, and reflected much credit upon Mr. A. Matthew, the hon. secretary, Mr. F. E. Fordham, the assistant secretary, and the members of the committee.

FIRST PRIZE VASES OF JAPANESE CHRYSANTHEMUMS AT CAMBRIDGE.
Exhibited by Mr. G. Barker.

CUT BLOOMS.

Japanese varieties were so large and finely shown as to constitute a glorious feature. In the great open class for twenty-four blooms, distinct, there was a strong competition, and Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, occupied the post of honour with one of the finest sets of blooms ever placed upon the exhibition stage. The blooms were of the largest size, and superbly coloured and finished, and so uniform that there was not a second-rate example in the set. The varieties were: Lady Talbot, Splendour, Mdme. P. Radaeli, J. H. Silsbury, Mrs. A. T. Miller, Marquis of Northampton, F. S. Vallis, Mary Poulton, Mdme. G. Rivol, Reginald Vallis, Chrys. Montigny, Lilian Hall, Hon. Mrs. Lopes, Rose Pockett, George Mileham, J. Lock, Fred Duck, Francis Joliffe, John Peed, Mrs. E. Crossley, George Hemming, Bessie Godfrey, and W. Gee. Mr. G. Barker, gardener to Miss M. W. Gibson, was a capital second, with blooms of large size, and otherwise highly meritorious. Mr. R. Smith, gardener to G. R. C. Foster, was third with a fine set of blooms. Equally keen was the competition for eighteen blooms of Japanese varieties, and Mr. R. Smith scored with splendidly developed blooms of Mrs. A. T. Miller, Marquis de Venosta, Mme. Carnot. Mme. G. Rivol, Edith Smith, Mrs. F. W. Vallis, Norfolk Blush, Reginald Vallis, and other of the leading varieties. Mr. G. Barker followed a mark or so behind for second place, and Mr. T. Todd, gardener to W. A. Briscoe, Esq., was third with a good set of blooms.

The premier box of twelve Japanese varieties was shown by Mr. R. Smith, whose blooms were characterised by large size, rich colour, and high finish. Mr. E. Dyson, gardener to W. P. Neal, Esq., and Mr. W. Hall, gardener to Sir John Briscoe who were second and third respectively, also staged blooms of much merit. Mr. W. Hall staged finely developed blooms in his first-prize six Japanese, those of G. Mileham 1908, and F. S. Vallis being especially good. Mr. E. Dyson was a capital second, and Mr. J. Wright, gardener to Arthur Matthew, Esq., followed closely for second place, with finely-developed blooms. The best three Japanese blooms were those shown by Mr. W. Hall; and Mr. J. Wright, and Mr. R. Smith were second and third, the blooms throughout being of much merit.

As is customary at Cambridge, incurved varieties were strongly represented, the number of blooms staged being large, and the quality exceptionally high Mr. G. Barker scored in the open class for twenty-four varieties with full-sized blooms remarkable for their high finish. The varieties represented in the set were Duchess of Fife, Romance. Frank Trestan, Godfrey's Eclipse, Mrs. B. Hankey, Miss Nellie Hall, Mrs. G. Denyer, Mme. Malliance. Miss A. H. Hall, Calypso, Miss W. Threfall. Louis Giles, Mrs. Cora Stoop, Daisy Southam, Edwin Thorpe, Godfrey's Reliance, Mrs. J. Wynn, and Clara Wells. Mr. T. Todd was second with good blooms. Mr. G. Barker also obtained premier honours for twelve incurved, with fine blooms of well-known varieties. Mr. T. Todd, a close second. Mr. E. Dyson scored for six, and Mr. T. W. Birkenshaw obtained first place for three.

The competition in the several vase classes was very keen, and the numerous contributions formed an immensely attractive feature. The class for six vases of Japanese, three blooms in each, was a very strong one, and Mr. G. Barker, gardener to Miss M. W. Gibson, occupied the first place with finely-developed blooms of Mme. G. Rivol, Mrs. J. Neild, Rose Pockett, Hon. Mrs. Lopes, Mrs. A. Debono, and Reginald Vallis. Mr. R. Smith, gardener to G. R. C. Foster, Esq., was second with blooms in a high state of development, and Mr. A. W. Taylor, gardener to Sir J. Mackay, was third, with good blooms. In competition for the prizes for six vases of incurved, three blooms in each, premier honours were obtained by Mr. T. Todd, gardener to W. A. Briscoe, Esq., for large, finely-developed blooms, none of which were named. Mr. G. Barker followed very closely for second place. There was a very strong competition in the class for six vases of decorative varieties, and at the head of the large number of competitors was Mr. John Hall, who staged graceful sprays in a high state of development. Mr. A. Pepper, gardener to A. Hurrell, Esq., was second, and Mr. J. Hutchinson third. W. Dobbs, Esq., was again successful in obtaining premier honours in the class for six vases of singles; the vases were tastefully filled with blooms of high quality. Mr. Smith was second wth excellent vases. and Mr. A. Pepper third. Pompons in vases were rather disappointing, and it will suffice to say that Mr. W. Hall was first.

FIRST PRIZE VASES OF INCURVED CHRYSANTHEMUMS AT CAMBRIDGE.
Exhibited by Mr. T. Todd.

PLANTS.

Classes were provided for groups arranged for effect. for specimen chrysanthemums, for salvias, and for begonias and salvias. The last-named were shown in considerable numbers, and in splendid condition, and the large array of specimens produced a highly effective display of colour. The majority of the collections in competition consisted of Salvia splendens, whch has long been in cultivation, and held in high esteem; but one of the collections was formed with the comparatively new Glory of Zurich, which is compact in growth, and, as stated in these pages on several occasions, is exceptionally free in blooming. The specimens staged were well-nigh solid with the brilliant scarlet flowers, and the collection obtained for the exhibitor premier honours. There were seven or eight entries in the class for six begonias, and, as the whole of the plants consisted of Gloire de Lorraine, and were well flowered, they produced a very pleasing effect. Mr. R. Smith scored with medium-sized plants that were well bloomed, and the colour of the flowers highly developed. Mr. T. W. Birkenshaw followed closely for second place, with examples of good size, and very freely flowered, but the flowers, which were above the average in size, were rather pale in colour. Mr. T. Todd, who was third, had medium-sized and freely-bloomed examples.

Specimen plants were mostly bush grown, and of a size suitable for conservatory decoration. They were all remarkable for both leaf and flower development, and did much credit to the cultural skill of the respective exhibitors. Especially noteworthy was the specimen of a single-flowered variety, staged by W. Dobbs, Esq., who has for some years past made a special feature of the elegant singles. The groups arranged for effect were more numerous and of a much higher order of merit than we have seen them at Cambridge for some years past. They were all arranged in a half-circle measuring 10ft. by 5ft., and some degree of formality is inseparable from groups of this character. The formality in this case was in no way objectionable, and the first-prize group was remarkable for the high quality of the individual blooms and for the taste evinced in the arrangement of the marginal belt of fine foliage plants. The plants used in the second prize group had blooms large in size, and high in quality, and the arrangement of the chrysanthemums was a little lighter, but the marginal belt of fine foliage plants were rather weak. The successful exhibitors in the group class were Mr. G. Dyson, Mr. J. Wright, and Mr. F. J. Cook.

FRUITS AND VEGETABLES.

Both fruits and vegetables were so extensively shown as to constitute features of much interest. There was a brisk contest in the grape classes, and many finely-developed clusters were contributed. In the competition for the prizes for Muscat of Alexandria, Mr. T. W. Birkenshaw obtained first with clusters of large size and finely coloured, and Mr. W. Hall was a good second. The successful exhibitors of Alicante were Mr. R. Smith, Mr. Kirkpatrick, gardener to P. L. Hudson, Esq., and in the class for black grapes other than Alicante, Mr. A. W. Taylor was first, and Mr. F. J. Cook, gardener to the Hon. Mrs. K. Thornton, second, both staging Gros Colmar of much merit.

AN EFFECTIVE GROUP OF SINGLE CHRYSANTHEMUMS.
Exhibited by Mr. J. H. Kefford, gardener to Mrs. Joseph Smith, Newstead, Wavertree.

Notwithstanding the unfavourable character of the past season, apples and pears were staged in sufficient quantities to fill a broad table extending nearly the whole length of the spacious Corn Exchange. The chief of the classes provided for apples and pears was for twelve dishes, to comprise both culinary and dessert varieties. The most important of the several collections was that for twelve dishes, and in this Mr. T. Todd obtained premier honours with fine dishes of Warner's King, Loddington, Bismarck, Lord Derby, Lane's Prince Albert, Ribston Pippin, King of the Pippins, Blenheim Pippin, and Washington. Mr. J. H. Ridgwell, Histon, Cambridge, was a close second with fruit that was a size smaller, but highly-coloured and splendidly finished. Mr. Alderman Stephenson third. For six dishes comprising culinary and dessert varieties in equal numbers, the exhibitor last named occupied the post of honour with a collection of great excellence. Mr. A. Lelliott was a capital second. Mr. W. Dunn scored for three dishes of dessert apples with Cox's, Allington, and Blenheim Pippins at their best. Mr. Todd was first in the corresponding class for culinary varieties.

Mr. Todd was successful in obtaining premier honours in the class for six dishes of pears, with excellent examples of Pitmaston Duchess, Beurre Bachelier, Beurre Bosc, Duchesse d'Angoulême, and Doyenne du Comice. Mr. T. W. Birkenshaw second. There were numerous other well-filled classes for pears.

The numerous collections of vegetables made a brave display, and were of much interest as evidence of the success obtained in the cultivation of esculents by growers resident in the district, of which Cambridge is the centre. Mr. E. Pepper was successful in winning the first prize in the class for six distinct kinds, in which the prizes were provided by Messrs. Webb and Sons. He was successful also in obtaining premier honours in Messrs. Sutton and Sons' class for a similar number of kinds. Mr. Kirkpatrick was second in the first of these two classes, and in the second a similar position was occupied by Mr. J. H. Ridgwell. The last-named was at the head of the competitors in the society's class for ten kinds, and Mr. F. J. Cook was a good second. Mr. Todd was first for twelve dishes of potatoes, and Mr. A. W. Taylor was at the head of the competitors in the class for six dishes.

Liverpool.

The thirty-first annual chrysanthemum show, under the auspices of the Liverpool Horticultural Society, was held in the Corn Market on Wednesday and Thursday, November 9 and 10. This society maintains an interesting series of shows during the year, which, although not of great extent, are fairly representative of the more important phases of British horticulture. One sometimes wonders why it is that Liverpool shows have not developed to a greater extent, but it seems that of the city's vast population only a very small proportion are sufficiently enthusiastic to support flower shows, and without a full measure of public support a society cannot run very big shows. However, this year's event was a good one, and congratulations are due to Mr. Harold Sadler, the secretary, and his committee, on a satisfactory outcome of their labours.

CUT FLOWERS.

The most important class was the Challenge Cup class for thirty-six blooms, half of which must be Japanese and the other half incurves. Four very strong entries were forthcoming, and required extremely careful judging. The cup was eventually awarded to Mr. Geo. Haigh, gardener to Sir Wm. H. Tate, Bart., Highfield, Woolton, who staged Lady Talbot, Hon. Mrs. Lopes, White Queen, Master James, Mrs. R. H. B. Marsham, and other good Japanese, with Buttercup, Miss Cora Stoop, Souv. de Wm. Clibran, and other good incurves. Second prize fell to Mr. Jos. Stoney, gardener to Lieut.-Colonel Gaskell, J.P., Roseleigh, Woolton, who also had fine blooms of the varieties already named, F. S. Vallis and Miss Hilda Rowley being other specially fine flowers; third prize was given to Mr. C. Goves, gardener to Sir Gilbert Greenall, Bart., Walton Hall, Warrington.

Eighteen incurves made a good class, although a few of the blooms lacked that depth and globular finish so highly prized in this type. Mr. J. Nisbet, gardener to Miss Robinson, Holmfield, Aigburth, took foremost place, showing Romance, Mr. Barnard Hankey, and Mr. J. P. Bryce among other favourites; Mr. Charles Osborne, gardener to A. Cook, Esq., Holmfield House, Mossley Hill; and Mr. John George, gardener to Thomas Henshaw, Esq., Whitfield House, Roby, were the other winners. In the eighteen Japanese Mr. John George scored in a close contest with three other exhibitors, his flowers being shapely, bright, and clean. Mr. George Haigh was a capital second, and Mr. C. Goves third with a set that just lost a trifle in freshness.

Four nice stands of a dozen incurves found their best exhibitor in Mr. Jas. Clark, gardener to Thos. Clarke, Esq., Allerton Hall, Woolton, and a very neat stand he staged; second place was taken by Mr. Thos. Bailey, gardener to Mrs. E. C. Leventon, Oakfield, Roby; Mr. J. H. Kefford third. Mr. Clark again led for a dozen Japanese, showing very well; Mr. D. McKelvie, gardener to John Stone, Esq., Blacklow, Roby, second. Half a dozen entries for six incurves were a good entry, and here Mr. E. Wharton, gardener to John Findlay, Esq., Maviscourt, Sefton Park, was victor, his blooms of Lady Isabel, Clara Wells, Buttercup, J. P. Bryce, Romance, and Mrs. F. Ashworth being all good; Mr. J. Armitstead, gardener to Mrs. T. A. Vlasto Bonnevaine, Sefton Park, secured second, and Mr. Geo. Osborne third. There were seven entries for six Japanese, Mr. J. Taylor, gardener to F. Bibby, Esq., Hardwicke Grange, near Shrewsbury, scoring; Mr. P. Caunce, gardener to G. Nicholson, Esq., Parkside, Princes Park, Liverpool, coming second; and Mr. Chas. Taylor, gardener to R. D. Holt, Esq., M.P., Sefton Park, third.

For two vases, each containing three blooms of Japanese, all distinct varieties, Mr. William Aindow, Altcar Road, Formby, led with some elegant flowers; Mr. Fred Geary, 20, Breck Road, Anfield, came second; and Mr. William Farmer, 9, Houghton Street, Prescot, third. Mr. Loo Thomson, Ailsa Craig, Formby, had the best three
]

vases of singles, among five entries; Edith Pagram, Metta, and Bronze Pagram were Mr. Thomson's set. John Macfarlane, Esq., Victoria Mount, Oxton, received second; and Mr. G. A. Turner, 29, Alexander Road, Great Crosby, third. Six vases of single chrysanthemums, not less than three varieties, and not more than twelve flowers in a vase, proved to be one of the most popular classes, there being no fewer than seven entries of a high order of merit. The winner was Mr. J. Williams, gardener to C. J. Proctor, Esq., J.P., Boscobel, Oxton, whose flowers were of good size, and choice variety, but a trifle aged and thin in appearance. Mr. J. Nisbet came second with flowers of great size, and Mr. P. Caunce third with a particularly well-staged lot of choice blooms.

Six blooms of any distinct varieties, shown in two vases, made a nice display, entries coming up well. Mr. William Aindow led off with a set of really good quality, all Japs. Mr. Fred Geary following up with three each of Japs and incurves; Mr. William Farmer's third prize lot were all Japs. Mr. Aindow also had the best single vase of three distinct blooms. Three exhibitors staged six vases, each containing three blooms of a Japanese variety, and here Mr. E. Wharton took pride of place, and was followed by Mr. Charles Taylor and Mr. R. Willacy, gardener to F. W. P. Rutter, Esq., Windyknowe, Blundellsands.

PLANTS.

Liverpool has for years been famous for trained specimen chrysanthemums, and this year some very good specimens were exhibited, although not in great numbers. For three specimens, large-flowered, Mr. Thomas Hitchman, gardener to Arthur Earle, Esq., J.P., Childwall Lodge, Wavertree, claimed first prize with three evenly-balanced plants that were models of good culture and training: Mrs. C. Beckett, Hon. Mrs. A. Ackland, and Mrs. J. B. Bryce were his varieties; second prize went to Mr. W. Wilson, gardener to W. Cunningham, Esq., Gorsey Cop, Gateacre. Mr. Hitchman led for one large-flowered specimen, using one of the most perfect specimens we have seen of Mrs. B. Bryce, and also for three staked plants, and again for three trained singles, his plants in this class being as even as could be wished.

Six single chrysanthemums, staked, brought out some well-grown plants, the winner being Mr. E. R. Finch, gardener to W. J. Lockett, Esq., Grassendale House, Grassendale; second prize going to Mr. Geo. Osborne, gardener to Drs. Tisdall and Ingall, Pinbrook Villa, Pinbrook. Mr. J. H. Kefford, gardener to Mrs. Joseph Smith, Newstead, Wavertree, had the best single plant of trained pompon, second prize going to Mr. W. Wilson, gardener to Walter Cunningham, Esq., Gateacre; third, Mr. F. Atkin, gardener to T. W. Wright, Esq., Mossley Vale House, Mossley Hill, Liverpool. There were five capital groups of single chrysanthemums, arranged on sixty square feet of space, and a very effective class they made. The winner was Mr. P. Caunce, gardener to J. Nicholson, Esq., Parkside, Princes Park, Liverpool. His arrangement was excellent the blending and breaking up of bright colours being tastefully carried out. Mr. J. H. Kefford received second prize, his blooms being decidedly finer, but scarcely so many reds and bright shades were used. Third prize went to Mr. George Osborne.

Miscellaneous plants were catered for in classes for winter-flowering begonias, cyclamen, primulas, poinsettias, etc., and a goodly number of exhibits were staged. There were also a number of entries for fruit, including a few good grapes and pears.

NON-COMPETITIVE.

A distinct and most attractive feature of the show was an excellent group of orchids, staged by Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds. Many charming odontoglossums, cattleyas, and oncidiums were included in the group, among which several distinct and pretty hybrid odontoglots were prominent. Well-flowered examples of Odontoglossum grande, and some fine flowers of Cypripedium Sanderæ, with oncidiums and vandas, were also staged. Messrs. Clibrans, Altrincham, put up a splendid lot of vegetables, among which celery, leeks, kohl rabi, gourds, and potatoes were principal items. Fruit of handsome appearance was shown by the Government of British Columbia, the faultless packing of which was, as usual, very noticeable.

Messrs. Dicksons, Lim., Chester, brought a beautiful selection of single chrysanthemums, embracing a great range of cheery colours. About thirty dishes of both culinary and dessert apples were also staged, the quality being of a high standard. Potatoes were the principal feature of the exhibit put up by Messrs. Thos. Davies and Co., Wavertree, such sorts as River's Early Ashleaf, The Factor, Schoolmaster, Evergood, and Sir John Llewelyn being well shown. A bright, well-flowered group of cyclamen was arranged by Messrs. R. P. Ker and Sons, Aigburth Nurseries, Liverpool. The pure whites, salmon shades, and deep crimsons were beautiful in colour and form. A neat batch of extra dwarf chrysanthemums in small pots was staged by Messrs. Middlehurst, 11, Manchester Street, Liverpool, who also brought about thirty dishes of various potatoes.

Apples, packed in boxes, and also on dishes, came from Mr. J. Lee, King's Croft, Bebington; Cox's Orange Pippin, Byford Wonder, Lane's Prince Albert, and other equally popular varieties were shown in excellent form, some handsome fruits of Custard Scarlet being particularly noticeable. Choice pears were also staged in nice variety. An exhibit of splendid chrysanthemums came from Messrs. Wells and Co., Lim., Merstham; Mrs. G. C. Kelly, a new Jap. of delightful colour, described as rosy-amaranth with silvery reverse; Mrs. Richd. A. Witty, a rich bronze, and some other good seedlings were capital.

The Liverpool Orchid Company (Cowan's), Lim., put up a nice table of orchids, the blooms being strikingly fresh and clean. Some massive Japanese and beautiful decorative chrysanthemums were staged by Mr. Norman Davis, Framfield, Sussex. The huge golden flowers of the new Countess of Granard, and the creamy-white Mrs. A. Herbert attracted great attention. Mr. William Rowlands, Childwall Nursery, Wavertree, put up a bank of Begonia Gloire de Lorraine and Turnford Hall. The plants were well grown and very freely flowered.

MEDAL AWARDS.

Gold.—Messrs. Wells and Co., Merstham; Mr. Norman Davis, Framfield; Messrs. R. P. Ker and Sons, Aigburth, Liverpool; Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds; Messrs. Clibrans, Altrincham; and Mr. John Lee, Higher Bebington.

Silver.—Mr. Rowlands, Childwall Nursery, Liverpool; Mr. Middlehurst, Liverpool; The Liverpool Orchid Company; and Messrs. Dicksons, Lim., Chester.

A BEAUTIFUL VASE OF CHRYSANTHEMUM EUREKA (SINGLE WHITE).
Exhibited by Mr. Jos. Stoney, gardener to Lt.-Col. Gaskell, J.P., Roseleigh, Woolton, Liverpool.

Leicester Gardeners' Association.

At the Vaughan Working Men's College, Leicester, the first of a short series of lectures on the potato was given recently by Mr. E. Miles. The attendance was good, and keen interest was shown throughout. The chairman, Mr. George Underwood, spoke in warm terms of the close application and unostentatious work accomplished by the lecturer during twenty-five years of experiments in cross-fertilising, which would one day vindicate themselves. A rapid review of the chief popular varieties during sixty years aroused pleasant memories, and was much enjoyed. The "old stagers" present evidently felt special interest in the promising offspring of the old Red Regent, Early Shaw, Lapstone Kidney, Victoria, etc. A few of these old-time favourites had been purposely grown for the hybridiser in the United States, to rejuvenate them. Some reference to the recent "boom" was inevitable, and certain varieties, as well as boom methods, came in for scathing criticism.

National Hardy Plant Society.

The first general meeting of this society was held at the Hotel Windsor on Thursday, November 3, Mr. A. J. Macself in the chair. The Chairman presented the report of the Provisional Committee appointed at Shrewsbury, which dealt with the Edinburgh meeting, and submitted draft rules and bye-laws which the secretary had prepared, and were recommended by the committee to adoption. After several minor amendments, on the motion of Mr. John Collingridge, seconded by Mr. Went, the rules and bye-laws were adopted. The following officers were then elected: Chairman of Council, Mr. A. J. Macself; vice-chairman, Mr. Went; treasurer, Mr. Brunton; secretary, Mr. F. Bouskell. A representative council of forty-eight was then elected. An invitation was received from Sir Frank Crisp for the society to visit Friar Park during next summer. The invitation was accepted, and a hearty vote of thanks accorded to Sir Frank Crisp for his kindness. The Secretary announced that the Earl of Onslow, K.C.M.G., and Mr. John Collingridge had accepted office as vice-presidents. It was desired that members should bring the objects of the society before their friends, and that anyone interested in hardy flowers would communicate with the secretary, Mr. F. Bouskell, Market Bosworth, Nuneaton. It was resolved that a vote of thanks be accorded to the officers and Provisional Committee for their preliminary work in connection with the formation of the society.

Bath Gardeners' Society.

Mr. A. E. Marshall presided over a good attendance of members at the fortnightly meeting of this society, which, as usual, was held in the Oddfellows' Hall. After the usual preliminaries Mr. W. Clark read an instructive paper on "Salads."

Mr. Clark, at the outset of his paper, alluded to the increasing demand for salads, but intimated that he would confine his remarks to the culture of green salads all the year round. The lettuces, of course, held premier place as a salad, and to grow them crisp and succulent it was necessary to prepare the ground well by digging and manuring some time previous to sowing the seed. There were different textures of soil, and the quality of the lettuce depended, to a great extent, upon the quality of the soil. The position for an early crop should be that of a south border, and a place sheltered from the east and north was one of the best positions for an early crop in spring. The ground should be lightly forked over, and a few handfuls of lime added. The ground was then ready for drilling, and the spaces between the rows naturally varied according to the variety of lettuce sown. Seeds should be sown rather thinly, as overcrowding meant weak plants. When the seedlings were strong enough to handle they should be thinned out about nine inches apart. Of course, gardeners were dependent, to a great extent, upon the nature of the seasons, but much could be done by transplanting. If, however, they wished for a good crop of lettuce all the year round it was necessary to sow at least once a fortnight. With regards to the autumn and winter supplies more forethought was required, and for the former crop he generally commenced on July 28. Plenty of fresh air was necessary if damping was to be prevented; at no time throughout the seasons should lettuce be allowed to become dry at the roots. They should be watered in the morning, as evening watering often attracted the cold during the night, but when the nights became warmer evening watering was desirable, as it assisted the growth. For the winter supply he would sow about August 12, and when the plants were strong enough to handle they should be lifted out of the ground and transplanted into cold frames about eight or nine inches apart. Seedlings during the winter months were very liable to damp and rot in soft soil. This crop would carry them well on into the winter, and planting, of course, should be done according to requirements. Yet another sowing should be done on September 1. This time seedlings did not grow so fast, and probably would not be strong enough to handle until the middle of October. When that time arrived they should be thinned out, and sufficient left in the beds to stand over the winter. The others should be transplanted into firm soil in cold frames four or five inches apart. They should be protected from heavy rains, but they should have plenty of fresh air. If there was a break in the supply, a crop of seedlings could be advanced in cold frames fixed in an empty pit. The next salad in importance was the endive, which he always saved for the winter; but as long as lettuce, the queen of salads, could be supplied there would not be much demand for the endive. In his opinion the broad-leaved variety was the best for a continuous supply. Before concluding, Mr. Clark commented briefly upon the cultivation of several other salads, including sorrel, watercress, and lamb's lettuce. A short discussion followed.

Points for exhibits were awarded as follows: Mr. W. C. Evans, vegetables 6, fruit 6, cut flowers 4, pot plants 4; Mr. W. Griffen, six pot plants 6; Mr. W. Clark, salads 6, and grapes 6. This competition is for the silver and bronze metal.

Haywards Heath Horticultural Society.

This society held its fourteenth annual chrysanthemum show at the Public Hall on November 1 and 2. The entries in the fifty-one classes exceeded 200, and the quality of the exhibits left nothing to be desired.

There was a keen fight for the handsome challenge cup, presented by the President of the society for the best group of chrysanthemum plants arranged for quality and effect. Mr. W. Evans, gardener to Mrs. Stewart Mackenzie, Warninglid, was placed first for a fine, well-built group; Mr. E. W. Haywood, gardener to Lord Denman, Balcombe, second. In the class for a miscellaneous group, Mr. W. F. Elvy, gardener to R. Foster, Esq., Summer Hill, Lindfield, was first with a tasteful display, and Mr. E. W. Haywood came second. In the single-handed gardeners' class for a group of chrysanthemums, Mr. Hatfield was first, Mr. C. Ford second, and Mr. W. Fox third.

In the class for six winter-flowering begonias, there was only one exhibitor, this being Mr. W. F. Elvy, who had a fine half-dozen Gloire de Lorraine, which measured about 3½ feet through, and the same in height, and were well flowered from top to base. They were given the first prize, which they thoroughly deserved.

The ladies' table decorations were very pretty, and a fresh feature in the show was a collection of wild fruits, named, shown by children.

The collections of vegetables were good. Mr. T. Cottington, gardener to Mrs. R. Wyatt, was first; Mr. Shirley, gardener to Rev. T. Wyatt, second; and Mr. J. Mitchell, gardener to Miss Maberly, third.

The chief prizewinners in other classes were: Messrs. W. Evans, E. Haywood, W. F. Elvy, J. Shirley, R. Hamper, J. Perrett, G. Smith, J. Cottingham, C. Harris, J. Sands, J. Sinnock, etc. Among non-competitive exhibitors, Mr. J. Box, Lindfield, put up an attractive group of cut chrysanthemums and plants, and was awarded a Certificate of Merit. Messrs. J. Cheal and Sons, Crawley, filled a table with a good display of fruits and single dahlias.

GARDENING APPOINTMENTS.

Mr. J. J. Thompson, of Holker Gardens, Cark-in-Cartmel, has been appointed head gardener to his Grace the Duke of Devonshire, at Compton Place, Eastbourne, and enters upon his new duties on January 1, 1911.

Mr. G. Wareham has been appointed head gardener to F. H. T. Jervoise, Esq., at Herriard Park, near Basingstoke.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advice us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

BASIC SLAG.—K. G., Grantham: Apply basic slag at the rate of four ounces per square yard as the work progresses.

MANAGEMENT OF TENNIS LAWN.—G. K. B., West Bromwich: A handy book that will give you the information you need is "Lawns and Greens," to be obtained, post free, for 1s. 2d. from the GARDENERS MAGAZINE office, 148, 149, Aldersgate Street, E.C.

NERINES.—S. G. A., Leamington: Your query came too late for us to deal with it in our issue of November 5, but as in that issue, page 869, we published an article on Nerines, we refer you to it for the needed information.

NATIONAL SWEET PEA SOCIETY'S CHALLENGE CUPS.—S. W. T., Exeter.: We understand that the challenge cups offered for competition by the National Sweet Pea Society are held by the winners for one year, a guarantee for their safety during that period being given by the holders. In the event of either of the challenge cups being won by a professional gardener the trophy will be held for the year by his employer. In those cases where a gold or silver medal accompanies the trophy the medal will become the absolute property of the gardener, provided he himself is a member of the National Sweet Pea Society.

VARIEGATED CHRYSANTHEMUM.—T. M., Halesowen: The variegation has proved persistent, and has not deteriorated since last you sent specimens. The flowers are fairly attractive, but the merit of the plant lies in its variegation. Of course, a variegated-leaved chrysanthemum is not new, but yours is especially good in this direction. The plant is not particularly valuable, considered financially, but no doubt some nurseryman would be glad to purchase and distribute the stock, but you must have it in first-rate condition before offering it.

WOODEN LABELS.—A. R., Tiverton: When the labels have been cut into sizes, and properly shaped and smoothed, give them a complete coat of white paint, and allow this to dry quite hard. Afterwards put a thin coat of paint on the part of the label that is to carry the plant name, and then write the name clearly and boldly with a garden pencil. This entails rather more labour than the usual practice, but the name is more legible, and the labels last far longer than when only the writing surface is painted.

FOLIAGE PLANTS FOR A COLD CONSERVATORY.—R. T., Redhill: There is a large range of subjects to select from for the purpose of making even a cold conservatory bright during the winter months. The whole of the evergreen hardy ornamental shrubs may be laid under tribute, but in making a selection some consideraton must be paid to the district, and to the amount of light the plants will receive. In dull smoky districts and under grimy glass coniferous shrubs would not be a success, but if the light and air are good then small plants of golden and silver variegated cupressus should be chosen, as well as coloured yews and hollies, all these being carefully lifted

BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich.

CLAY'S SUCCESSFUL GARDENING.—A thoroughly comprehensive, informing, up-to-date Publication. 276 pages, illustrated, bound in cloth. To be obtained of Seedsmen, etc., NINEPENCE NET, or Free by post for this amount direct from the Publishers as under:—

CLAY & SON, Manure Manufacturers and Bone Crushers, **Stratford, London, E.**

and placed in pots or tubs. Many of the hardy bamboos could be pressed into service, as well as the variegated New Zealand Flax (Phormium tenax variegata). Euonymuses in variety, Veronica Andersoni variegata, Fatsia (Aralia) Sieboldi, bright-leaved eleagnuses, and the many beautiful tree ivies in bush or standard form, may all be used. One palm, Trachycarpus excelsa, may be utilised, and the hardiest of the evergreen ferns would also serve.

LORD SUFFIELD APPLES.—R. E., Finchley: There appears to be no cause for the decline of the Lord Suffield apples other than that of natural decay. The variety is an early one, and unless there are very special means for keeping the fruits these speedily decay if kept long.

DAMAGE TO PRIVET.—C. L., Staines: The damage is entirely due to the burning action of the hot fermenting manure while in contact with the privets. Some boards or a piece of sheet iron should have been placed in front of the hedge to shield the plants from the newly-carted manure. If the injured plants are cut down close to the ground they will throw up new growths next year, provided they have not been too badly treated, but probably the best plan will be to lift out the injured specimens and plant other good ones in their places at once.

NAMES OF FRUITS.

J. P., Whittlery.—Gravenstein.

G. A., Bicester.—1, Annie Elizabeth; 2, Cox's Pomona.

W. N., Bude.—1, Cox's Pomona; 2, King of the Pippins.

W. N. G., Chislehurst.—1, Warner's King; 2, Golden Noble.

J. H. C., Plymstock.—Not recognised; an apple of no value as submitted.

R. H. D., Sutton.—1, Peasgood's Nonsuch; 2, Lane's Prince Albert; 3, Court Pendu Plat.

F. E. J., Oxford.—1. Gascoigne's Scarlet; 2, Tower of Glamis; 3, Chelmsford Wonder; 4, Hollandbury.

D. L. R., Hastings.—1, Allen's Everlasting; 2, King of the Pippins; 3, Newton Wonder; 4, Wealthy.

G. M. S., Beccles.—1, Waltham Abbey Seedling; 2, Stone's; 3, not recognised, poor specimen; 4, Beurre Diel.

L. S. O., Shrewsbury.—1, Claygate Pearmain; 2, Fearn's Pippin; 3, not recognised; 4, Probably a small example of Lord Derby; 5, Beurre Bosc.

NAMES OF PLANTS.

I. W., Aylesbury.—Vaccinum Vitis-Idæa.

H. B., Southminster.—Leycesteria formosa.

S. E., Lewes.—1, Caryopteris mastacanthus; 2, Restrepia antennifera.

A. M. T., Derby.—1, Symphoricarpus racemosus; 2, Mackaya bella; 3, Maranta zebrina.

G. P., Hull.—We do not recognise the variety as sent; send specimens rather earlier next year.

N. C. A., Netherbury.—1, Plumbago capensis; 2, Cypripedium insigne; 3, Odontoglossum ardentissimum.

A. P. R., Rochester.—1, Cotoneaster rotundifolia; 2, Berberis Darwini; 3, Diplopappus chrysophyllus; 4, Olearia Haasti; 5, Ligustrum lucidum; 6, Pernettya mucronata.

CATALOGUES RECEIVED.

MANSELL AND HATCHER, RAWDON, YORKS.—An illustrated catalogue of orchids with cultural hints. The list is specially prepared for amateurs commencing to cultivate orchids.

M. VIGNERON, OLIVET, ORLEANS, FRANCE.—A small catalogue of the newer roses. Mr. E. Schneider, Ifield Road, Fulham Road, S.W., is the British agent for the firm.

LAXTON BROS., BEDFORD.—A most interesting catalogue of fruits, special interest attaching to the coloured plate and descriptions of new fruits now being introduced by the firm.

H. LANE AND SON, GREAT BERKHAMSTED.—Two catalogues have reached us from this firm, one devoted to hardy trees and shrubs, rhododendrons especially; and the other to fruit trees and roses.

W. J. UNWIN, HISTON, CAMBS.—A descriptive catalogue of sweet peas, including a number of fine novelties, and a coloured plate.

Situations Wanted.

MR. E. R. BEVAN highly recommends his late HEAD GARDENER; 13 years in his service; life experience in all branches; most capable and trustworthy; 39; married, one child. H. KING, Rempstone, Corfe Castle.

GARDENER (Head); life's practical experience in all branches, Inside and Out. Grapes, Peaches, Melons Stove and Greenhouse Plants, Malmaison and Tree Carnations, Orchids, Chrysanthemums, Landscape, and Rock Garden, Vegetables and Hardy Fruits; nearly eight years as head of six; excellent references; age 35. F. SMITH, 4, Mellish Terrace, Morden, Surrey.

GARDENER (Head Working where two or more are kept); experienced in all branches; 12 years' excellent reference as Head; left own request; age 45; two in family, youngest 15. HUNT, 9a, Bridewell Street, Devizes, Wilts.

GARDENER (Head Working or Single-handed); life experience in Fruit, Flowers, and Vegetables, both Inside and Out; excellent references; disengaged; married, three in family. PEARCE, Herriard, Basingstoke.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here 5½ years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working); life good practical experience in all branches, Inside and Out, Early and Late Forcing; excellent references. H. TURNER, 62, Star Road, Peterborough.

GARDENER (Head Working); 24 years' practical experience in the cultivation of Flowers, Fruit, and Vegetables Inside and Out; good conception in the alteration and improvement of Gardens and Pleasure Grounds; six years' excellent character; married; age 39. SQUELCH, Keston, Hayes S.O., Kent.

GARDENER (Head Working), age 45; married, no family; experienced in all branches (Inside and Out); excellent testimonials. WM. SMITH, care of Mrs. Clibury, Weather Lane, Astley, Stourport.

GARDENER (Head Working), requires SITUATION; experienced in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants; Flower and Kitchen Garden, Hardy Fruit, etc.; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head Working) requires SITUATION; experienced Vines, Peaches, Melons, Fruit, Flowers, Vegetables; 5 years' good character; married. C. N., Clarence Cottage, Broadbridge Heath, Horsham.

GARDENER (Head Working where one or more are kept); thoroughly experienced in all branches, Inside and Out; age 36; married; good references. EVANS, Dinmore Hill Leominster.

GARDENER (Head Working); age 44; life experience; 21 years' excellent references from first-class establishments; thorough knowledge in all branches; leaving own request; no young children, youngest 14. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head Working, where one or more are kept, or good Single-handed); experienced Inside and Out; good references; abstainer; married; age 29. W. S., Office of this Paper.

GARDENER (Head Working, where two or more are kept); good all round; can be well recommended; married when suited; age 36. PEARCE, 10, Roxwell Road, Shepherd's Bush.

WANTED, SITUATION as HEAD WORKING GARDENER where two or more are kept; lifelong experience in all branches, inside and out; also landscape work; Churchman; abstainer; excellent references; married; one child; North of England preferred; age 30. Apply GARDENER, care of Hy. Wardhaugh, Shotley Bridge, Durham.

GARDENER (Head or good Single-handed), experienced Inside and Out; age 36; married, no family. M., North Road, Lancing, Sussex.

GENTLEMAN recommends GARDENER Head of two or three; life experience in all branches; understands formation of new or renovating old gardens; married, one boy 10 years; age 45. PENNELLS, Phœnix Green, Winchfield, Hants.

GARDENER (Single-handed or otherwise); good all-round man in all branches, or handy man on gentleman's estate; good at either; willing to be useful; active and reliable; good character; age 45; married, one child. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER (Single-handed or otherwise); age 39; single; experienced Inside and Out; willing to be useful; excellent character. GRIFFITHS, 17a, Eynham Road, Shepherd's Bush, London, W.

GARDENER (Second); 14 years' experience in Vines, Peaches, Orchids, Greenhouse, Lawns, Kitchen and Flower Gardens; age 27; good references; married. HOLT. Bankside, Malcolm Road, Coulsdon, Surrey.

MANAGER or FOREMAN (Working); age 40, married; abstainer; life practical experience in Trade and Market Nurseries, growing Palms, Ferns, and General Pot Plants, Roses, Chrysanthemums, Cucumbers, Tomatoes, Grapes, Bulb and Valley Forcing; good at Making-up. MANAGER, 4, Bampfield Street, Portslade, Sussex.

FOREMAN or SECOND, Inside or Inside and Out; experience in all branches, Fruit and Plant Houses; well recommended from present and previous places; one year and nine months here as Foreman; age 27, married, one child. SHILL, The Gardens, The Lilies, Aylesbury, Bucks.

FOREMAN (Inside or Second, where several are kept); age 27; 12 years' experience; six in last place; highest references, etc. J. WHEAT, Great Glenn, Leicestershire.

GENTLEMAN recommends YOUNG MAN, age 22, as Second of four or five; Inside and Out; 7 years' experience; good reference. Apply T. ROGERS, Michelmersh, Romsey, Hants.

GARDENER; good all-round; middle age; 25 years' good references; wife take charge of house when family away; clergyman's references. SEX, 2, Radley Lane, S. Woodford, Essex.

M. MEREDITH BROWN, Esq., strongly recommends young man as JOURNEYMAN (Second, Inside); 3½ years present place; age 20. F. GEE, Westbrook, Bromham, Chippenham.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Autumn Exhibitions.

The exhibitions that have been held during the present month have, as a whole, been highly successful, and those who fully appreciate the importance of the competitive gatherings that belong to the second half of the autumn season, can hardly have failed to derive much gratification from the spirited contests and the high quality that were evident on all sides. Remembering what has been accomplished in the corresponding period of some previous years, we do not regard the present season as having established a record, but we suggest that it is one of the most satisfactory within recent years. Chrysanthemums, if not equal in every respect to those shown when these flowers were at the zenith of their popularity, were staged in larger numbers than for some years past, and in merit they were considerably above the average of the past decade. From the opening of the chrysanthemum season at Brighton to the great exhibition which was held in the Waverley Market during the second half of the past week, the several classes of flowers have been splendidly represented. The exhibition of the National Chrysanthemum Society was, as duly recorded in these pages, the finest the society has held for some years past. The blooms of Japanese varieties have for the most part been large in size, bright in colour, and high in finish; and the incurved varieties have been remarkably well shown. In the latter there was a marked improvement, owing evidently to a fuller appreciation on the part of cultivators of high finish, so essential in the case of the incurved blooms. It is satisfactory to be able to record that much interest continues to be taken in what is commonly known as the decorative sections, as the result of the increased provisions that are now made for them at the principal exhibitions. At Brighton, Bradford, Cambridge, Hitchin, York, and some other of the principal exhibitions at which we have had the pleasure of being present, the single and double varieties specially adapted for decorative purposes have been so largely and tastefully staged as to constitute features that were attractive and of much educational value. Groups have been somewhat at a standstill, and in many cases have failed to attract attention commensurate with their merits. It might be well, in some instances, to make a change, and for a season or two invite groups of naturally grown decorative varieties. There is no way in which they appear to greater advantage than in tastefully arranged groups, and such groups would be appreciated by visitors after enjoying to the full the large display of exhibition blooms of Japanese and incurved varieties that is usually provided. While it is quite proper that the National Chrysanthemum Society should devote the whole of its energies to the extension and improvement of the cultivation of chrysanthemums and the encouragement of raisers of new varieties, it is important that provincial societies holding exhibitions in the autumn should consider whether it would not be advantageous to them to make their annual gatherings more comprehensive than is frequently the case. From close observation over a wide area, we have no doubt upon this point. We have had ample evidence on all sides that those societies have been the most successful which have made their exhibitions more varied by providing classes for winter-flowering carnations, begonias, primulas, Roman hyacinths, lily of the valley, salvias, and other things that might be mentioned. The chrysanthemum in its varied forms should be the paramount flower at the autumn exhibitions—and so far as possible the prizes should be sufficient to afford adequate encouragement to cultivators. In the case of the leading provincial societies it would be an advantage to provide open classes with prizes sufficiently liberal to induce cultivators from a distance to take part in the competition. With regard to providing classes for miscellaneous subjects, such as those mentioned, it need hardly be said that all the skilful cultivators in a district do not grow chrysanthemums for competitive purposes, but they may grow carnations or some other of the flowers mentioned to a high degree of perfection, and in giving them an opportunity of displaying the products of their skill their interest in the society and its work is stimulated, and the exhibition is rendered more attractive to the general public. Beyond that the cultivation of flowers of a high degree of utility for decorative purposes at a dull season of the year is encouraged. Especially does it appear desirable that societies should provide such classes for perpetual-flowering carnations as would ensure their full representation to give visitors an opportunity of becoming acquainted with the best varieties. Knowing how plentiful are the easily-grown orchids flowering at this season of the year, it is difficult to repress a feeling of surprise that these fascinating plants so seldom have classes provided for them in the schedules of the autumn shows. Twenty years or so ago they were liberally encouraged by the Brixton Hill Chrysanthemum Society, and they were so largely shown as to form a glorious feature; and, with so much additional material at com-

MR. G. P. BERRY.

mand, as the result of the activities of the hybridists, it is reasonable to infer that even finer displays might be produced at the present time than was possible at Brixton Hill two decades ago. A few societies provide one or two classes for palms, and it would be an advantage were the practice to become more general, for a few palms judiciously placed on the stages devoted to cut blooms of chrysanthemums add very greatly to the general effect by preventing the air of monotony that pervades tables devoted wholly to cut flowers. We might write at length of the importance of providing sufficient classes to ensure a large display of fruit and liberal contributions of vegetables, but we have said sufficient to show that we consider it essential that the shows held in the autumn should include all the products of the plant house and garden that are suitable for exhibition at that season.

Mr. G. P. Berry, whose portrait is given herewith, is one of the foremost of the many able men engaged in giving instruction in horticulture, and occupied a prominent position among those who contributed to the success of the Northern Counties Fruit Congress, recently held at Hexham. To Mr. Berry was given the honour of delivering the opening address at the first of the six meetings that were held during the three days over which the Congress extended, and he fully justified the course taken by the committee in the preparation of the programme. His address was on "Fruit Storage and Fruit Bottling," and in this he afforded unmistakable proofs of his being thoroughly acquainted with both the scientific and practical sides of these two important methods of keeping the various kinds of fruit for use some time after it has been gathered. Mr. Berry had for the purpose of the Congress prepared a paper, in which the various points were set forth in considerable detail, but, instead of reading it, he gave a summary, and this was so remarkable for its clearness and fulness of information as to evoke the warmest expression of approval from the large audience. He was not less successful in the part taken in the discussion that followed the reading of papers at subsequent meetings. At the present time Mr. Berry is the Horticultural Instructor to the Edinburgh and East of Scotland College of Agriculture, and his advisory work extends over a large area in the East of Scotland. For some years previous to occupying his present position, he was Horticultural Instructor to Armstrong College for the four northern counties of England. Previous to engaging in educational work of a public character, Mr. Berry was several years in the gardens of Gordon Castle, the Scottish seat of the Duke of Richmond and Gordon, under that able gardener, Mr. Webster, and, judging from his subsequent career, he was careful to take full advantage of the opportunities he had for the acquisition of a thorough acquaintance with the science and practice of horticulture.

Hardy Trees and Shrubs at Syon House.—We have much pleasure in acknowledging a copy of the catalogue of hardy trees and shrubs growing in the grounds of Syon House, which has been compiled by Mr. A. Bruce Jackson, for it is a model of what such a catalogue should be, and a pleasant reminder of the important part these great gardens have taken in maintaining an interest in the ornamental aspects of arboriculture. There is an MS. catalogue in existence which was compiled in 1849, of the trees and shrubs at Syon, and in this there are particulars of over 800 specimens. This catalogue cannot, however, be considered a guide to the collection as it exists at the present time, for many of the trees have died, and additions have been made. The catalogue now before us is, the author states, the outcome of a careful survey of the grounds made in the autumn of 1899 at the request of the Duchess of Northumberland. All the trees have been re-measured with Stanley's apocemometer, and the identification carefully checked, and it is interesting to compare the measurements of the more remarkable specimens with those given by Loudon in his "Arboretum et Fruiticetum Britannicum." The nomenclature is remarkable for the care that has been taken to ensure its correctness,and the notes accompanying the names of the several hundred trees are of much interest. The catalogue is published by Messrs. West, Newman, and Co., 54, Hatton Garden, London, and Mr. A. Bruce Jackson may be heartily congratulated on the success he has achieved in its compilation.

Mr. Frank Cant, whose fame as a rosarian is well known throughout the United Kingdom, and indeed beyond its boundaries, has been elected Mayor of Colchester, and his election by the members of the Corporation to this important position is immensely popular among all classes of the community resident within the borough. During the past nine years Mr. Cant has represented the North Ward in the Borough Council, and has rendered excellent service during this period, more especially as a member of various committees. The Deputy Mayor, in proposing the election of Mr. Cant, said they all knew and appreciated the splendid work he had accomplished on behalf of his native town, and they recognised in him a business man of great ability and an able and honourable colleague, who had the courage of his convictions, and also the most genial of temperaments. So far as we are aware, Mr. Cant is the first professional rosarian who has had the honour of occupying the high position of Mayor in his native town, and we wish him a pleasant and successful year of office.

National Chrysanthemum Society.—We would remind our readers that the annual dinner of the National Chrysanthemum Society will be held at the Holborn Restaurant on Tuesday, November 29. The President, Sir Albert Rollit, D.C.L., LL.D., will preside, and the function is fixed at 6.15 for 6.45 p.m. Tickets for the dinner, 5s. each, may be obtained from the Secretary, Mr. Richard A. Witty, 72, Savernake Road, Gospel Oak, London, N.W.

Rockery Margin to Strawberry Bed.—Of late years much has been done with a view to make the quarters devoted to fruits and vegetables attractive as well as useful, and we have illustrated several kitchen gardens in which herbaceous plants have been used with good effect. We have now the pleasure of giving (page 917) an illustration of a rockery margin to a strawberry bed, and the charming effect produced is so admirably shown as to render description unnecessary. The ground on which the strawberry plants are growing is considerably above the general level, and it was a good idea to form a margin of rockwork to keep the soil in position, and then to furnish it with plants that happily combine freedom of growth with floral beauty.

Presentations at Paris.—At the luncheon given to the jury at the recent International Chrysanthemum Show and Congress at Paris, Sir Albert Rollit, President of the National Chrysanthemum Society, in a most eloquent speech, publicly thanked M. Viger, President of the National Horticultural Society of France, and M. Max de la Rocheterie, President of the French Chrysanthemum Society, for their hospitality and kindly welcome to English Chrysanthemum men visiting the French shows during the past few years. Sir Albert presented to each of these gentlemen the silver-gilt medal of the N.C.S., as a small token of his high appreciation of their kindness, and promised that at the next annual meeting of the N.C.S. the title of honorary member of the society should be conferred upon them.

Small Fruits in Great Britain.—According to the official returns for the current year, the area under small fruits in Great Britain has declined for the first time since 1898, the decrease amounting to nearly 3,000 acres, or 3 per cent.

Coventry Flower Show.—We regret to learn that the financial results of the exhibition held by the newly-constituted Coventry and Warwickshire Horticultural Society in the course of the past summer were so unsatisfactory that the committee have had to face a deficit of £150. Fortunately, they have a guarantee fund of £73 to fall back upon, which it has been decided to call up, and this, with some other amounts that have been obtained, will reduce the deficit to be met by the committee to £25. It was prudent to have a guarantee fund, but it appears to us hardly wise to have held a flower show, especially the first, on lines involving an expenditure of considerably over £500, with a subscription list of less than £100. Of the desirability of having an annual horticultural exhibition in an important centre such as Coventry, there can be no doubt, but to avoid the unpleasant experiences of this year the speculative element should be eliminated by obtaining a much larger subscription list. It was unanimously decided to clear up this year's accounts before entering into arrangements for another exhibition.

Horticultural Club.—The next house dinner of the club will take place on Tuesday, the 22nd inst., at six p.m., at the Hotel Windsor, when Mr. W. W. Pettigrew, superintendent of the Cardiff Public Parks Department, will give a lecture on "The Aim and Scope of a Public Parks Department." The lecture will be illustrated with lantern slides.

Nerine Crosses.—Mr. A. Worsley showed a spike of Nerine Haylocki at a recent meeting of the R.H.S. Scientific Committee, to illustrate the fact that reciprocal crosses are not always of precisely the same nature. N. Manselli is the result of the reciprocal cross in this case, but it differs in colour from N. Haylocki. Dr. Keeble pointed out that such differences may arise because the pollen may not carry the chromoplasts. In addition to this, it is not certain that the same forms of the species were used in the making of both crosses, and if different forms were used the result would naturally be different.

"**Plants in Congenial Positions**" is the subject of a lecture to be delivered before the Royal Horticultural Society on Tuesday next, November 22, at three o'clock, by Mr. James Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton.

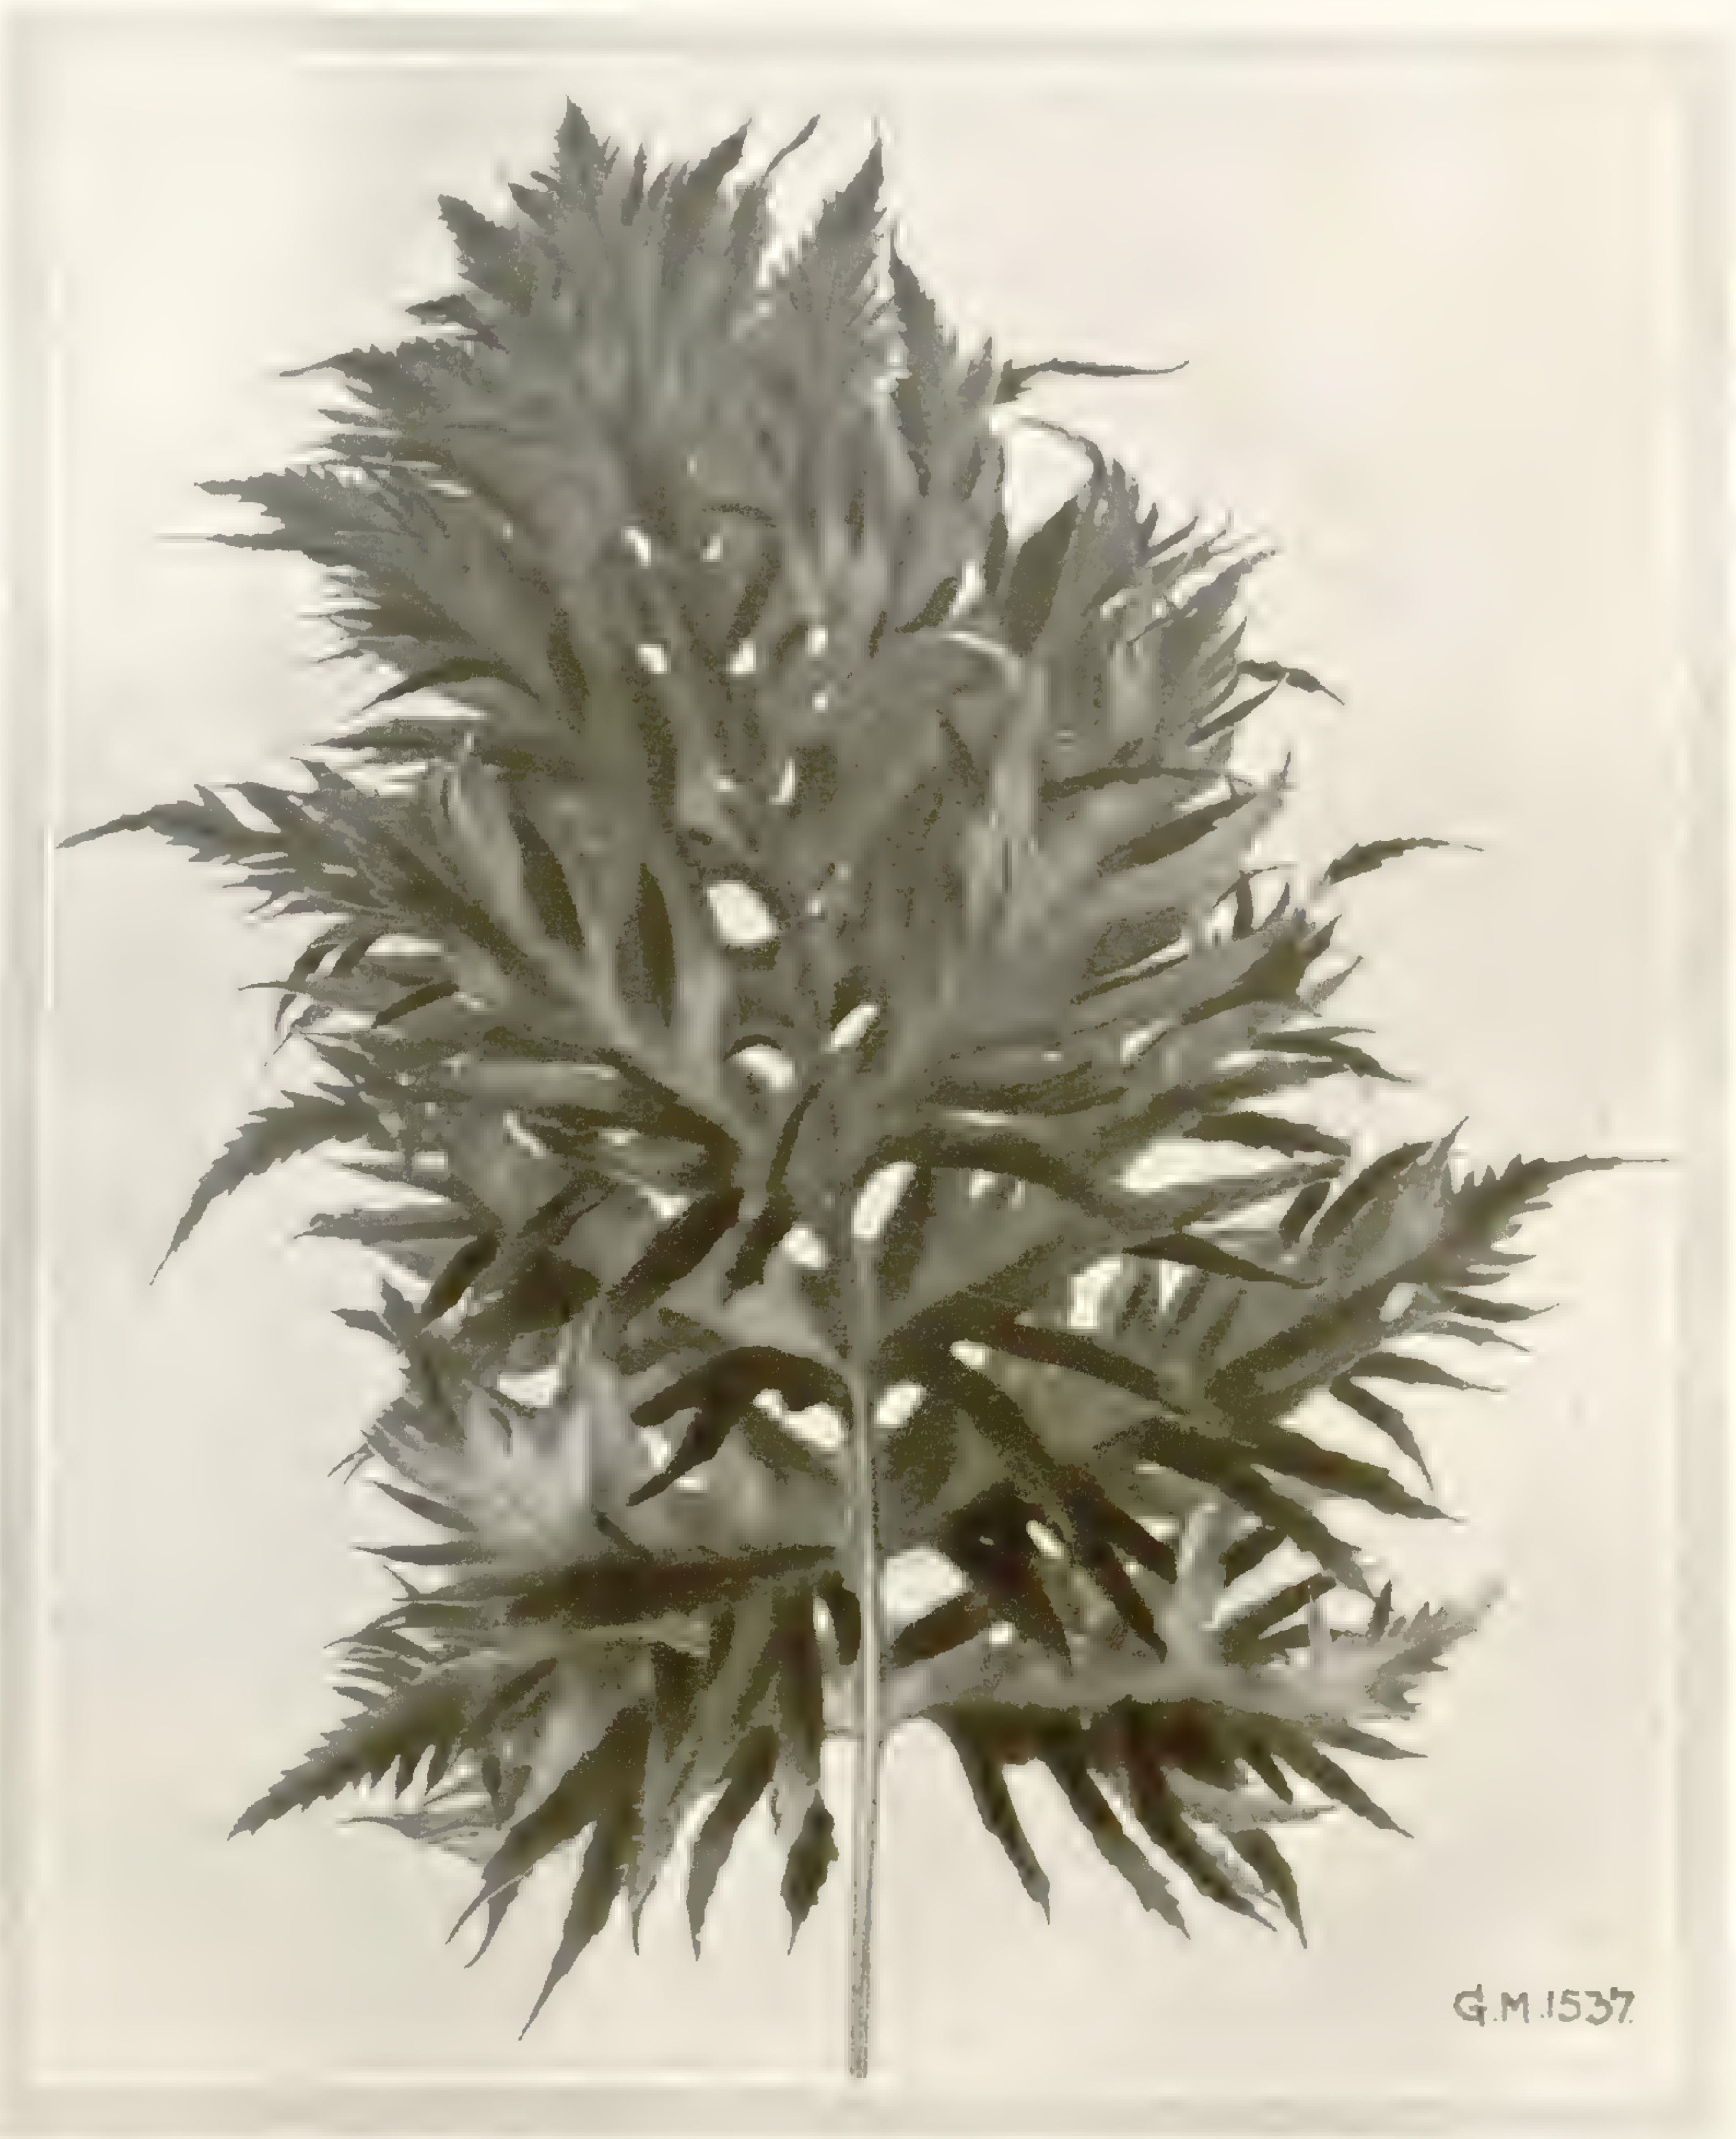
THE COMMON POLYPODY AS A DECORATIVE PLANT.

The Common Polypody (Polypodium vulgare) is well known to all country ramblers with an eye for pretty wayside plants, as a fern which fringes the tops of old walls with its once-divided fronds, nestles in the forks, and fringes the branches of old trees, especially of pollards, and peeps out in profusion from the hedge-tops or roadside banks, often for miles at a stretch in ferny counties where it is thoroughly at home. Examined more closely, it is found that these fronds spring from a creeping, fleshy root-stock as thick as one's little finger, and that these are anchored in open friable leafy soil in the hedgerows, in deposits of leaf-mould on the wall tops, and in the tree hollows, but also in many cases on wall sides and on tree branches, are firmly fixed in chinks in the former, and in mossy superficial growths in the latter; its size and development being in conformity with the root accommodation the situation provides, tiny, and stunted in the dry chink, and a couple of feet long in the frond in the hedgerow or pollard hollow. Normally, the frond is very simply constructed, a long bare stalk being continued as a midrib, whence on both sides springs a row of oblong bluntly-pointed sub-divisions with broad basis at point of attachment, so that they do not spring quite apart from each other, but jointly form a narrow wing each side the midrib in question, that is, as botanists term it, pinnatifid, or nearly pinnate, instead of pinnate or quite separate. Towards the top of the frond these divisions taper to form eventually a bluntish terminal.

In rambling about, however, it will be noted that this description does not always apply, and we come across specimens or even colonies where the blunt points become acute, and, instead of the regularly tapering tip we may find the fronds finish with a pinna set on end. In some parts, Wales and Ireland especially, the side divisions are frequently found to be widened and more or less divided again, and not infrequently in many other places the tips of most of the pinnæ divide into two or three (P. v. bifidum), indicating a capacity for producing tassels, which brings us to the decorative part of our article. All these minor variations indicate that the plant is by no means constant to one type, but they would hardly suggest the wonderful extent to which divergence has gone in numerous instances in this species. One form known as the Welsh Polypody (P. v. cambricum), because originally found wild in Wales, has been known for centuries. In this there is an utter transformation. The pinnæ are very long, wide, and overlapping, owing to their division into long-pointed segments, and so leafy in character that all resemblance to the normal is lost and a highly-decorative and beautiful plant is the result, the fronds being almost as wide as they are long, and growing very large.

During the last century some even more beautiful varieties on similar lines were found in the Lake District. P. v. c. Barrowi, with much more leafy fronds and longer and more acute divisions (vide illustration); P. v. c. Prestoni, of denser and more feathery make; P. v. c. Hadwini, of thinner texture and flatter, but otherwise closely akin, all three of which are ferny gems of the first water. The tendency to form tassels, shown in "bifidum," has found wonderfully increased expression in P. v. cristatum, with fine tassels at all tips; P. v. bifido-multifidum, with long, narrow fronds and tassels on blunt bifidum lines, but thorough; P. v. grandiceps Forster, Fox, and Parker, the first two with heavy bunch tassels, and the third practically with each frond one great branching tassel on an all but bare stalk.

In addition to the feathery or plumose cambricums above described, all of which are quite barren and papery in texture, we have P. v. pulcherrimum, with thrice-divided fronds, P. v. semilacerum and omnilacerum, with sharply pointed divided pinnæ on extremely ornate lines when they are thoroughly at home, which unhappily is rarely the case, and P. v. cornubiense or elegantissimum, which is a very eccentric variety, bearing fronds of three kinds, viz., normal, much-divided on coarsish lines, and much more divided on extremely fine lines. P. v. trichomanoides representing this last character with but little reversion to the others, as a selected improvement on the parent.



POLYPODIUM VULGARE CAMBRICUM BARROWI.

Many other varieties might be cited, but we are satisfied to recommend all these particularly as desirable plants for pan or suspended basket culture in cold conservatories, or in the open on rockwork under sheltered conditions. Grown in shallow, well-drained pans, stood on, but not in, saucers, in which water is always present, and provided with an open soil consisting mainly of leaf-mould, preferably oak, their travelling root-stocks spread over the surface, and produce a mass of the characteristic frondage such as no decorative foliage plant can excel. They are, of course, as native plants, quite immune from frost, and are so perfectly evergreen as to be particularly fitted for winter effect, the old fronds only dying late in the second season when the fresh set arises to replace them. In planting acquired specimens, the root-stocks should be kept on the surface and not buried, the attached fibrous roots being well spread out in the leafy compost beneath. Treated thus, all these will well repay culture, and cannot be too highly recommended.

Chas. T. Druery, V.M.H., F.L.S.

ACER CARPINIFOLIUM.

The Hornbeam-leaved Maple, Acer carpinifolium, is very different in appearance from the ordinary forms of acer, for the leaves resemble those of Carpinus betulus, the Hornbeam, more closely than those of the common maple, Acer campestre. It is a Japanese species, and was described many years ago by Siebold and Zuccarini. Travellers describe it as being a rather rare tree in Japanese forests, and it does not appear to be included among trees which are of commercial importance on account of their timber. Under cultivation it is of moderately quick growth, but the branches are slender, and it does not seem as if it would make very rapid progress in the girth of the trunk. The more or less ovate leaves are 4½ inches long and 2 inches wide, with deeply cut margins and a long drawn out apex. The upper surface is glabrous and the under-surface hairy, particularly on the nerves and in the axils of the veins. It thrives in rather light loamy soil, and is less subject to injury from late frosts than the palmatum group of the genus. Though it is doubtful whether any very large example is to be found in this country, nice, well-grown specimens are occasionally seen. It is one of Mr. Charles Maries' introductions, and was first grown by the Messrs. Veitch, of Chelsea.

W. D.

TOP-DRESSING FOR LAWNS.

With an increasing interest in tennis, croquet, and bowls, there is a correspondingly greater demand for lawns of healthy grasses, free from leguminous plants, daisies, and other obnoxious weeds, than was formerly the case; so that ground which had been poverty-stricken through the extraction of plant food from the soil during a long term of years, is being enriched and improved by various means.

In dealing with very poor ground, sickly grasses, and healthy weeds, the first step should be to clear out the latter by the use of some reliable preparation for this purpose: then set about feeding the grasses. In a wide experience I have seen many things employed with this object in view, and different results obtained on different soils. Light, sandy formations are the most difficult to deal with once they become poverty-stricken, and perhaps the best way of treating them is to lift the turf, heavily manure with well-decomposed farmyard dung, dig it in, re-level, solidify, and return the turf, giving a light dressing of slaked lime in February or March. During the growing season the ground should be mown twice a week, without the box on the machine. Under this treatment it is surprising what can be done in a single season to improve the herbage. If the mowings are allowed to remain on the ground for a few seasons, and an occasional application of lime given, a perfect lawn, so far as the growth of grasses is concerned, will be secured.

When it is outside the question to lift the turf and treat it in this way, owing to pressure of work in other quarters, I have found that much can be done to enrich the soil by top-dressing with horse droppings at the end of November and beginning of December. In order to break them up thoroughly they should be passed through a half-inch sieve and then evenly spread over the ground to a depth of not more than a quarter of an inch. In passing the droppings through the sieve all strawy matter is removed, and there is nothing to rake off in March when the ground is brushed and the lime applied. Brewers' grains mixed with the horse-droppings tend to invigorate the herbage, and on heavy soils a certain amount of sand added to the mixture will be advantageous.

The heavier soils are apt to become moss-grown when allowed to get into a barren condition, but this is easily removed by an application of ground sulphate of iron at the rate of 1½oz. to the square yard. Formerly gardeners were advised to pull the moss up with rakes and then surface dress with rich soil and grass seeds; but this method is crude, and, so far as raking went, often did more harm than good. In using the sulphate of iron we are not only killing the moss, which eventually decomposes and feeds the other herbage, but we are supplying a valuable grass food constituent, and securing a richer dark green colour. On both heavy and light soils frequent mowing without the box on the machine is a sure road to a grass lawn of unusual thickness and robust health.

For agricultural land leguminous plants are valuable in grass for feeding purposes, and phosphatic manures are specially suited to foster this class of herbage: but on no account should they be employed on lawns. Again, as iron acts inimically on the phosphates in the soil, it should not be used on agricultural land. For lawns, nitrogen, potash, lime, and iron are the plant foods to use to assist the growth of grasses, and these in accordance with the condition and chemical composition of the soils. No lime is required on calcareous mediums, nor iron where this exceeds 4 per cent. Few soils, however, are so rich in potash that an occasional dressing of potassic sulphate to lawns is not marked by a decided improvement in the vigour and appearance of the finer grasses. One and a half ounces to the square yard is the limit of the quantity to employ. Muriate of potash is sometimes used instead of the sulphate, but this contains more chlorine than is good for the plants. These chemical manures, however, may be regarded simply as auxiliaries once the soil contains a fair amount of organic matter, and good supplementary dressings of horse droppings or any other decomposing organic materials rich in nitrogen are given.

If anyone is fortunate enough to possess a tank containing the drainings from the farmyard manure heap, he has the essence of the very best materials for rejuvenating his turf. This, diluted and put on the lawn in December and again in January, and followed in March with 4oz. to the square yard of slaked lime, will induce the grass to grow apace. The strength and frequency of applications of liquid manure can be regulated in accordance with the needs of the herbage and the kind of turf required.

Hibernia.

FRUIT TREES AND SPRING FROSTS.

The following interesting paper was contributed to the Northern Counties Fruit Congress at Hexham, by Mr. S. T. Parkinson, B.Sc., of Wye College.

The problem of protection from spring frosts is a very old one. It has long been known that orchards suffer a very considerable amount of damage from frosts in the spring. Methods for minimising this have been tried from very early times. Perhaps one of the oldest is the well known method of lighting bonfires: this was even mentioned by Pliny about eighteen hundred and fifty years ago. He says: "The moon, however, is productive of no noxious effects at either of these periods, except when the nights are clear, and every movement of the air is lulled; for so long as clouds prevail, or the wind is blowing, the night dews never fall. And then, besides, there are certain remedies to counteract these noxious influences. When you have reason to fear these influences, make bonfires in the fields and vineyards of cuttings or heaps of chaff, or else of the weeds that have been rooted up: the smoke will act as a preservative."

It is curious how little the common idea has changed since his time. The moon is still regarded in many quarters as the cause of these frosts, though modern investigations lend no support to this view. This method of making bonfires has been developed by Lemstron in Finland, where early frosts do an enormous amount of harm to all crops.

Injury by frosts manifests itself in many ways, thus we may have discolouration and death of local parts of the softer parts of plants, as when the centres of strawberry flowers turn black and perish, or it may result in the formation of blisters, furrows, or clefts, which are generally to be observed in the hardy or woody portion.

The spring frosts that injure our fruit crops are often associated with the formation of ice in the plant. Where this takes place the soft tissues of the flower or unset fruit are generally damaged, and frequently destroyed.

The soft parts of plants are composed of plant cells, which consist of a cell wall, and contain the living substance or protoplasm of the plant. It may help us to get an idea of the structure if we think of a honeycomb the cells of which consist of a cell wall and contain honey. But whereas in the case of the honeycomb there are no spaces between the cells, this is not the case with the plant, for in the plant there are a number of spaces (known as intercellular spaces) which contain air, and water, and other vapour. The cell wall, although impenetrable for solid substances, allows sap and water vapours to pass through it.

It was formerly supposed that under the action of severe frosts the water inside the plant cells turned into ice. Ice, as we know, takes up more room than water, and it was supposed that as there was not room for the ice in the cell the wall burst, just as is the case with a water pipe when ice is formed in the winter. When the wall burst the protoplasm escaped and the well was destroyed.

If the cell is actually burst, as in the process described above, it is, of course, destroyed, and the injury irreparable.

But it was found that, at any rate, in some cases, where ice had actually formed in the leaf, it was possible to restore it to a normal condition by gradual thawing, and so the old theory was given up, and, as the result of observations, something like the following was said to take place when ice is formed. During a still night a considerable amount of heat passes out from the plant into the still air by radiation, also evaporation of moisture takes place, and, as a consequence, the water vapour present in the intercellular air spaces becomes chilled, and turned into ice. The changing of a relatively large amount of vapour into a small amount of ice leaves space for and otherwise causes the withdrawal of more vapour from the cell into the intercellular space. This, in its turn, changes into ice, so that two effects are noticeable.

Firstly, ice in the intercellular space is gradually accumulating; secondly, water is being continually withdrawn from the cell wall and from the protoplasm inside the cell to form more ice in the intercellular space.

If much ice is formed it will force the cells apart from one another, and so make a rent inside the tissues of the plant, but, as a rule, will not burst the cell wall.

Now if this is what happens, we can see that on gradual thawing of the ice the water might be restored to the cell and the life of the cell still continue. If, however, the thaw is very rapid, the water formed from the melted ice will evaporate into the air, and be lost before it can get back into the cell.

So that it was supposed a certain amount of water may be withdrawn from the cell and restored again without destroying it. But more than this may happen, for if the frost was very severe, or of long duration, so much water would be withdrawn from the cell that it would be actually taken from the protoplasm itself, and in such a way as to cause the protoplasm (that is the living matter) to be changed beyond possibility of restoration. And seeds heated in a glass tube will perhaps help to illustrate what is meant here. If, for example, dry wheat seeds are so heated it will be found that water is given off from them and condenses on the sides of the tube, but the vitality of the seed will be gone because the protoplasm has been destroyed. From these considerations it appears that the deadly effect of the frost is not due to mere cold, but to a drying-up process which, when carried to excess, causes both mechanical and chemical changes to occur in the protoplasm of the cell.

The same degree of frost may perhaps, in the case of the same plant, be at one time harmless and at another deadly, according as the thawing is (1) gradual or (2) sudden, and, providing the freezing has not gone too far. But this point is much disputed. Sarauer draws attention to the fact that if you touch a frozen leaf with the warm fingers the part so touched will be destroyed, whereas the rest of the tissue may recover. Practically this would mean that it is not the frost but the quick thaw which is dangerous. Certainly this is not universally true.

(To be continued.)

BY APPOINTMENT. BY APPOINTMENT.

CHEAP OFFER TO CLEAR.

We beg to inform our numerous clients that we have secured a large tract of land adjoining one of our principal Nurseries, and that it is our intention to clear the Stocks off some of our outlying branch Nurseries at a sacrifice.

Everything has been grown with our usual care, and offered in Lots, subject to being unsold; we guarantee the numbers and quality of each Lot offered.

Particulars of above, together with our General Catalogue, will be sent on application.

JAMES SMITH & SONS (Nurserymen to H.M. THE KING), **DARLEY DALE NURSERIES, near MATLOCK.**

Inspection cordially invited. Visitors met by appointment at Darley Dale or Matlock Stations.

GOLD MEDAL ROSES

WILLIAM LOWE'S

BEESTON ROSES

ARE THE BEST.

For all Soils and Situations.
Roses for Exhibition.
Roses for Pergolas.
Standard and Bush Roses.
Roses for Garden Decoration.
Pillar Roses. Climbing Roses for Walls.
Old and New and all the Best Roses.

All are magnificent plants, and the best value for money obtainable.

Also a grand lot of

FRUIT TREES, ORNAMENTAL TREES, SHRUBS, etc.

Intending Planters should come and inspect my stock of HOLLIES and EVERGREEN SHRUBS of all descriptions.

30 Minutes' walk from Beeston Station.
Send for Catalogue, Post Free on Application.

WILLIAM LOWE,
Nurseryman and Rose Grower,
BEESTON, NOTTS.

ALL SWEET PEAS ENTHUSIASTS

SHOULD GROW MAORI BELLE, New Zealand's Premier Sweet Pea; purest Lavender yet offered; 40 per cent. fours; 10 seeds 1s. Cole's LORD ALTHORP, a refined and incomparable bloom with Earl Spencer-orange standard, orange-carmine wings WITHOUT THE GLARY CRIMSON of latter day favourites, 8 seeds 1s. Cole's MRS. W. S. BIRCH, a giant, but refined mauve-pink on yellow ground, A PERFECT NOVELTY, 10 seeds 1s. Cole's EARL SPENCER, without doubt the deepest orange self Sweet Pea on the market, 10 feet high in our trials, 9 seeds 1s.; 4 seeds 6d. List ready November-December—cannot get particulars before—*it will again be* [illegible] Every S. Pea of merit will be stocked.

ABOVE ARE ALL SPENCERS.

G. H. MACKERETH,
The Sweet Pea Clearing House,
ULVERSTON.

Orchids! Orchids!! Orchids!!!

The undersigned begs to announce to the Public that he is in a position to supply, whole ale or retail, **Burma Orchids** of 50 varieties at a moderate price. Further particulars on application.—**J. C. PRAZER, Orchid Collector, KALEWA, BURMA.**

Bulbs: NARCISSUS, DAFFODILS, TULIPS, &c.

All Good Flowering Bulbs; Worth Double.

NARCISSUS AND DAFFODILS, 5/-, 7/6, 10/- per 1,000
TULIPS ... ... 10/-, 15/-, 20/- per 1,000

Many other varieties to offer; also all kinds of Herbaceous plants. Any of the above, half quantities at half price.

FRUIT TREES.—Apples, Pears, and Plums, all fruiting trees, **9/-** per dozen. Gooseberries, Currants (black, red, white), **3/-** per dozen. Loganberries and Raspberry-Strawberry, **5d.** each. Raspberry Canes, **3/-**, **4/-** per 100. Strawberry Plants, **1/-** per 100.

All kinds of Flower & Garden Seeds, also ***POTATOES.*** *Send for List,*

J. W. CROSS, Old Grammar School, **WISBECH.**

A SPECIALITY FOR MORE THAN 50 YEARS.

POT VINES

Strong well-ripened Canes, clean and healthy, for planting and fruiting. Descriptive List FREE.
ALSO FIGS AND PEACHES.

J. R. PEARSON & SONS, LOWDHAM, Notts.

NEW ROSE
CRIMSON RED DOROTHY PERKINS
"Excelsa"
(Award of Merit, R.H.S.)

Planters of Roses should not omit this fine variety this season. Price **3/9** each, **42/-** doz.

We have also good plants of **"Juliet," "Duchess of Wellington,"** and other fine sorts.

STUART LOW & CO.,
Fruit and Rose Growers,
BUSH HILL PARK, MIDDLESEX.

HERBACEOUS BORDERS

Original Schemes designed by our Border Expert. Choice mixed Borders. Colour Schemes. Borders flowering through the Season from Spring until Winter. Borders to flower over a given period. Existing Borders renovated or remodelled. Advice freely given. Terms strictly moderate. Plans and Estimates submitted.

ROCK GARDENS

Estimates given for Constructing Rockeries, Furnishing Plants. All kinds of Natural stone supplied to any Station. Clients interviewed in all parts of the Kingdom by appointment. No enquiry too large or too small to gain our prompt attention.

ROSES, FRUIT TREES

Roses—Hybrid Perpetual, Hybrid Teas, Standards, Dwarfs, Climbers, Ramblers in great variety.
Fruit Trees—Standards, Pyramids, Dwarf Trained up-to-date sorts. All clean, well grown and sturdy.
Hardy Evergreen Trees and Shrubs, Climbers and other Plants for Greenhouse, etc.
Delphiniums, choice varieties, 6/- to 18/- doz.
Phloxes, superb colours, 6/- to 9/- doz.
Pæonies grand selection, from **10/6** doz.
Tree and Border Carnations, great variety, from **5/-** doz.

CARNATIONS, PINKS, AURICULAS, DAFFODILS
(4 Gold Medals R.H.S.)

12 choicest Carnations and Picotees for borders, **6s.** to **12s.** per doz.; **12s.** to **21s.** per doz. pairs. Choicest Malmaisons, **7s. 6d.** per doz. Pinks, the sweetest and best, **5s.** per doz.; 1 doz. pairs, **9s.** Best named Alpine Auriculas, from **9s.** per doz. Edged Auriculas, from **21s.** per doz. All established in pots for safe removal.

Auricula, Polyanthus, and Pink Seed, **1s. 6d.** to **2s. 6d.** per packet.

Illustrated Catalogue Free.

J. DOUGLAS,
GREAT BOOKHAM, LEATHERHEAD.

ORCHIDS. ORCHIDS.
Clean, healthy, well-grown Plants at reasonable prices.
Many large specimens and rare varieties.
STOVE AND GREENHOUSE PLANTS OF ALL KINDS.
Please Write for List.
JAMES CYPHER & SONS,
Exotic Nursery, Cheltenham.

CHESTER NURSERIES.
Over 500 Acres in extent.
LARGEST STOCKS OF

Forest and **Ornamental Trees, Evergreen,** and Deciduous Flowering **Shrubs, Covert,** and **Hedge Plants, Rhododendrons, Hollies, Yews,** and **Aucubas.**

Fruit Trees, Vines, Figs, and **Orchard House Trees,** established in pots.

Roses, Bushes, Standards, and in pots. **Herbaceous Alpine Plants** and **Aquatics. Greenhouse** and **Stove Plants, Hardy Climbers, Asparagus, and Seakale,** strong and extra strong for forcing.

LANDSCAPE GARDENING.—Planting by contract or otherwise a **speciality.**

New Illustrated Catalogues.
Special Quotations & Samples free on application.

DICKSONS **Nurseries, CHESTER.**

New Late-Fruiting Raspberry,
DANN'S MONARCH.
AWARD OF MERIT at the Eastbourne Horticultural Society's Show, Nov. 2nd, 1910.

This is without doubt the finest Autumn Fruiting Raspberry ever sent out, being a dessert berry of splendid flavour and very large, almost as large as the strawberry. It is an enormous cropper and very hardy. It commences to ripen in August and continues in fruit, if the weather is mild, until December in the open. 115lbs. of fine berries were picked from my canes the last week in October this year.

Well-rooted Planting Canes, 15/- per doz.; **£5** per 100
Free on rail. Cash with order.

FROM **A. E. DANN,**
Fruit Grower,
Oaklands, HAILSHAM, Sussex.
Please mention "Gardeners' Magazine" when ordering.

Catalogues and Estimates Free.

MOON DAISIES.

I have been interested in the remarks of your correspondent "Alger Petts" concerning the Moon Daisies (Chrysanthemum maximum varieties) in the issue of October 22, and while being desirous of extending the list of forms given, I have no wish to go over the ground he has covered. A reference to the Shasta daisies reminds me greatly of their introduction some years ago, when a trial of several hundred of these Shasta daisies of Burbank's came under my notice. Of all these seedlings I do not remember noting any worthy of naming and perpetuating. True, there was great diversity of form and habit, and some varieties carried several rows of petals, giving them a semi-double character, but apart from their lightness and service for decorative purposes, there was little to commend them over the existing forms of Chrysanthemum maximum.

Then again the introduction of the much lauded "cream" and "primrose" coloured varieties, California and its associates, was to have heralded the dawn of new colourings. Yet under trial these forms giving creamy-hued buds, opened to reveal greyish white petals which were certainly not nearly so pleasing as the pure white-petalled varieties. Robinsoni, doubtless the same as Mr. Pett's William Robinson, is a pretty laciniated flower, though it is recorded that the newer Kenneth is an improvement upon that well-known form. Mrs. C. Lowthian Bell has again this season proved its true merits. It is dwarf with stout stems, huge blossoms, and is continuous in blossom. It is one of the first to bloom amongst the large-flowered class, and at the moment of writing (October 21) the plants still carry many blossoms. King Edward is always attractive, and its bold habit, and hosts of fine flowers make a fine picture in the larger herbaceous borders. Li Hung Chang has failed by reason of its unfortunate habit of hanging its head, but those sterling new forms, The Speaker and Progress, are notable by reason of the fine grand-petalled flowers they produce.

The new Dutch variety, J. Tersteeg, should prove an acquisition. It combines a tall, grand habit with large snowy blossoms, borne upon stout stems. Other excellent forms include the older Moonlight, which is even yet a favourite in many gardens. Rev. Arthur Carter, a medium-growing variety, giving a profusion of fair-sized blossoms, and James Cocker, a fine free-blooming form, with large rounded flowers borne upon stout stems, are good.

The combinations in floral display in which the Moon Daisies take a conspicuous part are many and varied. Two of the best are colour combinations of white and blue, and white and gold. With the white masses of the moon daisies one can group some of the prettier of the tall campanulas, or the blue of Scabiosa caucasica, which for duration of blossoms even exceeds the best of the daisies. For the gold combination there is a wealth of golden border perennials, such as heleniums, anthemis, etc., etc., which readily provide the means of attaining the desired effect.

P. S. Hayward.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, staging, etc. Price 1s. net, by post 1s. 2d.; cloth 1s. 6d., by post 1s. 8d. from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NEW PLANTS, ETC.

◆

SOPHRO-CATTLEYA DORIS COBB'S VARIETY.

This is one of the finest of the Sophro-cattleyas, the dwarf plant carrying a handsome rounded flower of good size, and of particularly brilliant orange-scarlet colouring, with some yellow markings on the lip. The parents are Cattleya Dowiana and Sophronitis grandiflora. F.C.C., R.H.S., Nov. 8; W. Cobb, Esq. (gardener, Mr. C. J. Salter), Normanhurst, Rusper, Horsham.

CALANTHE COOKSONIÆ GIGANTEA.

A very fine white calanthe, broad lipped and resembling C. Harrisi. It is the result of crossing C. vestita rubro-oculata with C. Harrisi. A.M., R.H.S., Nov. 8; Mrs. N. Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne.

LÆLIO-CATTLEYA OLIVIA.

A beautiful hybrid between Lælia Jongheana and Cattleya Schroderæ. The plant is of comparatively dwarf habit, and carried one flower of good size. The sepals and petals are a lovely shade of blush pink, with deeper shading, while the waved lip is orange-yellow, with a rosy edging. A.M., R.H.S., Nov. 8; Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

CARNATION MRS. C. W. WARD.

A new perpetual-flowering variety with rather large flowers of rich rose-red colour. A.M., R.H.S., Nov. 8; Mr. C. Lange, Hampton.

CHRYSANTHEMUMS.

Mrs. Frank Hill.—A large single variety with soft mauve-pink flowers, a pale, almost white band, encircling the eye. A.M., R.H.S., Nov. 8; Messrs. G. Williams and Sons, Cardiff.

Victorian.—A very beautiful and refined exhibition Japanese variety. The ground colour is deep dull yellow, and this is heavily overlaid with rich red. A.M., R.H.S., Nov. 8; Messrs. J. Stredwick and Son, St. Leonards.

APPLE ARD CAIRN RUSSET.

We have received examples of this apple from the Messrs. Hartland—our readers will remember there were no examples left after the committee had satisfied itself as to the merits of the variety. The fruits are of medium size, broad based, conical, and slightly ribbed. The colour is yellow, with red flush and streaks on the sunny side, and plentiful patches of russet, the latter almost covering the shaded side. The stalk is short, rather deeply inserted; the eye is prominent, closed, and set at the apex of the fruit in a very shallow and puckered depression. The flesh is crisp and highly flavoured, and altogether the apple is a very promising one as a late dessert variety. We understand that the variety has been growing at Ard Cairn for upwards of a hundred years. A.M., R.H.S., Nov. 8; Mesrs. W. Baylor Hartland and Sons, Ard Cairn, Cork.

APPLE ARD CAIRN RUSSET.
A dessert variety of good flavour; skin yellow, red, and russet. A.M., R.H.S., Nov. 8; Messrs. W. Baylor Hartland and Sons, Ard Cairn, Cork.

POPULUS LASIOCARPA.

This remarkable poplar was given a first-class certificate by the Royal Horticultural Society on September 15, 1908, which is at once a strong recommendation for it, and a mark of appreciation of its evident great horticultural worth from a large number of our leading horticulturists. It was originally discovered by Dr. A. Henry, in the province of Hupeh, in mountainous districts, at elevations varying between 4,000 and 6,000 feet. As a wild specimen it has been recorded as forming a tree from 20 to 40 feet high; under cultivation it grows vigorously, but it remains to be seen as to what dimensions it is likely to attain. Its ornamental character centres in the foliage, for the leaves are larger than those of any other poplar. They are ovate or cordate in shape, and frequently from 10 to 12 inches long and 8 or 9 inches wide. The colour is dark green and there is a deep red midrib which adds to the general effect. On the under-surface, the veins are clothed with velvety hairs. The species is one of Messrs. Veitchs' introductions, and is likely to become a popular tree for decorative planting.

W. D.

FORCING PITS AND HOUSES.

Practice of many years duration, and science as applied in present day forcing houses, are great helps to the gardener who must of necessity have supplies of either fruit, vegetables, or flowers out of their natural season. It is quite true that properly built and efficiently heated structures must be so placed that the maximum light can be made use of at the dullest period of the year. Shelter, also, from the prevailing cold winds in any given district must be thought of, and means provided for tempering their violence. Those who have not had to do with the planning and necessary arrangements connected with forcing houses have now many opportunities of studying existing ones in their neighbours' gardens; and the good firms of horticultural builders who frequently advertise in these pages are ever ready to advise those who might benefit by their services. At the same time those about to build should have a fairly clear idea of what is wanted to meet their special case.

Horticultural buildings, like those for other uses, may cost almost as much to erect as the owner may care to lavish upon them, but what we may term the utility types of houses, so frequently erected for the market growers, give general satisfaction to those who of necessity must use all the available interior space for the crops to be produced. Present day forcing pits and houses, too, are much lighter in build than structures of former days; heavy beams and deep sash-bars have given place to lighter materials without in any way weakening the structures. It would appear, from studying the erections of bygone days, that the more wood and panes of glass that could be crowded into the building the more serviceable it would be, happily for us it has been proved that wall-plates, sills, bars, etc., of lighter, well-seasoned wood last longer than the heavy timber formerly employed.

A very important point in connection with the building of forcing houses is to see that there are no flat, or nearly so, surfaces of wood where condensed or other moisture can lodge. Wall plates should be sufficiently sloping for any moisture to run quickly away, and if the timber used is properly seasoned, and all moisture kept out by using good paint whenever necessary, the structures will stand for many years. The particular design to be employed is sometimes governed by existing erections, and should a wall already exist that is facing the sunniest quarter, a three-quarter span structure would give excellent results with such crops as early beans, melons, cucumbers, tomatoes, and cut flowers that are usually obtained from bulbs or deciduous flowering trees and shrubs.

It is often a great advantage, especially in windy districts, to excavate rather freely for forcing pits and houses, and, providing drainage is good, and that the additional depth can be safely provided for in the matter of boiler accommodation, the interior can be kept at a more uniform warmth. Sunk houses are also convenient for outside covering during very severe weather, and the occupants may be more healthily grown thus than is the case when pipes are over-heated to maintain a given temperature. One of the chief necessities where forcing is done is the use of plenty of hot-water pipes for maintaining a good bottom heat in addition to that required for the general interior. Front lights are hardly an advantage for very early forcing as the necessary airing may be arranged for by having a few box ventilators opposite the hot-water pipes, and, of course, making ample provision in the roof for regulating the temperature caused by sun-heat. Houses about 12ft. wide, whether span-roofed or three-quarter span, are a very useful size for growing such crops as I have named, and those of a similar nature. For beans, strawberries, and the raising of numerous seedlings, front lights are an advantage, but for forming beds of manurial warmth, in addition to the hot-water pipes, for growing such crops as melons and cucumbers, whose roots are in the soil, there is no advantage in having their roots unduly dried by front sunshine.

The old forcing type of pit is already giving place to something where less straw manure is required for keeping it at a pleasant temperature, and in some cases heated pipes are being laid in the soil for producing bottom heat. The warmth given off is not of that mild ammoniacal nature that is so helpful to plant life, and careful management is required to judge of the amount of water necessary for the growing crop. Forcing pits are great aids in any garden, and, providing plenty of long manure and leaves are to be had, the brickwork may be built a yard below ground, and the soil inside thrown out to that depth, the space left being ample for good bottom heat, and the two pipes arranged along the front of the pit will keep up a good forcing heat. There is no advantage in having too much brickwork above ground; 18in. at the front, 2ft. 6in. at the back, will be a useful and convenient height for a frame from 6ft. to 8ft. wide—generally 6ft. in width is most convenient for giving attention to the crops; movable lights ought not to be more than 4ft. or 4ft. 6in. wide, and should be provided with handles at the top and bottom. In windy places the runners should be provided with buttons to prevent the wind lifting them.

Span-brick pits are also very useful and ought not to be less than 8ft. wide, with about 1ft. of 4in. brickwork above ground, or, preferably, a concrete wall; one row of 4in. piping running all around the frame will keep up a steady warmth. For early crops requiring more air and less atmospheric moisture during the dull season of the year they are excellent, as well as for growing sturdy shapely plants for flowering purposes. Useful forcing pits may also be formed by placing the portable span frames with hinged lights on prepared brick or concrete foundations, heating them in the same manner as brick pits. All span frames will need centre supports. Gas piping set on a brick foundation will be light yet strong enough to support the weight. The amount of piping required for a forcing house 12ft. wide will be at least four rows on either side of the path under each bed, provision being made for the heat to escape into the centre of the house and up near the outer walls. In addition I should prefer one 4in. pipe for additional top warmth in all houses with glass fronts; the extra cost in the first instance is more than compensated for by the saving in fuel.

Ventilating is now well provided for, and if the houses are of great length lever workings will save much time. Ventilation need not be continuous in forcing structures, but be fixed between every three panes, so that each ventilator has two bars or three panes of glass in it. It is important that each ventilator fits closely on to its seat, or wind and rain may enter, and effectual vapourising for pests would be made difficult.

Of all materials employed for placing over the heated pipes for forming the forcing beds, thick slates are most satisfactory, they harbour no woodlice and are easily cleaned after each crop has been removed. If a span-forcing house is built in an isolated position very useful frames may be built on both sides of it, 4ft. 6in. wide being a good width to have them; a good deal of warmth will come through the wall into the frame and a couple of 2in. pipes along the front will keep up a useful heat for many things. There are scarcely any other features in a garden that call for greater skill than that connected with forcing; it is therefore very necessary that the grower should be able to control the warmth by proper screw-down valves to all the flow pipes, and it may sometimes happen that it is necessary to have them also on the returns, but these are matters that are largely governed by the general scheme of structures and the position of the mains from which pipes are taken for heating the various types of houses. As warmth and moisture are a necessity in forcing houses the interior should not be so highly finished that there are practically no moisture holding surfaces about the floors and pipes, otherwise red spider and thrips will be difficult to keep down.

CHARLES FOSTER.

Sutton Green.

FRUIT TREES FOR LOW WALLS.

If we accept the axiom that all wall space is valuable, it follows that even very low walls should be used to the best advantage. When only some three feet six or four feet in height walls are often regarded as of little if any use for fruit, and either they are left bare or anything is allowed to run over them which will cover them up quickly and completely, sometimes ivy or the ubiquitous ampelopsis. If there is a flower border in front of such a wall the difficulty of devoting it to fruit is increased, especially if the border is used for perennials, for it might mean that the trees would be almost concealed during the summer months, when they would soon become weak, or make badly-balanced growth, in which all the new growth would be above the wall. I know it is rank heresy to talk of having flowers on a fruit tree border, and, of course, there must be some sacrifice of flowers in such a case—a compromise, in fact. If it is a wide border, and the trees are given a clear space of three feet at least from the stem, a very workable compromise will be effected, either by restricting the use of the border to plants of medium height, or by bringing some of the tallest plants nearer to the front, and putting low-growing things in the bays so formed, and in the spaces at the back, thus reversing the usual practice of planting a mixed border, and, in some ways, rather improving upon it, always assuming that the low-growing things behind the tall ones flower before the latter hide them. But we will assume that our wall is suitable for training fruit trees upon in every respect, but is low.

In the first place, it may be said without fear of contradiction that for such a wall fan-trained trees, other than those of bush fruits, are quite unsuitable. In a fan-trained tree there is always a strong tendency for the growth to be strongest on the central branches, and that is just where there is least room for extension, as these branches are probably at the top of the wall the first summer after planting, and the necessary shortening produces the inevitable result, while there is a limit to the amount of restriction that can be practised consistently with the health of the tree. As regards bush fruits, one hardly likes to give up any but a north or east wall to them, and on such an aspect, even if the wall is only three or four feet in height, gooseberries may be grown with great success, the wall being covered from top to bottom, as the lowest branches of a fan-trained gooseberry often grow as strongly as the middle ones. Red or white currants can also be grown with greater or less success on the same wall, but are more inclined to make strong growth at the top at the expense of the lower branches.

The horizontal-trained tree, or what is generally known as the espalier form, is suitable for such walls, as the extension of the tree is in a horizontal direction only, supposing the tree to be furnished with the requisite number of tiers at the time of purchase. The double horizontal cordon is the simplest form of this kind of tree, consisting of one tier only. This espalier form of tree requires more than usual care in pruning—and all wall trees require a good deal—if a fruitful and well-balanced growth is to be maintained. This is the ideal form for a wall-trained pear tree, and also for the apple, though a wall is not often given to it, but for stone fruit it is not generally considered a success, the branches resenting being bent down to the horizontal position, and often die off altogether if trained in the same horizontal plane as the point of junction with the central stem, or at right angles to the central stem. One large firm of nurserymen specially recommends plums as horizontal trained trees, and if such are tried this latter danger must always be borne in mind, or branches will be lost, and when lost can never be replaced. At least, that is my experience, though I hear some speak lightly of replacing branches by inserting buds in the leader.

Having considered the objections to the fan-trained tree, and the limitations of the horizontal-trained tree, we need not consider the different variations, known as gridiron trained, toasting fork, and the like, as they are obviously more unsuitable than the two we have discussed. But there remains to be considered the single cordon form, and this is undoubtedly, for fruit trees in general, the most suitable form of tree for a low wall. Such trees, when growing in the nursery, will be in the form of single upright cordons, but when they are planted against a low wall they can be put at an angle of 45 degrees, or even less angle, at two to two and a-half feet apart. As they lengthen, and get to the top of the wall, they can be depressed, and so have room to grow longer. Though when grown as upright cordons a foot and a-half is space enough to allow between them, yet it must be borne in mind that when planted at an angle of 45 degrees, and still further depressed as they lengthen, they come close together, so that two feet apart is not at all too much space, but rather too little, to allow them, two and a-half feet being better when the wall is very low.

Some of the cordons will probably need to be taken up and root pruned before they will come into bearing, and this is best done late in October or early in November of the first year after planting, in the case of any which show unmistakable signs of rampant growth, but is better delayed till the same period of the second year in the case of normally strong growers, the poor growers, of which there will probably be few, being left alone altogether, as far as may be, though taking up the trees on either side will probably check them to some extent. By this means all the trees, if the varieties have been judiciously chosen, will be in good fruiting condition the third year after planting—many before this—by which time they will have attained their full length, and then with fairly good fortune, especially if some little protection is given from frost, fruiting should be sufficiently regular to obviate the necessity for further root pruning, except in the case of one or two incorrigibles. If a tree dies and has to be replaced it must be given a good start to enable it to hold its own against its well-established neighbours, and to this end it is advisable to put a piece of tile or slate between it and them to keep their vigorous roots away from the good fresh soil put in for the new tree, as it will be equally to the advantage of the new tree to have the good soil to itself, and to the old ones to be kept out of it for a year or two.

I know a long low wall not more than three feet and a-half high which is well covered in this way, the available space being increased by a simple device. Iron bars were fixed to the wall so that they stood up above the top of the wall some two feet. The bars were twisted in the middle so that the vertical plane of the part above the wall was at right angles to that of the lower part, and holes were punched in the upper half at regular intervals, wires being passed through the holes and tightened at the ends of the wall. This increased the possible length of the cordons by several feet, and by giving them this additional run the need for root pruning was lessened.

Both the selection of sorts and the preparation of the ground need more than ordinary care, or more than many people give to them. As regards the former, it is a bad plan to go to an exhibition and choose those varieties which most take the eye. There will probably be some failures even with the most careful selection, but to adopt this method will be to ensure a good many, as nothing is more deceptive than the exhibition table for this purpose. Some varieties, too, are not adapted to this method of cultivation, however well they may do in other forms. It is better to make out a list of the varieties one fancies, and ask some trustworthy nurseryman or experienced private grower, or both, if there are any in the list he does not recommend for the purpose.

As to the preparation of the border it is needless to point out what a drain upon the soil this method involves. It does not matter much about the nitrogen content as a rule, until the trees have borne some heavy crops, but the stores of lime, phosphate, and potash tend to become seriously depleted after a few years, so that a good reserve should be put in before planting. Lasting manures, such as bonemeal, basic slag, and kainit should be well mixed with the soil, while the sifted ashes from the garden fire are above everything as a medium for working in amongst the root fibres when planting the trees, as they root more quickly in these than anything else.

Alger Petts.

Bougainvillea glabra Out-of-Doors.—There is a widespread idea that this bougainvillea requires a good deal of heat, for its successful culture, but this is by no means the case; indeed, it will flower well out of doors during the summer months. In this way, with full exposure to air and sunshine, the bracts are more highly coloured than when they develop under glass. Good-sized examples may often be seen bedded out in the London parks. Being a native of Brazil, it, of course, requires to be kept quite safe from frost in the winter. Some forms are superior to others, the best coloured, as well as the hardiest, being Sanderiana.—W. T.

HEAT FOR PERPETUAL CARNATIONS.

The use of artificial heat for carnations is a perplexing matter to many. The crux of the whole matter is more one of light than heat, or at least graduated heat in accordance with the light. That is why all good growers advocate a day temperature ten degrees higher than the night temperature.

On a bright sunny day your carnation house will register 70 or 80 degrees, but with a circulation of air on the house this will do no harm, simply because you have an increased light. Large market growers build light, airy houses on this very account, while in America they are able to run their carnations at a much higher temperature during the winter than it is safe to do over here, because they have a stronger light in winter. This is also increased by the sun's rays being reflected by the snow.

One of the fundamental principles in carnation growing is to avoid a sudden drop in the temperature. This is what the perpetual carnation most abhors. An even day and night temperature must be maintained.

We will take, for example, a bright day at the present season of the year. The sun sets at about 4.30 p.m. The ventilators will require lowering in accordance with the drop in the outside temperature from two to four o'clock (p.m.), at which time on ordinary days the ventilation would be reduced, and mild artificial heat commenced, because the sun's influence lessens rapidly as its rays begin to leave the glass. The heat inside is increased as the outside heat fails, but instead of maintaining the regular day temperature you allow it to fall gradually to the required night temperature.

It is a mistaken idea that the low night temperature is to counteract the higher day temperature, it is simply providing a degree of warmth in which the plants can produce a healthy strong growth. Heat and light go hand in hand, and as it is practically impossible to control the light, we have to confine ourselves to the heat.

Naturally the question arises: What is the best temperature for day and night at which to grow perpetual flowering carnations? Now I should say, under normal conditions, that is, with a good light house, well equipped with ventilators, a night temperature of between 45 and 50 degrees, and a day temperature between 55 and 60 degrees, and if these degrees of warmth are maintained with as much regularity as possible three parts of the way to success is covered. Yet it would be folly for anyone growing perpetual carnations in an old-fashioned house with heavy rafters, or a poor aspect, to try to grow them with the same temperature as under more favourable conditions. The light is weaker, so the temperature must be less, say 40 to 45 degrees at night, and 50 to 55 degrees during bright days. It is that power to adapt oneself to circumstances which is so essential to good culture.

In the matter of ventilation we have one of the most difficult subjects to write about, simply because we can never lay down definite rules, but have to be guided by circumstances.

In the case of perpetual carnations, as much air as possible should be given during the night and day, retaining the previously mentioned temperatures, and avoiding all draughts. On a clear night, to have a moderate supply of artificial heat, and at the same time a fair amount of ventilation, will promote ideal conditions for Dame Carnation, giving that amount of buoyancy and freshness in the air which contributes to a free, healthy growth.

Montagu C. Allwood.

Bush Hill Park.

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

SOME PECULIARITIES OF ROSES.

It is little wonder few writers upon, or even growers of, roses, agree respecting the growth or some other characteristic of several varieties; and how seldom they select the same half-a-dozen as most suitable for a given purpose, when we consider how differently they behave in certain localities. A rose does well with one, or else it happens to be his or her favourite colour or perfume, and so it is lauded by that grower. Even when the soil and conditions are apparently closely allied, we often find great divergence of growth and results.

Some stand by plants upon their own roots alone, others must have some special stock. The crux of the matter is, we should go a great deal more by the results in our own case, and not lay down too fast a rule for all others. Whatever one may say there is little doubt that some varieties do thrive as well, if not better, upon their own roots than upon any stock. And it is also unquestionable that many are greatly aided by the use of foster roots. But these should be suited to the variety of rose and the soil they are growing in. The fact is, we have such a vast number of roses and hybrids that it is hopeless to expect all to do under precisely the same conditions. We might almost as well expect the same with orchids. So that we need not condemn a variety as weak-growing simply because it does not show any disposition to vigour with ourselves. I have seen many instances of this, and it has been difficult to credit a certain variety as growing so strongly as some assert until the plants have been seen and the correctness of the name verified.

Then there is the peculiarity of stocks and hardiness, which vary so much in the same locality. I have had some splendid plants of Comtesse de Nadaillac in a sheltered position, but, as a rule, it has been very weakly in the open; yet a neighbour grows it most rampantly in, to all appearances, the same soil and position as my own fail. Horace Vernet I have seen almost as strong as I have Ulrich Brunner, but one will generally find it described as an indifferent grower, and it is so with me.

Sports again are peculiar, often going back to the original, and generally varying very much even among themselves and upon the same plant. We obtain a hybrid between two varieties that partakes of both parents in a more or less degree, and others from the same pedigree that one wonders if the cross was correctly stated.

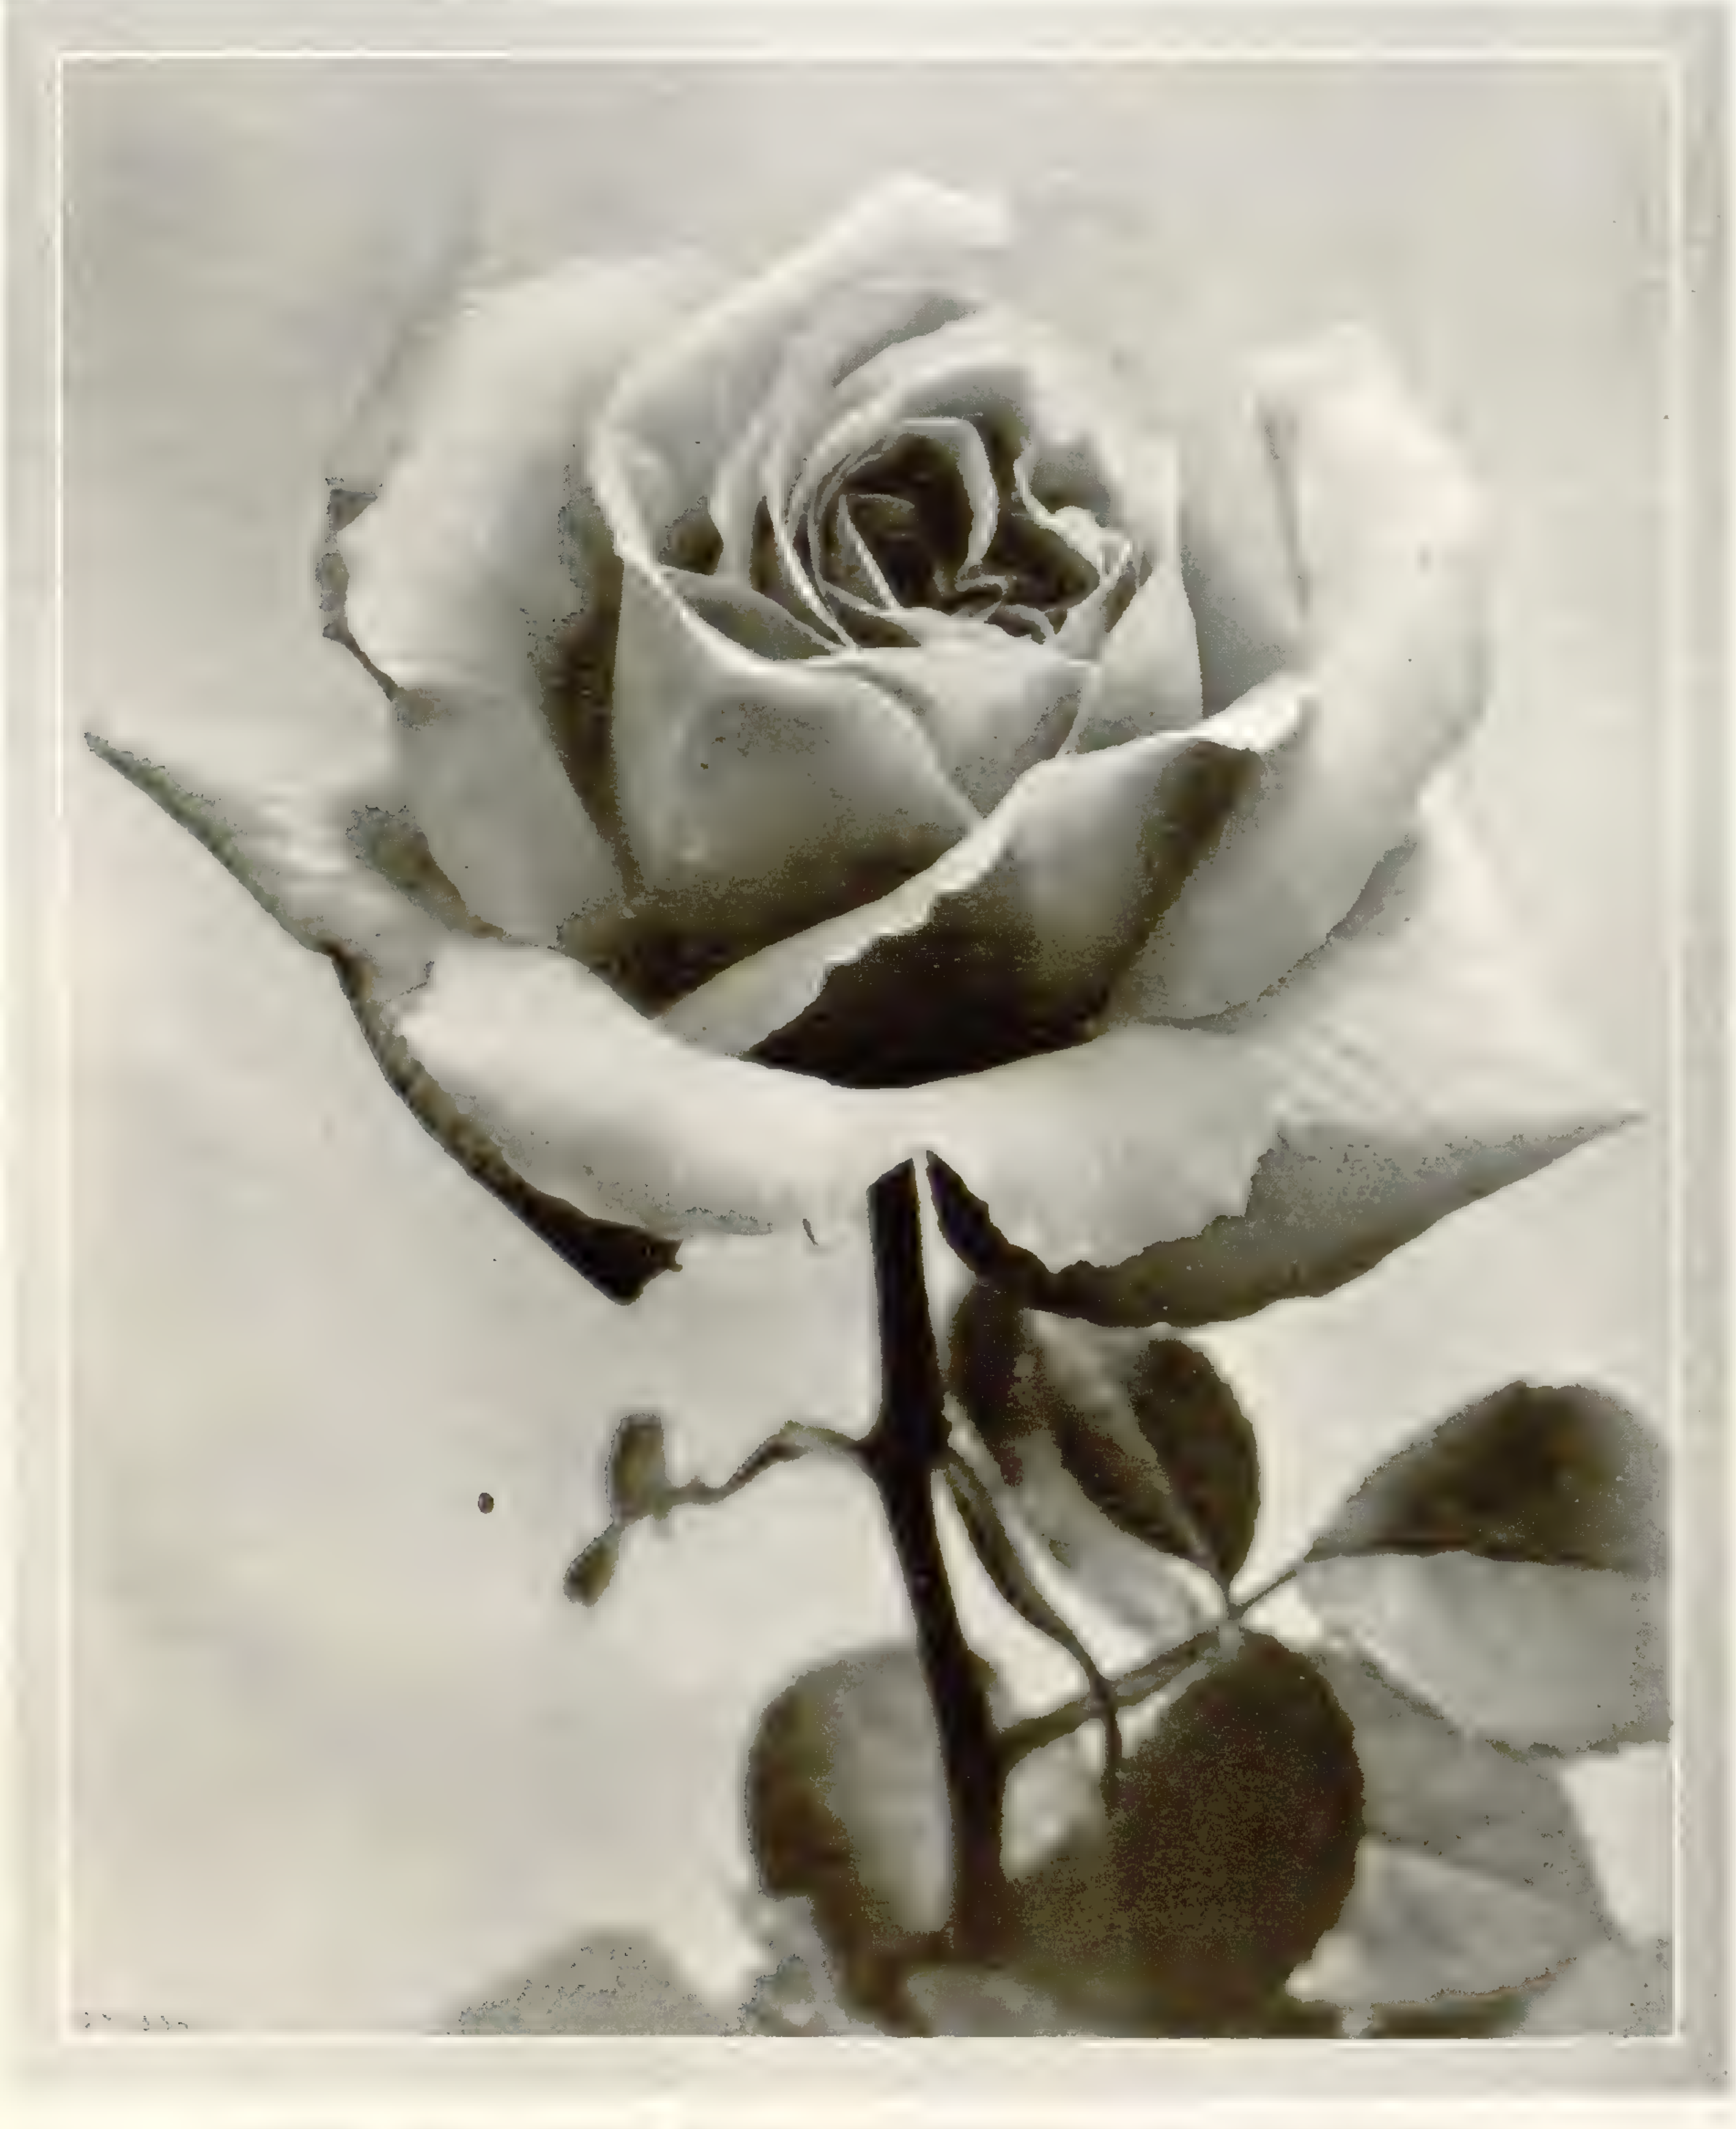
Out of the same seed pod more than one distinct variety has resulted. In fact, we cannot be certain of any crosses. When one looks up the pedigree of a rose it seems incredible the result could be what it is, though in some cases, by working further back, we find distinct traces of atavism; Her Majesty, Frau Karl Druschki, and Gloire Lyonnaise, for example.

We have varieties subject to mildew and canker more than others, and yet another plant of the same variety, and placed side by side, may not develop the latter disease. One rose will open well with certain growers, and be a hopeless failure in the majority of cases with another. Again, a generally thin-petaled variety has not infrequently been so good with some as to find a worthy position in a winning exhibition box. The late Mr. A. Slaughter could frequently obtain Madame Charles with more substance than I saw from any other grower, and often staged it in his winning stands. With us Queen of Spain was a failure until the past season when it was one of our very best roses; and yet one might well fancy such a wet and dripping year was altogether against the opening of such a double and slow expanding variety.

Take the striped roses also, how seldom do we find one constant to any particular degree of shadings; not infrequently coming self-coloured, and often varying in a remarkable manner. Again, take such roses as Lady Roberts, Prince de Bulgarie, and Madame Lambard, the way these vary is remarkable. Oftentimes we could cut an almost perfect Madame Hoste from Lady Roberts, or a Clara Watson from Prince de Bulgarie. William Allen Richardson will sometimes produce a light-coloured flower that much resembles La Marque, and this not infrequently upon the same truss with the orange-yellow so much sought after in this variety.

In the late autumn many roses are quite unrecognisable, and it is because several have reached me for naming under the impression they were wrong that has induced me to pen these few lines. May I also take this opportunity of saying how unreasonable it is to send some peculiar flower without any guide as to growth, and often only the mere bloom minus any wood prickles or foliage, and expect one to give a correct name. When we consider only a few of the above variations it must be obvious how difficult and unsatisfactory such a task must be.

A. Piper.



NEW H.T. ROSE 'MARY COUNTESS OF ILCHESTER.

Flowers rich rose shaded with pale purple-violet. Raised by Messrs. Alex. Dickson and Sons, Lim.

NEW ROSE MARY COUNTESS OF ILCHESTER.

This beautiful rose which Messrs. Alexander Dickson and Sons submitted to public notice during the past summer is, by common consent, one of the finest of the many good hybrid teas that have been raised at Newtownards. The growth is free, and the blooms are large, full, and of superb form, the colour rich rose, shaded with pale purple-violet. As an exhibition rose there can be no question as to its value, and we shall be much surprised if it does not take a prominent position among the higher-class roses suitable for bedding. The variety received an Award of Merit at the exhibition held by the Royal Horticultural Society at Holland Park on July 5 of the current year.

Aubrietia Prichard's A1.—This variety is claimed to be a much better one than Dr. Mules (which it somewhat resembles) by the raiser. It is certainly a much deeper violet, and the individual flowers are larger. Plants, when in full blossom, look charming, and form striking objects on rockeries, especially when grown in masses. But they are equally effective as edgings to borders, or as a groundwork for bulbous plants. Inexperienced cultivators should well prepare the soil before putting in the plants; if planted on the level and the soil be of a stiff nature, some gritty material must be mixed with it.—G. B.

SINGLE CHRYSANTHEMUMS.

Years ago there was an idea in the mind of many skilful cultivators that because a flower was single it did not deserve to be cultivated. One of the leading gardeners of the present day was of this opinion, and would not tolerate a single chrysanthemum in the garden over which he so ably presides. Now he is so strongly imbued with the value of single varieties that his stock of many hundred plants is almost confined to this section! He is loud in the praise of the good varieties, and smiles at his previous objections. As far back as 1885 I grew many plants of this section, having seen them so well displayed at the Birmingham shows. I also wrote strongly of the advantage of the section for decoration, and endeavoured to interest my friends in their culture, knowing quite well how such a type of flower must eventually become popular.

[Photo: Miss S. M. Wallace.

A ROCKERY MARGIN TO A STRAWBERRY BED.

Nineteen years since I wrote an article in the **Gardeners' Magazine** describing as many as thirty varieties, and even at that time there was a remarkable range of colouring in those available. Previously the fault of the objectors to the section was that there were no bright colours. In that list I placed Mary Anderson at the head, and even now this variety is much appreciated, and its shapely blossoms are accepted as an ideal by many. Another variety, Mrs. Langtry, was at that time very popular, and its sweet violet-like perfume was much appreciated; now it is seldom seen, owing, presumably, to its small flowers. The rage is now for size, and many flowers are obtainable five inches in diameter, and even more.

The section is obtaining much greater recognition by committees of autumn shows than formerly, and that is the way to encourage its extension. I am not acquainted with any society that does not include singles in its prize list, and it is not unusual to find as many as ten or more competitors in a class for six varieties. Growing plants, too, now receive encouragement, either as specimens or in decorative groups. At Windsor last year, and at York, also, they were largely employed in groups.

In a cut state the flowers are frequently arranged with stems much too short to display the flowers to advantage; nothing sets off the blossoms better than their own foliage below. An interesting class would be that for so many varieties, and so many sprays or stems of each, not less than two feet, or even three feet long, and arranged in vases on the ground, without any accompaniment save their own foliage. Such a class would illustrate the true decorative value of the singles, and would do much toward making them more popular still.

Many early-flowering single varieties are being pushed forward, but I do not think this race is at all required, because out of doors single flowers are not nearly so effective as they are under glass. I also believe too many ordinarily November flowering sorts are being introduced that have little in the way of improvement to recommend them above well-known sorts. Those who have the power should raise the standard before conferring certificates. I do not agree with the ideal of one row of florets only, for, as a rule, such flowers have a "skimpy" appearance, especially if they are cup-shaped. One of the finest types of single-flowered varieties I have yet seen is named Mensa, which has as many as four rows of ray florets, and which does not look objectionable. In this case the florets recurve a little at the tips, are wide at the base, and form a charming blossom, set off as it is by a perfectly formed large yellow disc, which contrasts pleasantly with the white florets.

Another good variety is Sir Walter Scott, with narrow and drooping florets in not more than two rows. The blooms are from four inches to five inches in diameter, and deep rich yellow. These two form a brace of almost perfect varieties, yet opposite in some respects, which goes to prove that a hard and fast line is not always desirable. Both these varieties produce their blooms in clusters of three to six, and the blooms in each cluster open simultaneously, thus enhancing their value for decoration.

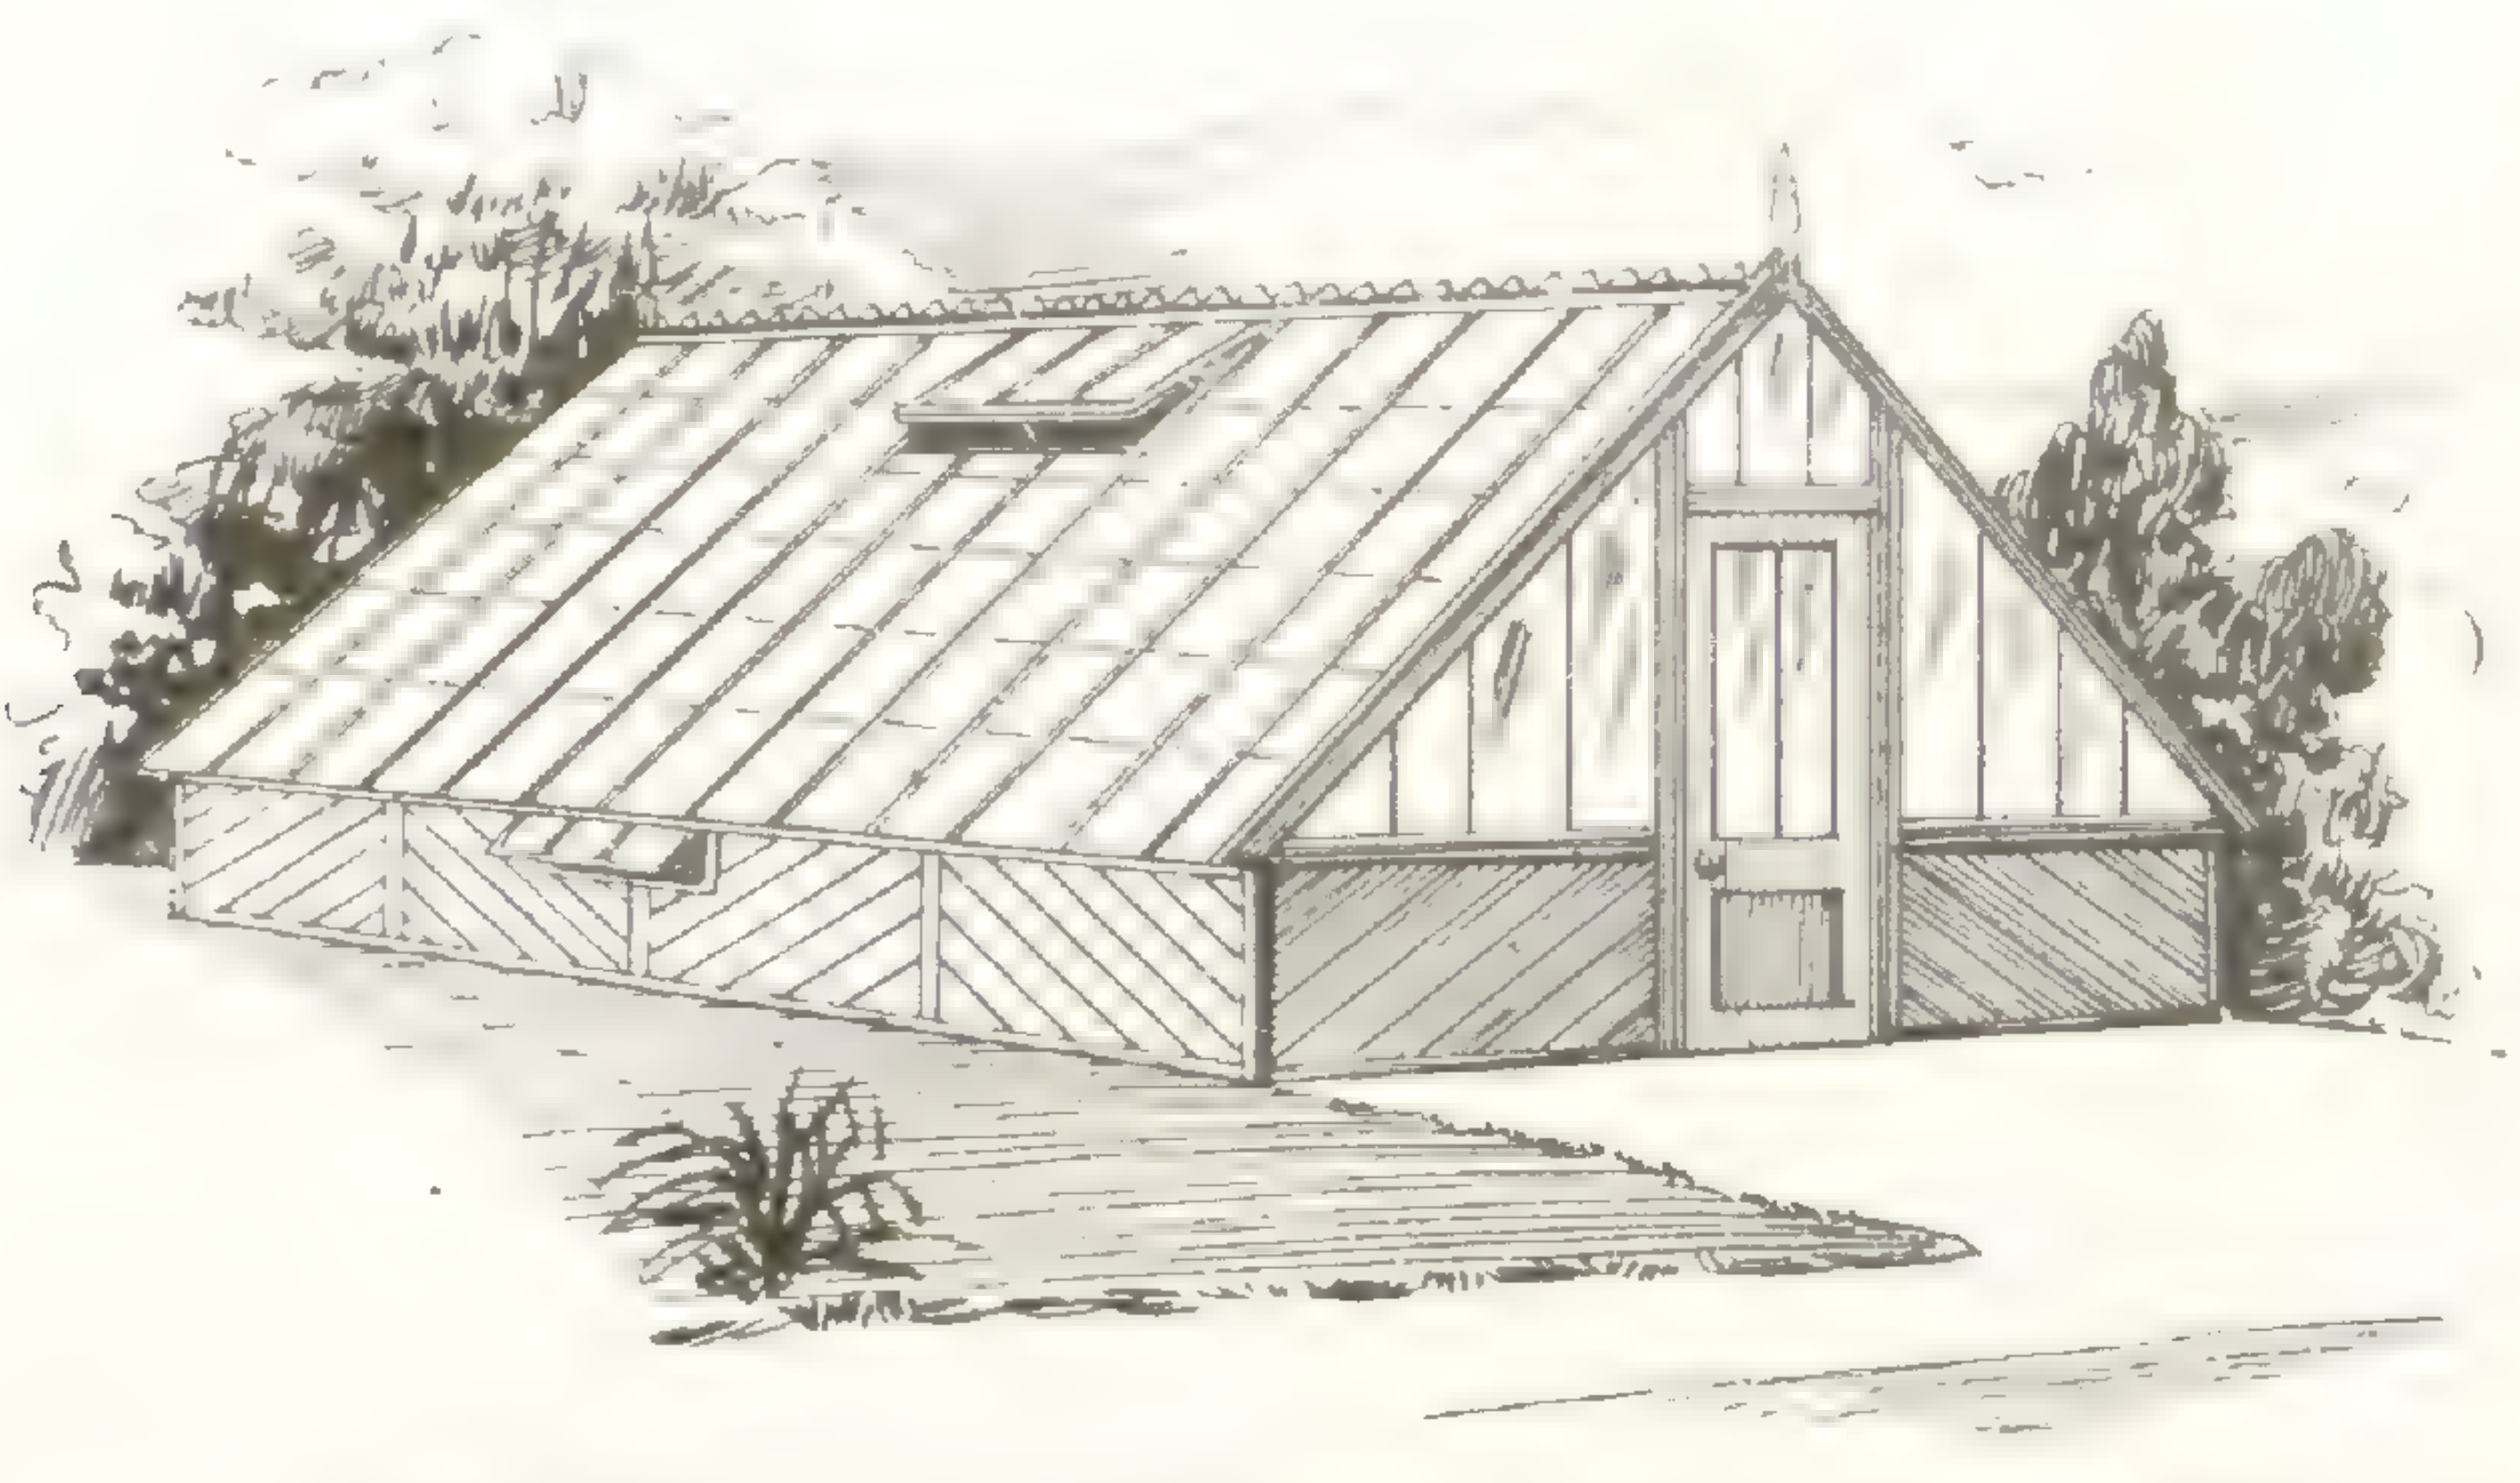
Swanmore Park. E. Molyneux.

MELIOSMA VEITCHIORUM.

Until recently members of the genus Meliosma were cultivated in greenhouses, except in the most favoured parts of the country, where an example or two might occasionally be noted out of doors. The introduction of M. Veitchiorum has, however, made it possible to have the genus represented in outdoor collections in counties which do not enjoy such exceptional climatic conditions as Cornwall and Devonshire. It was collected by Mr. E. H. Wilson in Western China at altitudes ranging between 5,000 and 7,500 feet, where it is said to grow into a tree 30 feet high. Like the other meliosmas, it has ornamental foliage. The leaves in this case are pinnate, and 15 to 24 inches long, usually with nine leaflets. Those on the best developed leaves may be up to seven inches long and 3½ inches wide, but on smaller leaves they range from 3½ to 4 inches long and are about 2 inches in width. The individual flowers are small, but they are borne profusely in large panicles. They are succeeded by round, dark coloured fruits, which are rather more than a quarter of an inch in diameter. It appears to succeed in well-drained loamy soil, in a position where shelter from cold winds is afforded, and when once well established, moderately fast growth is made. As a specimen for a conspicuous position on a lawn it has much to commend it, especially in gardens where choice and out-of-the-way subjects are encouraged. W. D.

DESIGN IN FORCING HOUSES AND PITS.

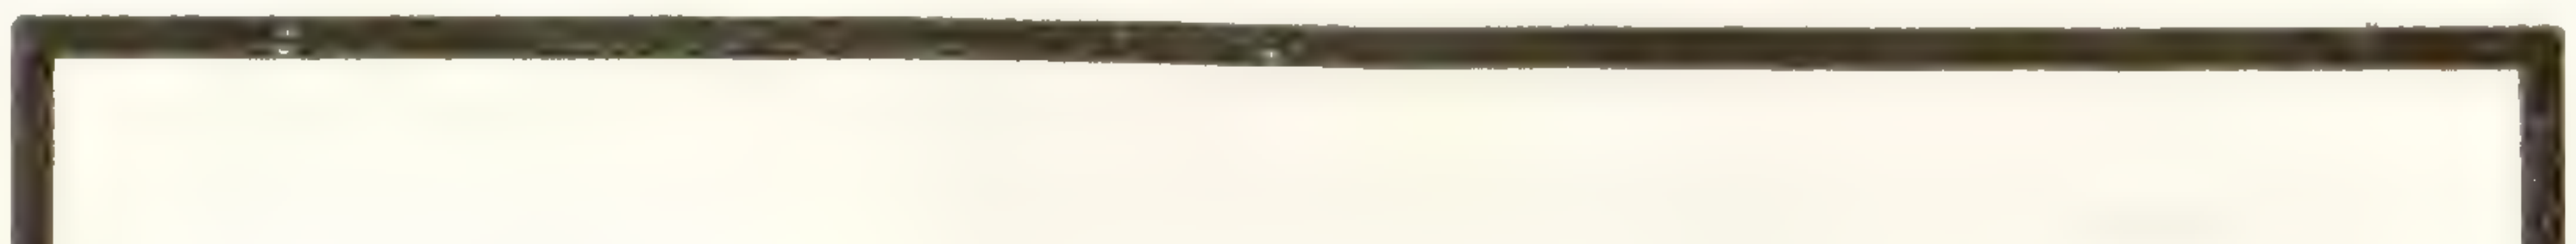
In making a brief reference to some examples of design in forcing houses and pits it is hardly necessary to say that the construction of houses and pits for the forcing of fruits, flowers, and vegetables of the usual designs form a large and important part of the extensive business of Messrs. W. Duncan Tucker and Sons, Stafford House, 27, Cannon Street, London. Evidence of this is found in many gardens, both commercial and private, in various parts of the United Kingdom, and on referring to the illustrated catalogue issued by the firm it will be seen that owners of gardens have full scope for the exercise of their taste in the matter of design, and have no difficulty, with the aid of the firm, in selecting, according to the purpose for which the structure or structures may be required. We mention this much to avoid any misapprehension on the part of those who are not fully conversant with the scope of the firm's operations, because, instead of referring to their structures of the usual type, we are desirous of giving a brief description of the quite new form of forcing house they have introduced.



PORTABLE SPAN-ROOF FORCING HOUSE.
Erected by Messrs. W. Gardam and Sons, Lim., Staines.

This new structure is known as the "Caloricult," and its design is well shown in the accompanying illustration. Consisting almost wholly of glass, it is not difficult to imagine that it forms a veritable trap for sun heat, and, provided with double lights, it is evident that it has the power of retaining for the longest possible period the heat that has been caught. The construction of the house of double glass with an air space between insulates the interior, and ensures an equable temperature, which is so important a factor in the acceleration of the growth of the various fruits and flowering plants required for furnishing supplies early in the year. The structure illustrated is 31ft. long by 7ft. wide at the base, and the roof has a slope of 8ft. The latter can be removed when the house is no longer required, and the lights be utilised as a covering for frames that are devoted to the production of crops of cucumbers, melons, tomatoes, and some of the late vegetables that derive advantage from the shelter of glass. The structure is heated artificially by means of hot water pipes fixed below the bed of soil and covered by an iron core.

With a history extending over upwards of a hundred years, and examples of their work in an immense number of gardens in the United Kingdom, Messrs. J. Weeks and Co., 72, Victoria Street, Westminster, require no introduction, and it is certainly not necessary to refer otherwise than in the briefest manner to the excellent design and the high quality of the glass structures erected by them. We would like to write of the handsome conservatories and winter gardens, and of the plant and fruit houses that have come under notice, but the subject is forcing houses and pits, and to these perforce must this note be confined. We have selected a section of a lean-to forcing house for the purpose of illustration; and, although it does not produce quite such an imposing effect as would a view of the house, it posseses greater educational value. It shows the reader how skilful has been the arrangement of the heating apparatus both for providing top and bottom heat. Here we have a bed that may be formed with a rich compost for cucumbers or melons, or with some suitable material in which to plunge pots containing cuttings, or the pots in which are growing plants that derive assistance from bottom heat during the earlier stages of their development. At the back is a stage for plants not requiring bottom heat. It will be seen that the pipes underneath the bed are ample for the maintenance of the requisite heat in the bed, and that it can be easily regulated by means of the openings with their shutters, that are provided in the wall next the pathway. The pipes provided for furnishing the top heat indicate an excellent arrangement for obtaining an equal distribution of warmth throughout the house.



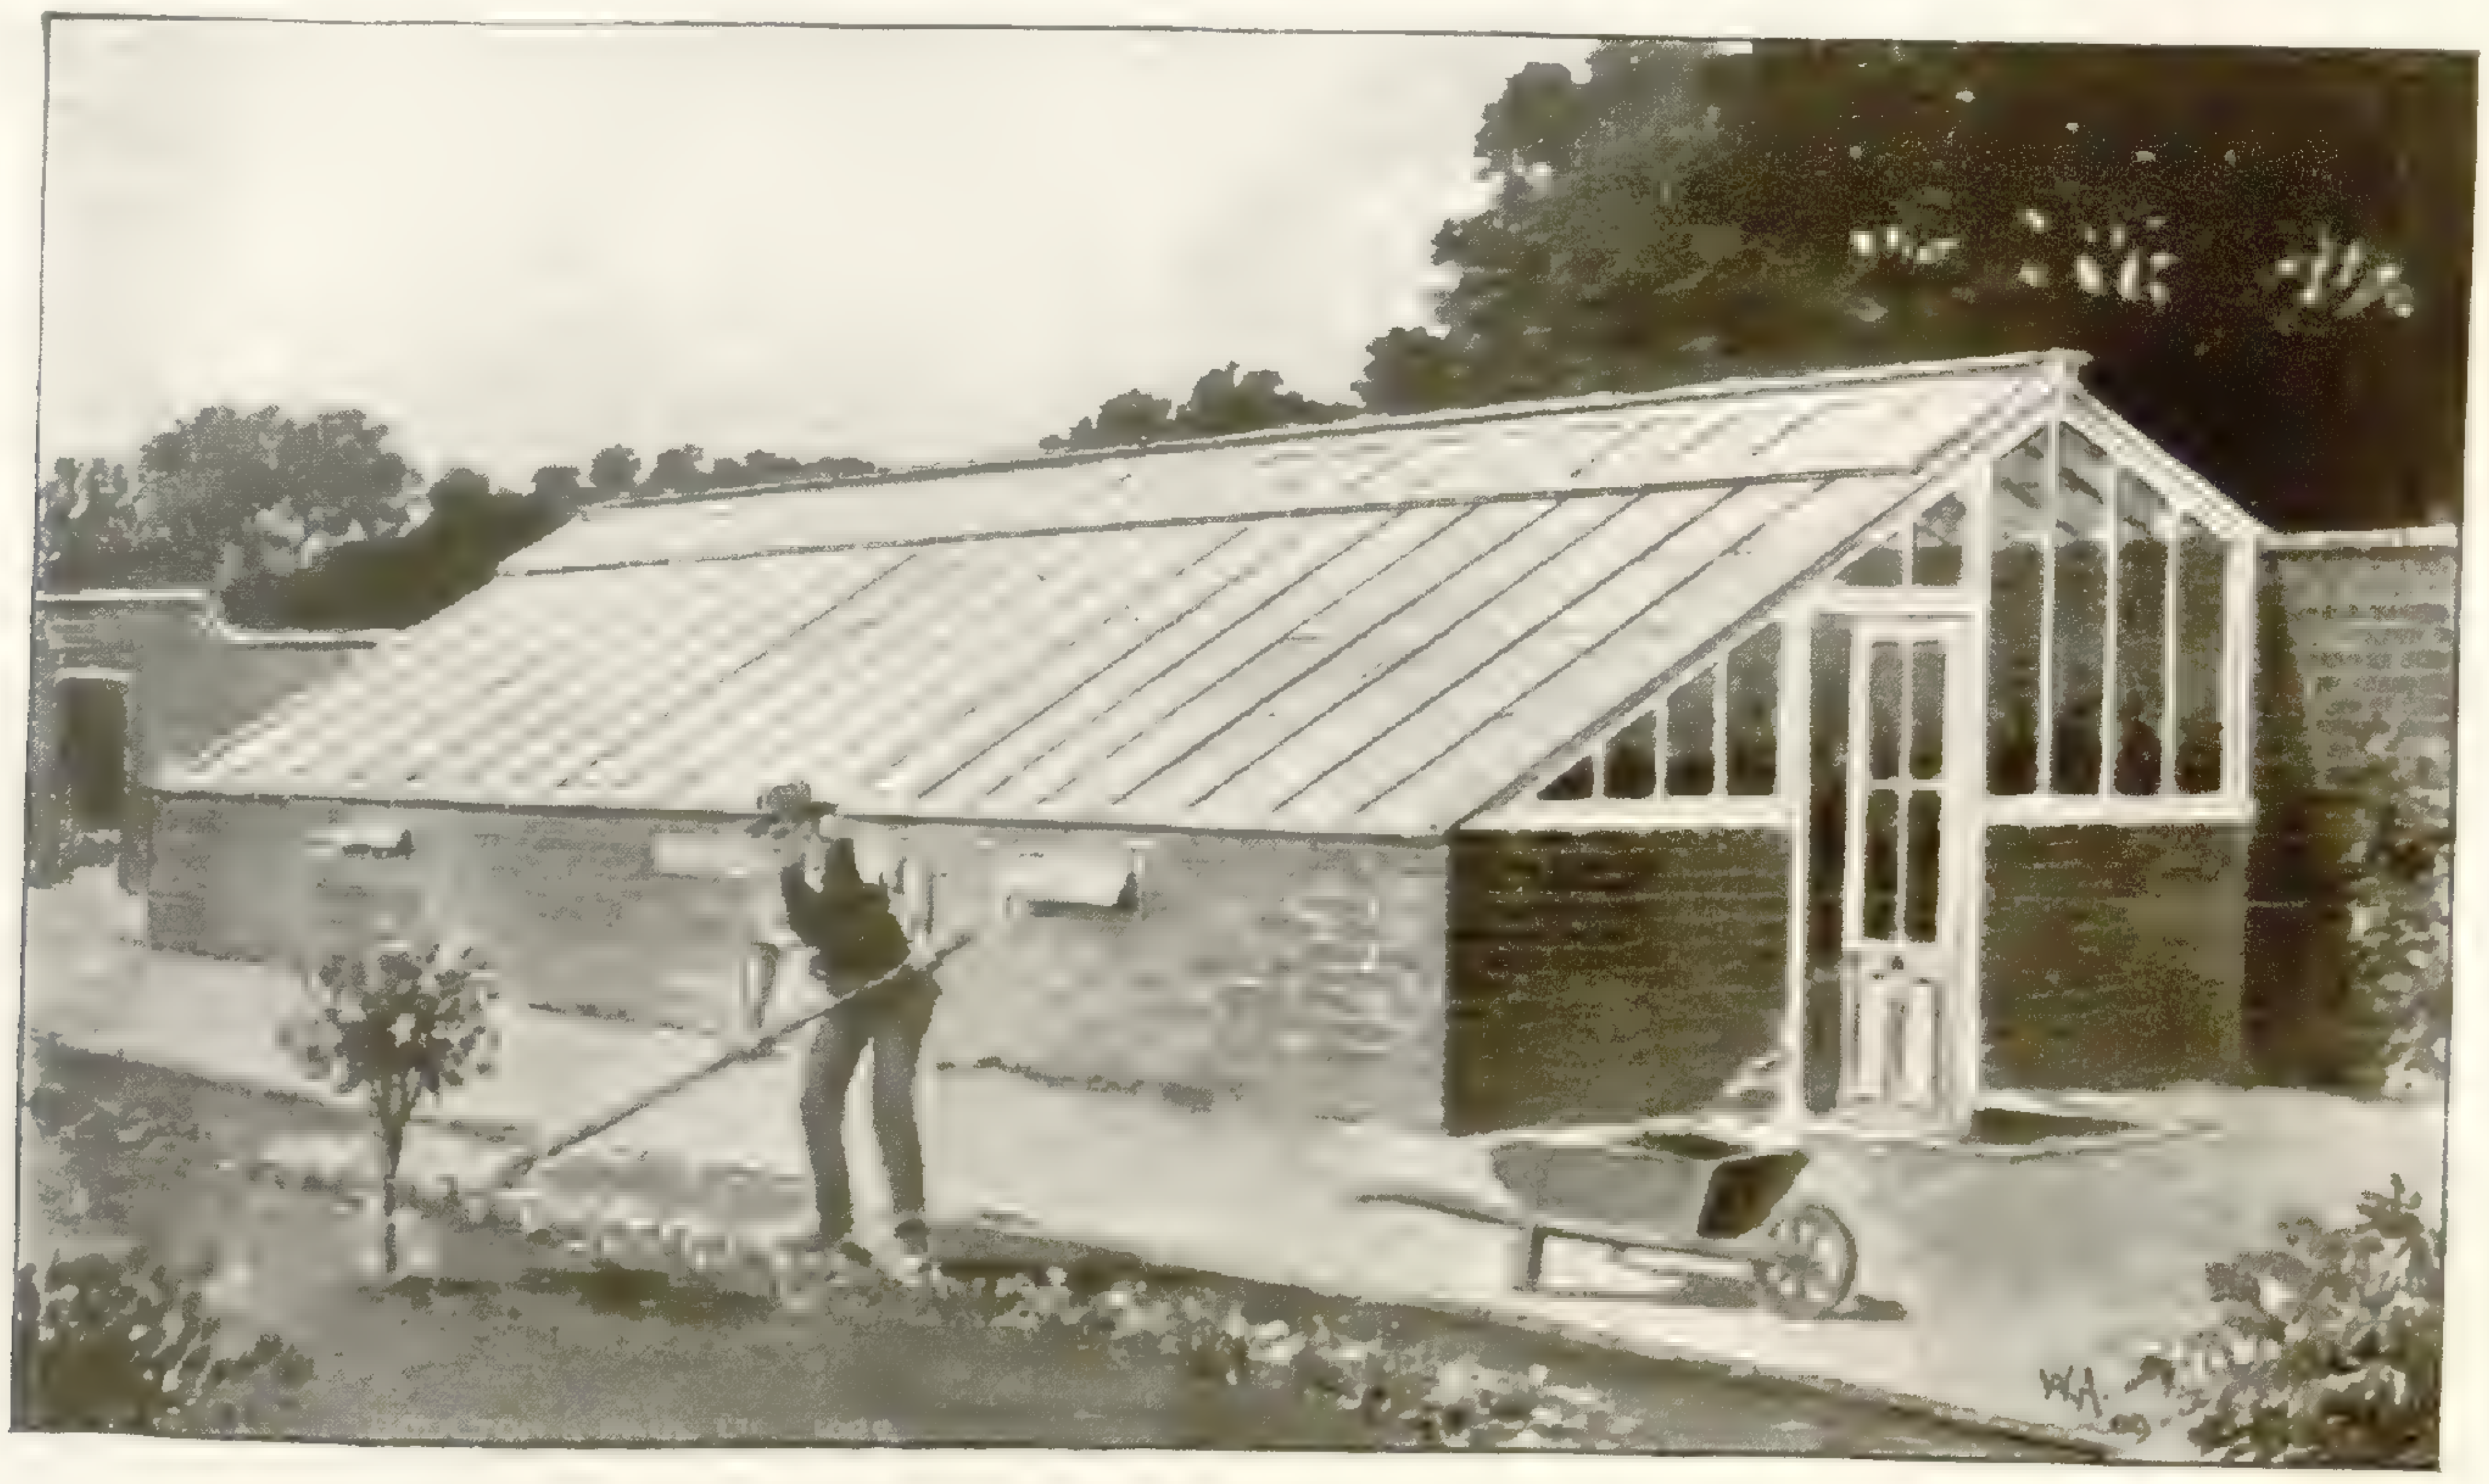
SECTION THROUGH A LEAN-TO FORCING HOUSE.
Erected by Messrs. J. Weeks and Co.

While Messrs. Boulton and Paul, Lim., of Norwich, have long occupied a prominent position as builders of more or less ornate conservatories and winter gardens, and spacious plant and fruit houses, the construction of forcing houses and pits form an important feature of their extensive and many-sided business. A number of designs of such structures have a place in their catalogue, and we have selected an illustration of a three-quarter span forcing pit as representing an excellent type of building. Lean-to, three-quarter span, and span-roof houses and pits all have their advantages, and among those possessed by the three-quarter type may be mentioned the additional head room obtained down the middle of the house and over the staging at the back, as compared with the lean-to. The principal ventilation in this as in other structures used for forcing purposes, is effected by means of the lights near the apex of the roof, and early in the season the air will be wholly admitted by the roof ventilators for considerable periods; but openings, with well-fitting shutters, are provided in the front wall, so that a circulation of air through the house can be readily obtained when considered desirable.

There are various reasons why forcing houses and pits should in certain instances, as in the case of some other glass structures, be of a portable character—as, for example, when the tenant holds his dwelling house and garden under a three-years' agreement. For this reason a forcing house or pit that comes under the category of a tenant's fixture is of great advantage to many tenants who take a keen interest in their gardens, and know the great assistance a forcing house will render in the production of early supplies of flowers, strawberries, etc., and in the raising of the requisite stocks of plants for beautifying the flower garden. We have pleasure in directing attention to the portable houses manufactured by Messrs. W. Gardam and Sons, Lim., The Wharf, Staines. Like other structures manufactured by this well-known firm, they are made of materials that are in every way suitable for the purpose, and can be depended upon to remain in excellent condition for the full period. The sizes listed by the firm range from 7ft. by 5ft. to 50ft. by 14ft., and we have no doubt that the houses, both span-roof and lean-to, may be made of any desired dimensions.

Recognising their value to an important section of garden lovers, Messrs. Browne and Lilly, Lim., Fobney Works, Reading, have for some years devoted considerable attention to forcing houses that comply with the conditions of tenants' fixtures, and the largely increased demand they have to meet show that they accurately gauged the requirements of occupiers of gardens whose tenancy is terminable at short notice. It is not necessary to repeat what has been said with reference to the advantages of portable houses when the dwelling-house and garden are held on a short lease, or when they may have to be given up on a comparatively short notice. Suffice to say they are great, and that a structure in which a temperature from 10 to 15 deg. higher than that of a greenhouse is maintained is most useful for the raising of stocks of various classes of plants required for the decoration of the conservatory and furnishing the flower garden, and also for raising stocks of certain vegetables for planting out, after having been duly hardened, early in the season. The houses can be efficiently heated, as in the case of permanent structures, and it need hardly be said that the materials and the workmanship in the houses executed by this firm are of an equal degree of excellence.

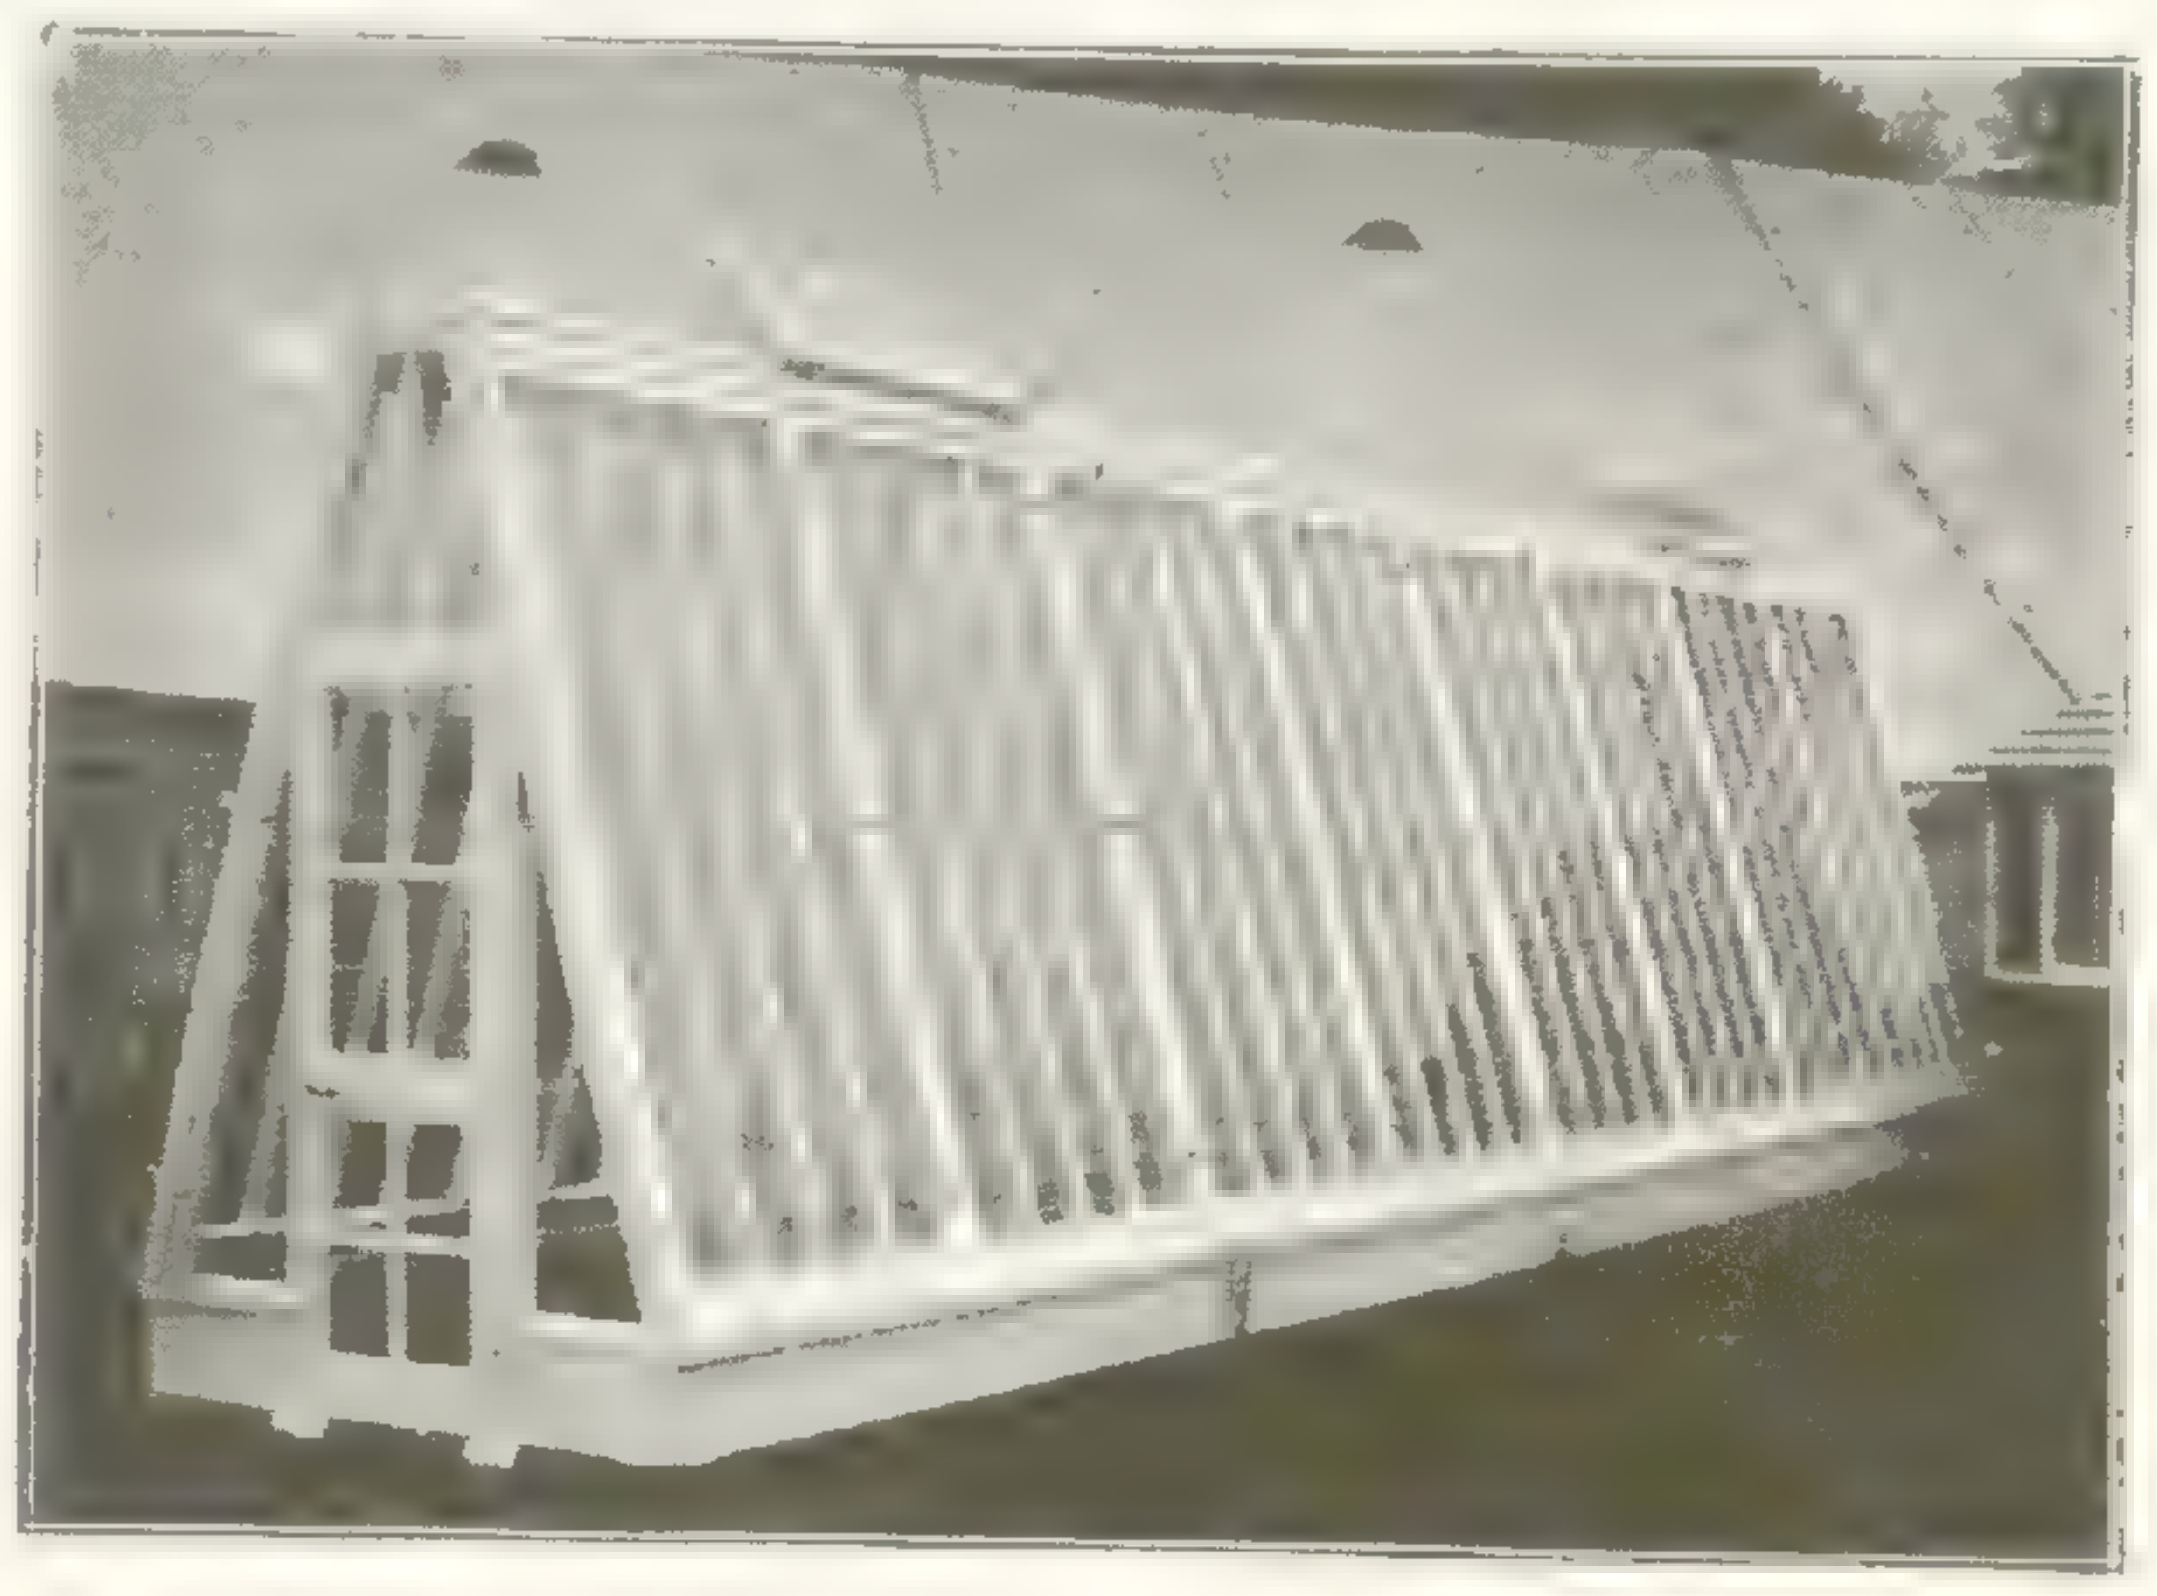
BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in THE AMATEUR'S GREENHOUSE, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.



THREE-QUARTER SPAN FORCING PIT.
Erected by Messrs. Boulton and Paul, Lim., Norwich.

GRAPE PRINCE OF WALES.

I have not had the opportunity of growing this grape myself, but I have seen it many times in the hands of others. I saw specimens of it when it was first shown by Messrs. J. Veitch and Sons, and I saw also those grand examples grown at Stanmore by Mr. Ellis. Since then I have seen it growing under various methods of culture, and have come to the conclusion that the treatment successfully accorded its parent, Mrs. Pince, from which it is a sport, is what is required. As long ago as 1875 I saw Mrs. Pince growing in the Garston Vineyard, Liverpool, under the control of the late Mr. Meredith, and no finer specimens have been seen since. There this grape occupied an inside border, and in the same manner Mr. Shingler has produced extremely fine examples; he is a staunch believer in the restriction of the roots, so that they are under control, not only for this variety, but all sorts of grapes.



THE CALORICULT, A NEW FORM OF FORCING HOUSE.
Constructed by Messrs. W. Duncan Tucker and Sons, Lim.

Prince of Wales is of vigorous growth, and does not require the aid of any other variety as stock, therefore it is best grown on its own roots in a border quite under control, and given a somewhat high and dry temperature while in flower. I am sure when this grape is better known it will become an universal favourite for late use, as it possesses all the attributes of a perfect grape—size of both bunch, berry, shape, colour, and flavour.

E. MOLYNEUX.

In his note on this variety Mr. Pirie (p. 731) also mentions Lady Hastings and Melton Constable. I can sympathise with Mr. Pirie in his dissatisfaction with these two varieties. In my time I have had attacks of the novelty fever, from some of which I have escaped, to my satisfaction, but in others have suffered somewhat severely. After personal attacks one understands the symptoms much better.

I do not think I have a word to say in favour of Lady Hastings grape, for, after two attempts, I discarded it. Who of your readers have grown this grape and have been satisfied with it? Perhaps Mr. Shingler will give us his experience of it, and the best way to cultivate it. When first sent out it was said to be a vigorous grower, but I never found it so, and I never had any fruit worth looking at from it.

The variety Melton Constable, when grown on its own roots, appears to be practically the same as Gros Colmar, and, therefore, for that reason I do not consider it worth cultivation, as one grape of Gros Colmar type is sufficient. I was induced to buy it after tasting some of the grapes at the last fruit show held at Chiswick, and from what I now know of the variety I should say the vine from which those grapes were cut was inarched on to another variety. I also exhibited, for the introducer, several fine bunches of Melton Constable later in the autumn of that year. In appearance, berry, and flavour of those bunches there was much to recommend the variety.

I have grown Melton Constable inarched on Black Hamburgh, and also on Black Alicante, and, grown in this way, it is useful for giving variety, where that is desired, but beyond that there is little to recommend it. Appley Towers is worth growing in late and midseason houses. Lady Hutt seems most satisfactory in a late house, but appears to succeed best grown on the extension system; it would be improved by having Muscat temperature.

I believe it will be found that the variety Prince of Wales will be more satisfactory on the extension than on the spur system. I saw a vine of this variety quite recently which was already showing signs of what the restriction principle would eventually do; it may be that here we solve the question of the non—"setting" of Prince of Wales.

T. H. SLADE.

Turnips from the late sowings have made excellent progress during the last few weeks. The most serviceable bulbs should be pulled, placed in small clamps, and covered with sand: they will then remain in good condition over a long time at this season, and be free from frost. If any remaining bulbs in the beds are likely to be fit for pulling later on, draw a little soil over them to ward off frosts.—G. ELLWOOD.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

IMPORTED CATTLEYAS.—From the present time onwards, importations of various species of cattleyas and lælias will be arriving at intervals. Unlike the hybrids which have been raised under artificial conditions, most of the species of the cattleya family are usually found to deteriorate after a few years' cultivation, and it is therefore desirable that the old stock should be replenished as opportunities offer themselves; and as it is in most cases desirable to secure freshly imported plants in preference to those that have been started into growth, the opportunities of securing them should be embraced as soon as possible after the plants arrive.

CATTLEYA DOWIANA.—I noticed that Cattleya Dowiana has been extensively advertised of late. This plant should not be confounded with the variety C. D. aurea. The flowers are in many respects similar, but the habit of growth is so dissimilar that they can easily be distinguished out of flower. C. D. aurea is by no means a difficult plant to keep in robust health for successive years, but the more beautiful and desirable C. Dowiana, although to all appearances more robust and vigorous in habit of growth, is usually found a most difficult plant to keep in a desirable condition for many years in succession, and as it is a long time since any quantity of this species has been imported, no doubt the plants will have become plentifully distributed in our gardens. There is no orchid that reaches this country in a more satisfactory condition in respect to retaining its leaves in good condition than C. Dowiana, and with a little care when the plants are first unpacked they are induced to retain these well. Where there is ample foliage, roots are not long in making their appearance, so that they may be potted as soon as received.

POTTING.—When potting imported cattleyas and their allied genera at this season and through the winter months, it is desirable to use as little potting compost as possible about the base of the plants until root action commences. Select pots of a suitable size, or shallow pans sufficiently large to contain the plants comfortably; drain these to about half their depth with clean crocks, and after placing the plant in position a few sticks may be desirable to secure the pseudobulbs. Fill in the remaining space with broken crocks. Little root moisture will be required; lightly syringing the crocks about once a day will be ample under the most favourable conditions. As soon as the new roots make their appearance the crocks on the surface may be removed, and about equal portions of osmunda fibre and peat, or polypodium fibre, be added. Give a good watering as soon as the potting is completed. The plants should not be encouraged to commence growth rapidly, for the longer they can be retarded the better, so that they may have full advantage of the summer to develop and mature their growths.—H. J. Chapman, Oakwood Gardens.

FRUITS UNDER GLASS.

LATE-KEEPING GRAPES.—These may be kept upon the vines until the end of December, or gathered earlier and placed in the grape room, as circumstances dictate. In good waterproof houses, devoted entirely to the vines, late varieties, such as Gros Colmar, Lady Downes, Lady Hutt, Alicante, and Appley Towers, may be kept to advantage upon the vines to the end of the year; but in the case of badly-constructed houses, or those in which plants have to be accommodated during winter, it is better to cut the grapes at an earlier date, and store them in the grape room. All varieties of Muscats and others, except the latest keepers, should, however, be cut and stored by the end of November, and in the case of all grapes it is well to remember that vines cannot support ripe fruit for a lengthened time without their suffering more or less. While grapes are hanging the temperature of the house should be kept at 50 or a few degrees lower in severe weather, ventilation being discreetly given when external conditions are suitable. If it should be necessary to water inside borders, do so early in the morning of fine days, and expel the atmospheric moisture thus promoted by warming the pipes, and both by day and night slightly opening the ventilators; in order to check evaporation, give the border a covering of clean straw. Previous to cutting the fruit cleanse the grape room, and bottles, fill the latter with clean water, place in each bottle a piece of charcoal, and fix them in the rack. When gathering the grapes, be careful not to rub the berries, cut the laterals immediately above the buds required for next year's crop, and leave the points their full length. When placing the laterals in the bottles, see that their ends reach the water, and subsequently keep the bottles filled with water, decaying berries removed, and the temperature of the room at about 50 deg.

PRUNING VINES.—It is a good practise to prune the rods in each vinery as soon as they have lost their leaves, provided the fruit has been gathered, for early pruning has beneficial influences, inasmuch as it concentrates the sap upon the buds that yield the next year's crop of fruit, and thus in this direction prevents waste of energy. It also secures complete rest, and to a great extent prevents bleeding. In spur pruning, which is both the most simple and most generally adopted method, each lateral should be cut back to two sound basal buds, for, though in the case of vigorous young vines good crops may be often secured by pruning back to one bud, there is generally greater certainty about having good crops when two buds are left, and surplus shoots thus encouraged can be simply dispensed with by disbudding as soon as the fruit shows.

STRAWBERRIES.—There should be no further delay in placing strawberries in quarters where they will keep in a healthy condition, and where the pots can be protected from injury by frosts. For those at least that have been prepared for early forcing accommodation should be found in cool pits, or frames, where the pots should be plunged in tree leaves or cocoanut-fibre refuse, and protected by lights in severe weather. Those that cannot be treated in this way may be firmly plunged closely together, to the rims of their pots, in beds of fine ashes, the sides of the beds being supported by planks placed on edge. Plants treated in this manner, provided the drainage is in good order, will receive no injury from exposure to rain, but as a protection to their pots they should be efficiently covered during spells of severe frosts by bracken, or a similar material. While the plants are at rest a favourable opportunity should be taken to top-dress with fresh compost, and in doing this first remove the surface soil, and then add fresh compost, and make tolerably firm with a rammer.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

CAULIFLOWERS.—Late plants will be found very useful for prolonging the season if they are lifted with a good ball of earth attached, and placed close together in pits or frames, whereas if left in their quarters they will succumb to frosts. Give them a good watering, and admit air in plenty on all possible occasions. Treated thus, very nice heads will turn in right up to the winter. Those sown in August and September for producing heads during the spring and early summer should be well cared for in the way of clearing the dead basal leaves away, stirring the soil, and admitting plenty of air.

CABBAGES.—Hoe regularly, and fill up any gaps from the seed bed. Prick out seedlings thickly in a sheltered quarter for spring planting, and for making good any vacancies that may appear at that time in the maincrop beds.

HORSERADISH.—It is a good plan to take up and trench a part of the bed annually, and the work can be done at this season. Take out all roots, laying the serviceable ones in soil or sand for winter use. Well trench the ground, incorporating a dressing of manure, and when completed, place selected thongs in rows, eighteen inches apart, one foot from each other, and six inches below the surface.

GLOBE ARTICHOKES.—These will now need protection; all worthless and decaying leaves should be cleared away with the flower stems, and the plants be dug round and given a dressing of four inches of cinder ashes placed around each crown. Bracken or long stable litter should be in readiness to place around the stools during frosty weather, but it must be drawn away during spells of open weather. To make sure of the crop young strong suckers should be taken up with a ball of earth, and put into ten-inch pots, placing them in cold frames for the winter; this is very necessary on very wet, heavy soils, and the plants will be found more fruitful than crowns which remain in one place for years.

CHICORY.—This can now be brought forward by placing the roots a few inches apart in a dark corner of the mushroom house, at intervals. More seakale can be placed in the same structure, but in larger quantities, as it will now respond more readily to forcing.

POTATOES.—Where these are planted early, it is not too soon to prepare the "sets" by placing them in an upright position, thickly, in boxes, on a base of leaf-soil, in a light cool house. Choose moderate-sized tubers. We find May Queen and Express two very good varieties for early use. As room can be found for the main crop seed potatoes, lose no time in laying them on shelves in a light, but not too dry, position just free from frost.

FRENCH BEANS.—Where room is available sow these at intervals in 60-sized pots, placing six seeds in a pot, finally putting them into 24-sized pots in a warm and light compost.

GENERAL.—Sow forcing carrots in frames on a mild hotbed. All endive of usable size should now be comfortably under cover; the late sowings that are small will stand under a wall for spring planting. Late sowing of lettuce can be pricked out thickly in cold frames for spring planting on mild hotbeds, and in sheltered positions outside. Beds of winter spinach should have every attention during favourable weather, and if in exposed localities a row of fir branches placed on the cold side of the crop will give useful shelter. Collect all garden refuse, and place on the rubbish heap, and, lastly, have in readiness plenty of protecting material for celery.—Geo. Ellwood, Swanmore Park Gardens.

"**Botanical Magazine.**"—The plants figured and described in the issue for November are **Xeronema Moorii**, a somewhat striking liliaceous plant, with bright red-purple flowers, which is a native of New Caledonia, where it is found growing on volcanic rocks at an elevation ranging from 3,000 to 5,000 feet above the sea level. Columnea Oerstediana, a handsome gesnerad, with slender pendant growths, and bearing comparatively large rich red-pink flowers; it is a native of Costa Rica, and was discovered about half a century ago. Pyracantha angustifolia, an attractive species, elegant in growth, and bearing a profusion of white flowers, which are followed by a plentiful crop of orange-coloured fruits; the species was discovered by Delavay in Yunnan in 1882, and was referred by Franchet in 1889 to Cotoneaster as C. angustifolia. Houlletia Sanderi, an interesting Peruvian species bearing cream-coloured flowers; Pleiocarpa mutica, a distinct stove shrub, introduced from the Cameroons, and bearing a profusion of white flowers, which are arranged in clusters, and are not unlike some of the bouvardias in form.

BY SPECIAL APPOINTMENT

BOULTON & PAUL, LTD
MAKERS NORWICH

MODERN GLASSHOUSES

Designed and Built by us, comprising the Latest Improvements in Construction, Ventilation, Heating, etc., will give continued satisfaction and profit.

Enquiries invited for

WINTER GARDENS, CONSERVATORIES, VINERIES, PEACH HOUSES, MELON HOUSES, GLAZED PORCHES.

Representatives sent to take particulars in any part of the Country.

HEATING APPARATUS installed in Country Houses, Churches, and Horticultural Buildings in the most economical manner.

GARDEN FRAMES in great variety, always in stock.

Full Instructions on Planting and Propagation of Hardy Plants and Flowers.

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6.**

SOME FEATURES OF THE WORK:

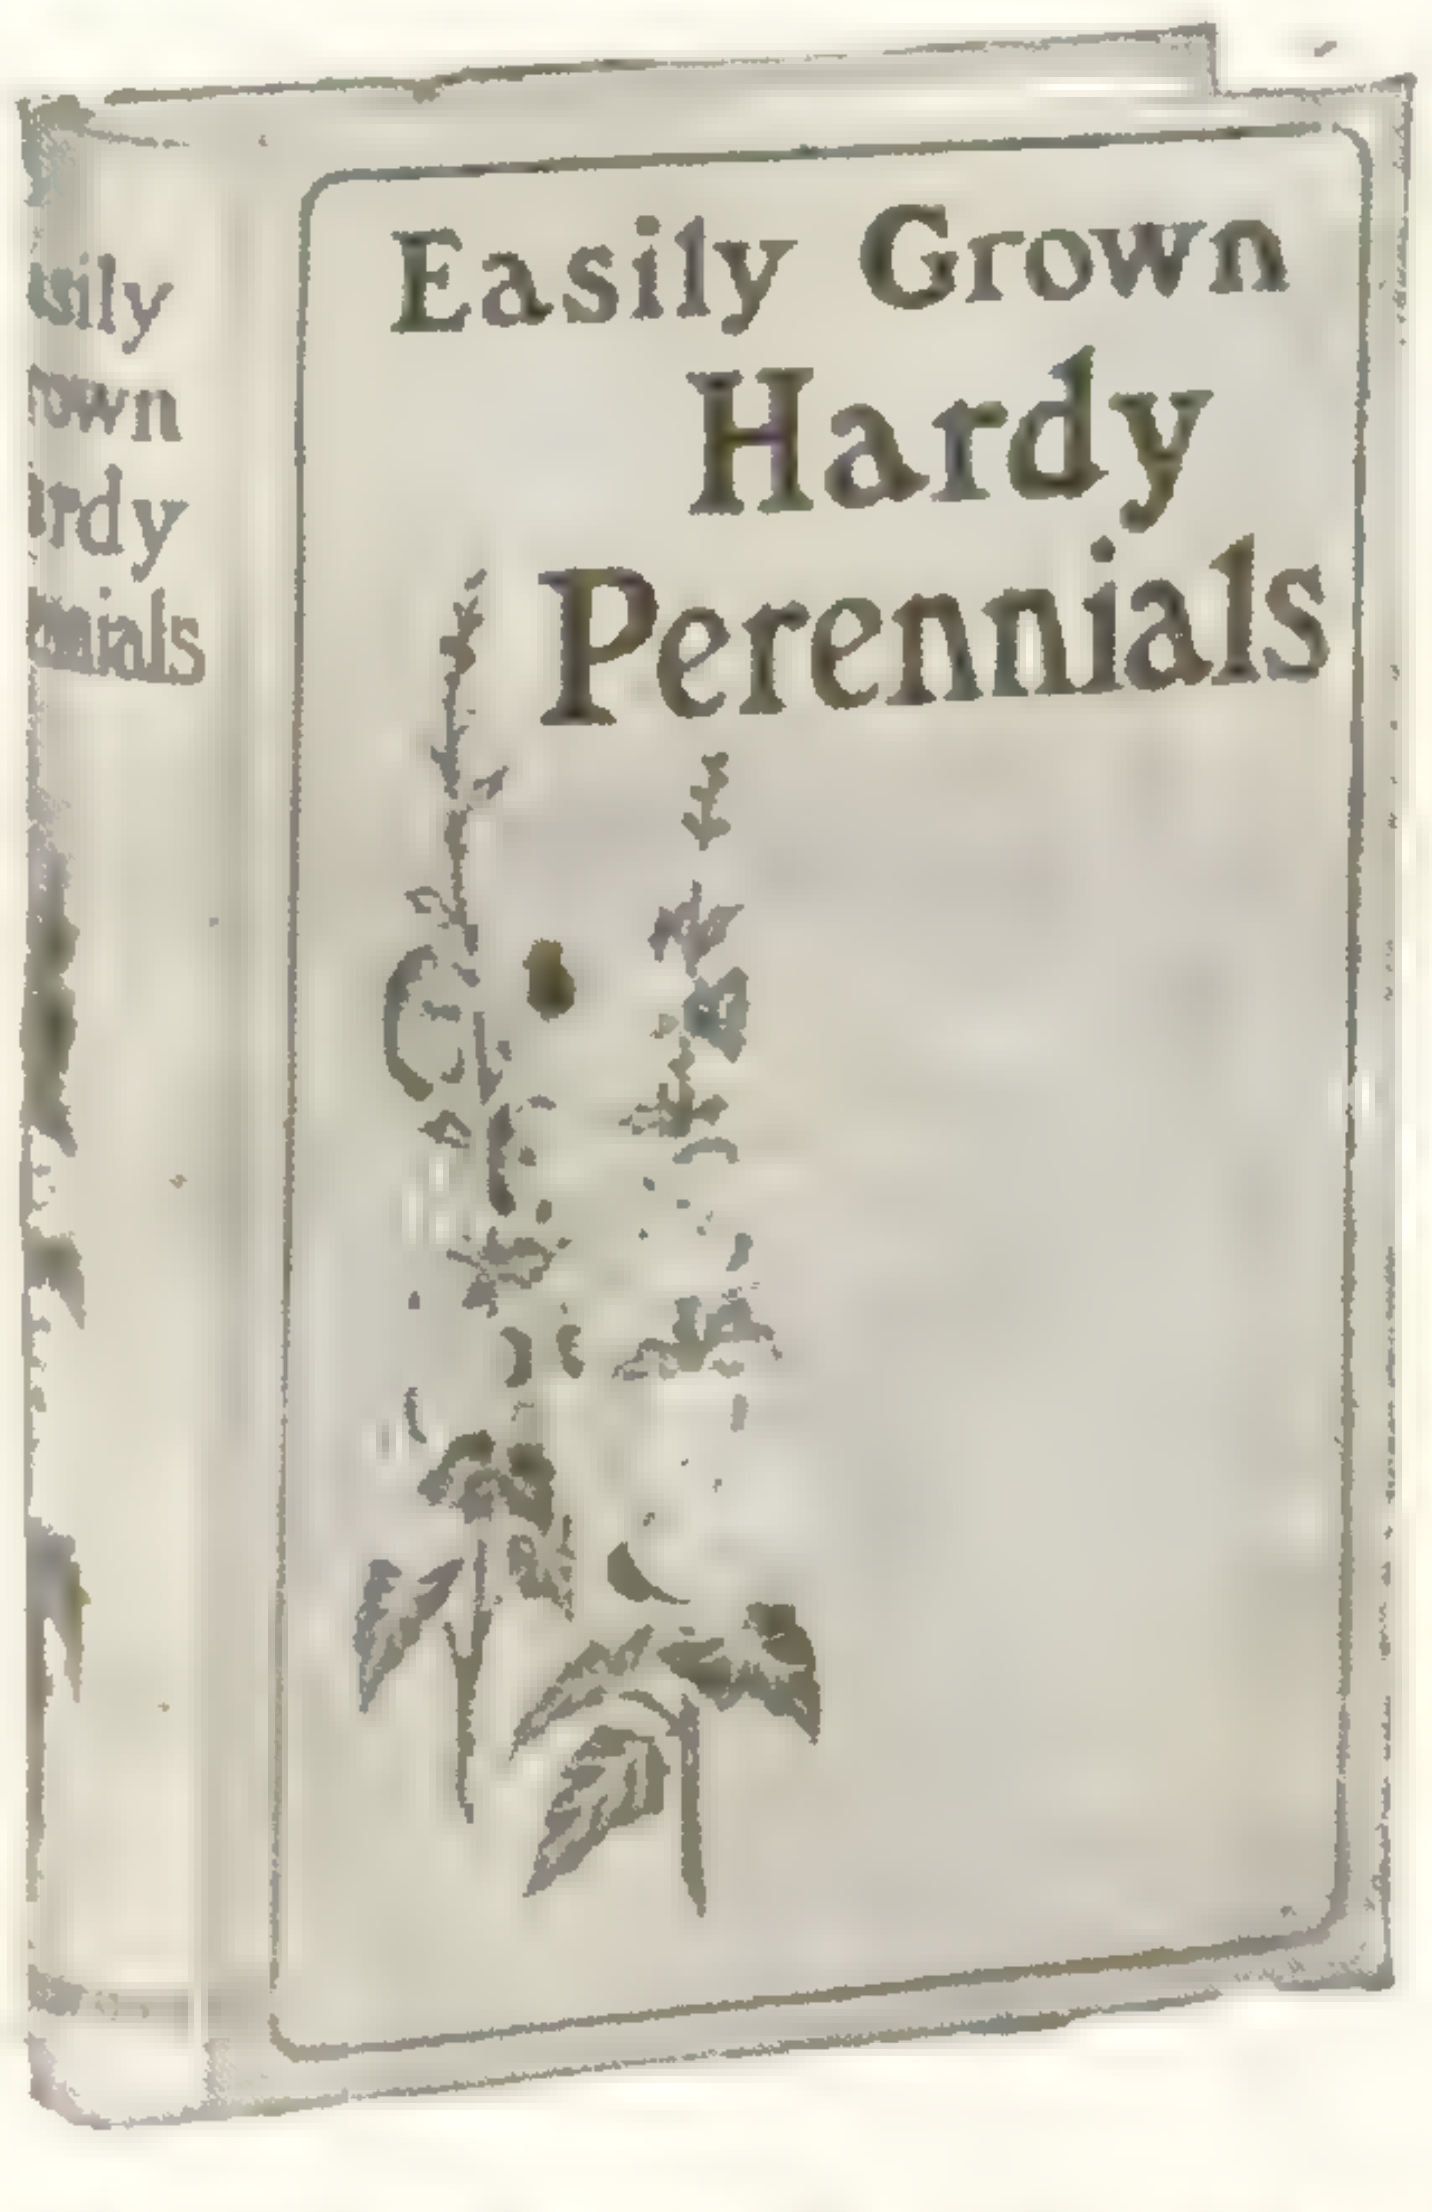
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth.

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.—Gives the botanical or generic name of each genus of plant described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

EXHIBITIONS AND MEETINGS.

◆

Sheffield.

The annual exhibition of the Sheffield Society was held, as usual, in the Corn Exchange, and the dates were November 11 and 12. The big building was fairly well filled with exhibits, and cut flowers were very much in the ascendant. Groups and plants were conspicuous by their absence, but displays and trade groups made a good setting as arranged against the side wall and at the entrance end. The previous evening was extremely wet and windy, and the opening morning was unpleasant. Mr. C. Cook continues to fill the duties of secretary in an able manner, and he is well supported by a hard-working set of committee men and stewards who do not shirk their part of preliminary and tedious duties on the show morning.

Some alteration of the arrangements for judging seem necessary. The schedule states that the show will be open to the private view of patrons and subscribers from 1 to 2 p.m., to the public from 2 p.m. onwards, but judging was not nearly finished by 2 p.m.

At Sheffield one always sees the beautiful old incurved varieties of the Rundle family shown well, and on this occasion the artisans showed no fewer than fourteen stands of six blooms each.

CUT FLOWERS.

The leading cut flower class was for three dozen Japanese chrysanthemums, in not less than twenty varieties, arranged on boards, and here the premier award was the handsome Broomhead Memorial Shield (held for the year only) £6, and a medal. There were three entries, and the best of these was from Mr. G. W. Drake, Cardiff, who scored 97½ points, with good blooms of the following varieties: Lady Talbot, W. Gee, F. S. Vallis, President Viger, Chrys. Montigny, Mrs. G. Milcham, Marquis of Northampton, J. W. Molyneux, J. H. Doyle, J. Lock, Valerie Greenham, Madame Paolo Radaelli, Reginald Vallis, Maud Jefferies, Rose Pockett, Leslie Morrison, W. A. Etherington, O. H. Broomhead, Bessie Godfrey, J. H. Doyle, Pockett's Crimson, Gladys Blackburn, Master James, Walter Jinks, and J. H. Silsbury; the second prize fell to Mr. W. Iggulden, Lock's Hill Nurseries, Frome, who totalled 88¼ points; Mr. W. C. Hyde, Pitsmore, Sheffield, third.

Next in order of importance came the class for six vases of Japanese blooms, three blooms of one variety in each vase. There were three competitors again, and first prize was awarded to Mr. C. Jennings, Aston Hall, North Ferriby, who had grand flowers of Mrs. A. T. Miller, Master James, Mrs. L. Thorne, Marquis Visconti Venosta, Reginald Vallis, and Lady Talbot; the second prize went to Mr. W. Iggulden; and third to Mr. W. Drake.

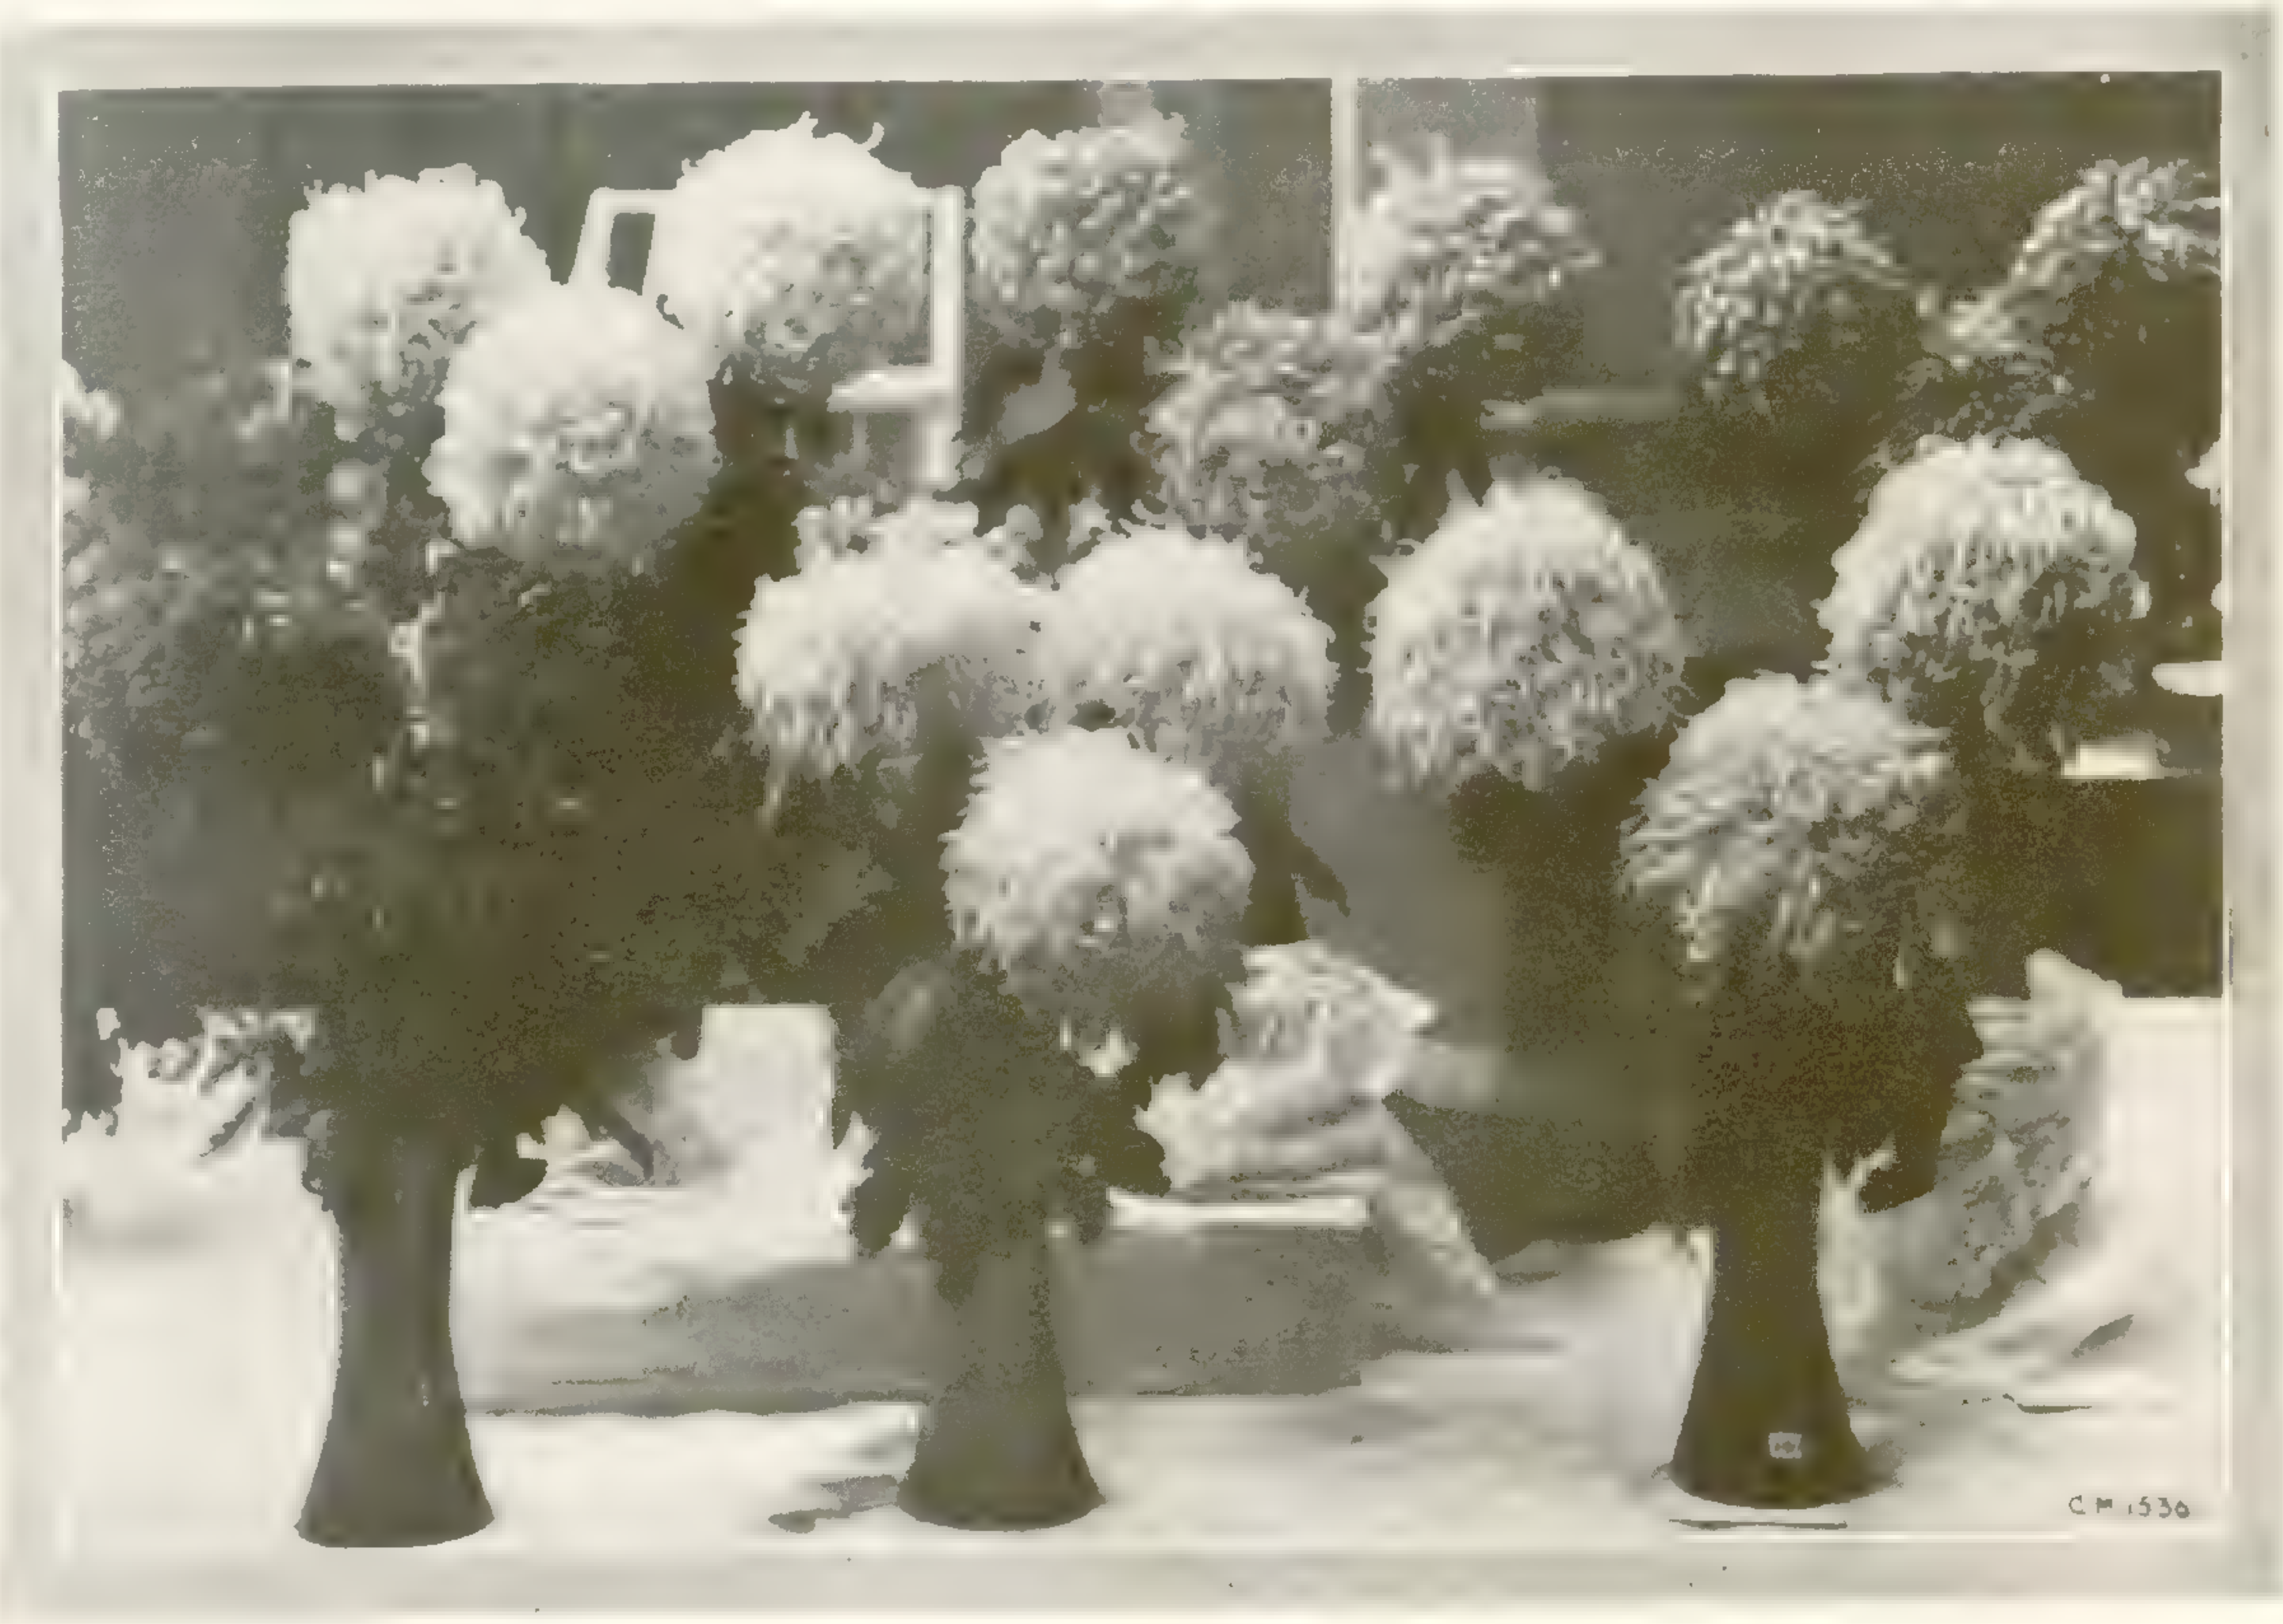
Mr. Drake led for six vases of incurved blooms with finely finished examples of G. F. Evans, C. H. Curtis, Bocace, G. W. Matthews, Mrs. F. Judson, and Miss N. Threlfall; Mr. C. Jennings, second, and Mr. J. Harrison, Walkley, third; three entries. The best two vases of incurved were from Mr. Drake, who was followed by Mr. C. Jennings and Mr. J. Harrison, as placed. Mr. Jennings led for a vase of white chrysanthemums with Mrs. A. T. Miller; Mr. Drake second, and Mr. Spencer, gardener to Mrs. Roberts, Park Grange, Sheffield, third.

Mr. H. Woolman, Shirley, secured the premier award for a display of single chrysanthemums, arranged on a space 12ft. by 5ft., and he won with a very fine display of good blooms, well set up in stands and vases of various sizes, some of the best being Felix. [illegible], E. Pagram, Sylvia Slade, Altrincham Yellow, Stella, and J. L. Tredwell; Messrs. Seagrave and Co. came second, and Mr. W. E. Hyde third, and all showed well, the class proving a considerable attraction.

Mr. Iggulden staged the best vase of a yellow Japanese variety, staging Mrs. W. Iggulden finely; Mr. Drake second, and Mr. Jennings third.

There were several entries in the class for a display of chrysanthemums arranged for effect on a table space 6ft. by 3ft., and here Mr. James Harrison came to the front with an exhibit of fair-sized flowers, representing Japanese, incurved, and single varieties, all well arranged; Mr. W. Rednall, gardener to J. Milner, Esq., Sharrow, came second; Mr. C. Hyde, third; and Mr. Ayan, gardener to S. Roberts, Esq., Sheffield, fourth.

In the district class for four vases of Japanese chrysanthemums, three blooms of one variety in each, Mr. W. Fletcher, Mr. J. Harrison, and Mr. C. Fletcher secured the awards in order as placed. For two vases of Japanese blooms the awards fell to Mr. W. Spencer, Mr. W. Fletcher, and Mr. J. Harrison, as placed. In this division the class for six vases of single chrysanthemums was a very good one, and premier award fell to Mr. D. Lewis for particularly beautiful flowers of Master Lour, White Chief, Cream King, Edward Lewtas, Seagull, and Ajax; Mr. W. Spencer, second; and Mr. W. Hartley, Barnsley, third.



FIRST PRIZE SIX VASES OF JAPANESE BLOOMS AT SHEFFIELD.
Exhibited by Mr. C. Jennings, Aston Hall, North Ferriby.

In the amateurs' and cottagers' section there were hosts of flowers, and many of these were of good quality. In most of the classes there were six prizes given. Mr. W. Fetcher and Mr. C. Fetcher, both of Stannington; Mr. W. Crawshaw, Woodend View; Mr. W. J. Carnall, Sheffield; Mr. A. Asfurth, Hillsbro'; and Mr. W. Lee were the most successful competitors.

Mr. Spencer scored for a basket of chrysanthemums, while for a dinner table arrangement Mr. Lewis, gardener to W. A. Milner, Esq., Totley Hall, was first prize winner with a bright design in rich bronze-red single varieties; Mr. C. Hyde, second with bronze Source d'Or, and Messrs. Seagrave and Co., third, with deeply coloured flowers of Primula obconica.

PLANTS.

Mr. E. Mills was a good first for six Begonia Gloire de Lorraine, winning with pyramidal specimens that were, in some instances, four feet high; Mr. W. Spencer, gardener to Miss Roberts, second. Six table plants made up a good class, Mr. C. Hyde and Mr. E. Mills coming first and second in a good competition. Mr. Agar led for six specimen ferns with large examples of plumose nephrolepis, pteris, Asplenium bulbiferum, and Adiantum Weigandi; Mr. C. Hyde, second; and Mr. Clapham, Broomhall Park, third. Mr. Hyde was first for two specimen plants with a pair of well-grown palms.

FRUIT AND VEGETABLES.

Mr. C. Hyde was the only exhibitor in the class for a collection of fruit. He was awarded first prize for a collection that consisted of one bunch each of Muscat of Alexandria and Alicante grapes, and dishes of Beurre Bachelier and Doyenne du Comice pears, and Charles Ross and Cox's Orange Pippin apples. There was not a strong competition in the grape classes. For two bunches, black, Mr. W. Evans, Totley Hall Gardens, secured first prize with Gros Colmar; Mr. E. Cotterall, gardener to J. W. Cocker, Esq., Thornsett, Sheffield, second, with Alicante. Mr. C. Hyde was the only exhibitor of white grapes, showing Muscat of Alexandria with shrivelled berries; he was awarded a first prize.

Vegetables were not particularly well shown; Mr. J. E. Davis, Ballathie, Stanley, Perthshire, led in the class for six kinds, prizes offered by Messrs. Sutton and Sons, Reading, and was followed by Mr. C. Hyde, and Mr. Bradley, Totley.

NON-COMPETITIVE.

Messrs. Seagrave and Co., Gleadlees, Sheffield, put up a very large exhibit of cut chrysanthemums, arranged effectively with palms, crotons, bamboos, and ferns. The emergency exit door came in the centre of their display, and over the top of this Messrs. Seagrave arranged pot chrysanthemums, cut flowers, and foliage plants, draping this part of the group with Asparagus Sprengeri. Mr. H. Woolman, Shirley, set up some large vases of popular Japanese and incurved chrysanthemums, and with these displayed smaller vases of the old-fashioned incurved varieties of the Rundle family, as well as modern singles.

The Government of British Columbia contributed a very interesting exhibit of finely coloured fruit, the apples being the great feature, and a particularly fine one; Baldwin, Jonathan, Spitzenberg, Grime's Golden, and King of Tompkin's County were unusually well represented. Messrs. W. Wells and Co., Merstham, showed examples of their White House carnation, and such chrysanthemums as Clara Wells, Mrs. R. A. Witty, Lady Crisp, Shanklin, Marie Loomes, and some beautiful single varieties.

Messrs. Hiram Shaw and Son, Richmond Hill Nurseries, Sheffield, filled one corner of the great hall with a handsome group of floral and other designs, consisting of crosses and vases of chrysanthemums, baskets of orchids and roses, baskets of grapes, etc., etc., set in a groundwork of heaths, ferns, solanums, and other useful plants. In the opposite corner a rather flat group of chrysanthemums and foliage plants was displayed by Mr. E. Haworth, Pitsmoor.

Hitchin.

The Hitchin Chrysanthemum Society held its exhibition in the Town Hall and adjacent gymnasium on November 10. The display was an excellent one, and though there was a falling off in the miscellaneous group class, this seemed to be the only weak spot. Cut flowers were very fine, especially those in vases, while the classes for single and decorative varieties proved particularly attractive. The day was fine, at least until evening, and it is therefore to be hoped that the takings at the door were good. The society deserves far better support than it receives, and it would be a thousand pities if, for lack of financial support, the work of the society should cease.

CUT BLOOMS.

There were five entries in the leading class for six vases of Japanese blooms, three flowers of one variety in a vase, and here the silver challenge cup fell to Mr. J. Jefferies, gardener to J. Balfour, Esq., Moor Hall, Harlow, who scored with grand examples of Lady Talbot, Francis Jolliffe, Mrs. A. T. Miller, Master James, F. S. Vallis, and John Peed. The second prize fell to Mr. T. J. Hartless, gardener to T. Fenwick Harrison, Esq., King's Walden, Bury, who had Mrs. C. H. Totty, Mrs. A. T. Miller, Madame G. Rivol, and Rose Pockett in good form. Mr. J. Coutts, gardener to M. R. Pryor, Esq., Weston Park, Stevenage, came third; and Mr. E. Thayer, gardener to W. Bailey Hawkins, Esq., Stagenhoe Park, Welwyn, fourth.

For four vases of Japanese blooms, three blooms in each, another challenge cup was offered, and this was secured by Mr. R. H. Crockford, gardener to C. Poyntz Stewart, Esq., Chesfield, Stevenage, with fine flowers, unlabelled; Mr. T. C. Sadler, gardener to Mrs. Cotton Browne, Walkers Hall, Stevenage, second; and Mr. H. Harding, gardener to Mrs. Grace Harris, Sele Lodge, Hertford, third. Mr. Hartless scored for a vase of incurved blooms with Emblême Poitevine in grand form; Mr. Sadler second, and Mr. Thayer third. For one vase of a Japanese variety, five flowers, Mr. R. H. Crockford, won first place with Reginald Vallis in fine form; Mr. T. Pateman, gardener to C. A. Cain, Esq., The Mole, Welwyn, second; and Mr. J. Coutts third.

Chief award for a vase of white Japanese variety was won by Mr. Pateman with Mrs. A. T. Miller, Mr. Coutts second, and Mr. Crockford third, each with Mrs. A. T. Miller. Mr. W. G. Willmott, Chiltern Road, Hitchin, had the best vase of any Japanese variety, and showed Mrs. C. Beckett. Premier award for a dozen Japanese chrysanthemums on boards was won by Mr. T. J. Hartless, who scored with fine specimens of Bessie Godfrey, Merchett Beauty, Madame Paolo Radaelli, Pockett's Crimson, Rose Pockett, Mrs C. H. Totty, Mrs. A. T. Miller, Mary Poulton, Algernon Davis Master David, White Queen, and Reginald Vallis; Mr. E. Thayer second, and Mr. Pateman third. Mr. Crockford scored for six Japanese, and was followed in order by Mr. T. C. Sadler, and Mr. H. Harding.

Three vases of single varieties, six sprays of one variety in each vase, proved a most attractive class. There were ten entries, and the winner was Mr H. Bates, gardener to Miss Robertson, Sele Grange; Mr. Orsman second, and Mr. W. Robinson, gardener to F. Ransom, Esq., The Chilterns, third. Equally good was the class for a dozen vases of decorative chrysanthemums staged under similar conditions, and here Mr. Robinson was to the front, followed by Mr. C. Green and Mr. A. Wilson, gardener to A. Ransom, Esq., Baslow, Hitchin.

FLORAL ARRANGEMENTS.

There were several classes for ladies, the chief one being for a table decoration of chrysanthemums. There were nine competitors, and Sister Ernestine, Warren Hee, Hertford, annexed the premier award with a dainty arrangement of the single variety Mary Richardson; Miss E. C. Cooper, Sun Street, Hitchin, a good second, with a design in the same variety; Mrs. Charles Green, Hitchin, third, with yellow flowers; and Miss Armstrong, Fishpond Road, Hitchin, fourth. Baskets of chrysanthemums were very fine, and Sister Ernestine was placed first with a beautiful and bold exhibit of a rich bronze single; Miss A. R. Lucas second, and Mrs. Crockford, Chesfield, Stevenage, third. Sister Ernestine was also first for a vase of any flowers and foliage with scarlet carnations; Mrs. Crockford second, with Lilium speciosum, and Miss A. R. Lucas, Tile House, Hitchin, third.

GROUPS AND PLANTS.

All the chrysanthemum groups at Hitchin were edged and faced with ivy sprays, and this makes an admirable setting. There were two entries in the large group class, and here the secretary, Mr. W. G. P. Clark, York Road, Hitchin, was a comfortable first with a well-arranged display of fine flowers. Mr. E. Orsman, gardener to S. Lucas, Esq., Hitchin, second, with a rather too formal exhibit. There were four groups in the amateur class for a display on a space 6ft. by 3ft. 6in., and here Mr. F. A. Wheeler, gardener to Dr. Foster, Hitchin, led with a pleasing arrangement, followed in order by Mr. Willmott, Elmside, Hitchin, and Mr. S. C. Taylor, Tilehouse Street, Hitchin.

Mr. Hartless had the best three winter-flowering begonias; Mr. R. H. Crockford, second, and Mr. J. Coutts third, and all showed really well. Mr. Hartless was first for three zonal pelargoniums, and Mr. R. H. Crockford was best out of five competitors for one orchid, and he led with Cypripedium insigne. Mr. Hartless led for table plants, and Mr. Pateman was easily first for six cyclamens in a considerable competition. The best three specimen chrysanthemums were huge trained bushes shown by Mr. W. Robinson, Mr. Orsman coming second, and Mr. A. Titmus, gardener to W. Tindall Lucas, Esq., Foxholes, third.

FRUITS.

Mr. C. E. Martin, gardener to Viscount Hampden, The Hoo, Welwyn, led for white grapes. Mr. Pateman and Mr. Hartless were first and second respectively for nine dishes of apples, and each staged a good collection. Mr. Pateman showed the best three dishes of pears, staging good fruits of Pitmaston Duchess, Doyenne du Comice, and Durondeau; Mr. R. Parker, gardener to Major Low, Frogmore Hill, Hertford, third. Mr. Hartless scored for black grapes, with Mr. Hawksworth, gardener to J. Flack, Esq., The Paddock, Stevenage, second. Mr. H. Hardy, gardener to Miss Harris, Sele Lodge, led for a dish of Cox's Orange Pippin apples.

In the amateurs' class for vegetables Mr. E. H. Pateman was first, and the Rev. C. Chalmers Hunt, Willian Rectory, second, for six kinds.

Bradford.

The Bradford Society is to be congratulated upon the continued success that attends its efforts to provide a fine autumn show. The St. George's Hall is an ideal place for an exhibition, except that it is rather small for the number of exhibits brought together. The show always looks well, with the table plants, cyclamen, Roman hyacinths, etc., arranged down the centre of each table between the cut flowers. The larger plants are arranged upon the orchestra, where they produce a very fine effect, but are not get-at-able, while in front of the platform the array of high-class floral designs is set out. Big prizes are offered for cut chrysanthemums, and a splendid competition results.

CUT FLOWERS.

The leading class at Bradford is for two dozen Japanese blooms, in not less than eighteen varieties, the prizes offered being £10, £7, £5, £3, and £2, respectively. The premier award was annexed by Mr. A. Chandler, gardener to Arthur James, Esq., Coton House, Rugby, who showed superb blooms of F. S. Vallis, W. Gee, Purity, Reginald Vallis, J. Peed, G. Hemmings, Lady Talbot, W. Mease, Francis Joliffe, Valerie Greenham, Hon. Mrs. Lopes, Mrs. Charles Penford, Marquise Venosta, President Viger, Bessie Godfrey, J. Lock, J. H. Silsbury, and Master James. Mr. T. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey, came second, and he had grand flowers of Lady Talbot, Mrs. A. T. Bott, F. S. Vallis, Harry Wood, W. A. Etherington, W. Mease, and Rose Pockett. Mr. G. H. Drake, Cathays Terrace, Cardiff, came third; Mr. W. Iggulden, Lock's Hill Nurseries, Frome, fourth; and Mr. Charles Jones, Abergele, North Wales, fifth. Six competitors.

For a dozen Japanese blooms, distinct, Mr. Thomas Stevenson secured the chief award with big specimens of Lady Talbot, O. H. Broomhead, Duchess of Sutherland, W. Jinks, Maud Jefferies, Edith Jamieson, F. S. Vallis, Reginald Vallis, W. Rawlins, W. Mease, Hon. Mrs. Lopes, and Purity. Mr. A. Chandler had here to take second place, and Mr. Iggulden was third.

Twenty-four incurved blooms, in not less than eighteen varieties, was a class that brought out three competitors, and here Mr. G. W. Drake was to the front, securing the £7 prize with big bold specimens of G. W. Matthews, W. Biddle, C. F. Evans (of this he appeared to have three flowers), Pantia Ralli, Bocace, Mrs. F. Judson, Emblême Poitevine, M. Muelanare, Mrs. G. Denvers, Lady Isabel, Mrs. J. Agate, Clara Wells, Nellie Threlfall, and Doris Rayner. Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, was a capital second; and Messrs. H. Clark and Sons, Rodley, near Leeds, were third. The best dozen incurved blooms were those shown by Mr. W. Mease, whose varieties were Clara Wells, Edwin Thorp, C. H. Curtis, Buttercup, Triomphe de Montbrun, Mr. J. Wynne, Mrs. G. Denyer, Mrs. J. P. Bryce, Lady Isabel, W. Pascoe, Emblême Poitevine, and Mrs. H. J. Jones; Mr. G. W. Drake was second.

Twelve bunches of singles proved an attractive class, and premier award was won by Mr. J. Thornton, Lumb Hall Nurseries, Drighlington, whose varieties were Altrincham Yellow, Crown Jewel, Edith Pagram, G. W. Parkinson, May Anderson, Mary Richardson, Rosie Belle, Kitty Bourne, White Pagram, Felix, Queen Alexandra, and Ronald Ferguson; Messrs. H. Clark and Sons, Rodley, came second; and Mr. W. Moorby, Rhodes Street, Shipley, third.

For six vases of Japanese blooms, three blooms in a vase, Mr. A. Chandler won first prize with splendid examples of F. S. Vallis, J. H. Silsbury, Reginald Vallis, Lady Talbot, Mrs. G. Mileham, and Algernon Davis; Mr. W. Iggulden was second; and Mr. C. Jones, Abergele, third.

The chief of the local cut bloom classes was one for eighteen blooms, distinct; there were six competitors, and first prize was won by Messrs. H. Clark and Son; Mr. J. Thornton second, and Mr. H. Foster, St. Ives, Bingley, third. For six Japanese Messrs. H. Clark and Son led, followed by Mr. J. Thornton, and Mr. R. C. Jones, gardener to J. M. Kitson, Esq., Highfield, Branley, third. Mr. J. Thornton scored for a dozen incurved, with Messrs. H. Clark and Son second, and Mr. T. Bird, Valley Street, Windhill, third. Mr. J. Thornton, Mr. E. T. Smith, Mr. W. Aldridge, gardener to Mrs. Constable, Manor House, Otley; Messrs. H. Clark and Son, and Mr. J. W. Bries, Ivy Bank Cottage, Halifax; and Mr. A. Rowling, Cottingley, were the other leading prizewinners.

Carnations were very good, and in the class for six vases Mr. W. Iggulden led the way with handsome flowers. Mr. A. Chandler coming second, and Mr. F. Howland, Rawdon, third.

GROUPS AND PLANTS.

An interesting class is the local one for a group of eighteen chrysanthemums, shown in six vases, and set amid plants and foliage in a tasteful manner on a space 6ft. by 3ft. The silver cup, given by the Lord Mayor of Bradford, is the premier award, and this was won by Mr. L. Shearman, Undercliffe Cemetery, with good flowers, associated with crotons, asparagus, etc. Mr. W. Baldwin, New Laithes, Horsforth, second; and Mr. W. Robinson, gardener to C. B. Shaw, Esq., J.P., Shipley Grange, third; seven entries.

Mr. G. W. Dunsmore, gardener to J. Hill, Esq., Throstle's Nest, Allerton, led for six pots of Roman hyacinths, with excellent material, while Mr. A. E. Brown, gardener to C. Beverley, Esq., Farsley, was equally successful with six pots of lily of the valley.

FLORAL DECORATIONS AND FRUIT.

Floral decorations are always a feature at Bradford, and on this occasion the display in this section of the show was as good as ever. Mr. J. Brooke, Market Hall, Bradford, scored for a bouquet of roses, with Mr. M. Brooke North Parade, Bradford, second. Mr. J. Brooke led for a bouquet of carnations with pink flowers; Mr. M. Brooke, second. The premier bouquet of orchids was a charming design in oncidiums, cattleyas, odontoglossums, and a few cypripediums, by Mr. J. Brooke, Mr. M. Brooke following closely. These two close competitors reversed positions, however, in the class for a bride's bouquet, Mr. M. Brooke using white orchids and lily of the valley.

Mr. Midgley, gardener to R. J. Foster, Esq., Queensberry, had the best basket of chrysanthemums in one class, and Mr. R. Field, Eldwick, the first prize in another class. Mr. M. Brooke scored for a bouquet of chrysanthemums, but this looked a very limp affair late in the evening, when we saw it; Mr. Midgley second.

Mr. E. T. Smith, Bankfield, led for a pair of bunches of white grapes; Mr. F. Howland second, and Mr. J. Backhouse, gardener to J. N. Ambler, Esq., Heaton Mount, third; five competitors. There were eight entries in the class for a pair of bunches of black grapes, and here Mr. A. Kirk, gardener to W. Brown, Esq., Swinsby, was first with giant clusters of Barbarossa; Mr. E. T. Smith, second, and Mr. M. Midgley, third.

NON-COMPETITIVE.

Mr. J. Brooke, Market Hall, had a pretty display of floral designs and choice pot plants. Messrs. A. J. Keeling and Sons, Bradford, showed a small, but very attractive group of cypripediums, in which choice C. insigne varieties were greatly in evidence. Some very fine floral designs were staged in a large group by Mr. M. Brooke, North Parade, and these added greatly to the general effect of the show. The British Columbian Government filled a small side hall with a splendid contribution of fine, bright, and clean apples, many of them of popular varieties; this proved a most attractive exhibit. We also noticed that some friends had a stall of flowers, and offered buttonholes, etc., for sale on behalf of the Royal Gardeners' Orphan Fund.

Southampton.

NOVEMBER 8 and 9.

In the Artillery Drill Hall the annual autumn exhibition was held, and was quite the best of recent years. Cut blooms were the most prominent portion of the display, as they usually are here, being numerous and of high quality. Fruit and vegetables were conspicuous features. The arrangements were of the usual high order of merit in the experienced hands of Mr. C. S. Fuidge, who has held the post of secretary now for thirty-six years.

CUT BLOOMS.

In the section for flowers shown in vases, the leading class was for twelve Japanese varieties, three blooms of each, and there were six competitors. The winner was Mr. W. Baxter, gardener to Captain F. J. Dalgety, Lockerley Hall, Romsey, who had specimens of the following in high-class condition: Mdme. P. Radaelli and its yellow sport Mdme. G. Rivol, W. A. Etherington, Edith Smith, Lady Talbot (extra fine), W. Rawlings (a trifle coarse), Purity, Master James (rich colour), Hon. Mrs. Lopes, Reginald Vallis, F. S. Vallis, and Mrs. Norman Davis. Mr. T. Stevenson, gardener to E. G. Mocatta, Woburn Place, Addlestone, Surrey, was a good second, Valerie Greenham, Bessie Godfrey, F. S. Vallis, and Lady Talbot were noteworthy; Mr. F. Chandler, 75, Shirley Road, Southampton, third

For six Japanese, any two white-flowering varieties, three blooms of each, there were three competitors. Mr. Chandler won with fine specimens of Purity and Annie Nichol; Mr. W. Hall, gardener to Major Chichester, Embley Park, Romsey, second. In a class for any two other than white, three blooms of each, Mr. Chandler again led amongst four with F. Payne, and F. S. Vallis, really fine blooms they were; Mr. Baxter second with F. S. Vallis and Master James.

Single-flowered varieties receive their due share of attention here. For six, distinct varieties, disbudded, there were nine entrants, making a charming display. Mr. Stevenson won with a remarkable exhibit: the varieties were Marsa, white; Pictor, soft pink; Bronze Pagram, Metta, Forbes Pink, and Framfield Beauty; Mr. C. Dymott, Freemantle Nurseries, second, staging well also. In a similar class, without disbudding, nine took part. Mr. C. Dymott here led with extremely well-flowered examples of Mary Richardson, Laura Hearne, Lily Beer, Edith Pagram, Merstham Beauty, and Peter Pan; Mr. Stevenson second with a good set also.

What are known as decorative chrysanthemums, in addition to singles, are here remarkably well shown. In the class for four varieties there were eleven competitors, and Mr. Chandler was awarded the first prize for small blooms of such forms as Alice Byron, Lady Talbot, O. H. Bromhead, and W. Gee, which hardly represented the inference in the schedule. The second prize exhibit, from Mr. Dymott, was more in accordance with the spirit of the schedule, being really market-grown blooms of such varieties as Market Red, Hortus Tolosanus, Mdlle. Dorey, and the Rev. W. Wright.

The blooms in the following classes were to be shown on boards: In the class for twenty-four Japanese, in not less than sixteen varieties, six entered, and Mr. Baxter again led with a level lot of high-class blooms well displayed; F. S. Vallis, W. Mease, Mrs. G. Hemming, Bessie Godfrey, and Lady Talbot were noteworthy; Mr. Stevenson followed closely with a set containing many excellent blooms; Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Moreton House, Kingsworthy, Winchester, third.

Incurved varieties were numerous and good. For eighteen, in not less than twelve varieties, there were five competitors. Mr. A. J. Marsh here received the premier award for a set of large, rather rough examples that were not too fresh. Romance, Godfrey's Eclipse, Clara Wells, and Frank Trestian were the best. To Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, was given the second prize, who, in the opinion of many, should have been first. The blooms were not large, but they possessed high quality, and were well finished and fresh. Clara Wells was especially fine, being selected as the premier incurved bloom in the show; Lady Talbot in Mr. Stevenson's second prize vase class was adjudged the

A MAGNIFICENT COLLECTION OF CHRYSANTHEMUMS.
Exhibited by Mr. Norman Davis at the National Chrysanthemum Society's Great Show, and awarded the Special Gold Medal offered by Messrs. Clay and Son for the best exhibit.

premier Japanese bloom. Amateurs showed really well in the various classes provided for them.

PLANTS.

Plants were not numerous, but well developed. For a group of chrysanthemums and foliage plants arranged for effect in a space twelve feet by eight feet, there were three entries. Mr. T. Hall, gardener to Lord Swaythling, South Stoneham House, Southampton, was first with good single-flowered varieties and desirable foliage plants; Mr. F. G. Bealing, Bassett Nurseries, Southampton, second. Bush plants were really well grown, being large and profusely flowered, the best four coming from Mr. C. Hosey, gardener to J. C. D. Esterre, Esq., Edenfield, Southampton; Mr. C. Dymott second. Mr. Hosey was also premier prize taker in the class for six plants, distinct, to carry not less than five blooms each, staging F. S. Vallis and Alice Byron in good condition.

Table plants were a strong feature, and in the class for six, eight competed. Mr. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was first with a charming set.

FRUIT AND VEGETABLES.

Fruit was a distinct feature. Mr. W. Hall won for three bunches of grapes. Mr. Baxter had the best white grapes, Muscat of Alexandria, really first-class. Vegetables were a strong feature, Mr. Ellwood winning the leading prize in Messrs. Sutton and Sons' class for six distinct kinds; and also in Messrs. Toogood's class for the same number of kinds. In both instances he staged extra good leeks, cauliflowers, onions, celery, and tomatoes.

MISCELLANEOUS.

Non-competitive exhibits were numerous and good. Messrs. Oakley and Watling had a fine exhibit of floral work, which was much admired. Messrs. B. Ladhams and Co. had hardy plants in good array. Mr. E. Wills, Winchester Road Nurseries, Southampton, contributed floral designs, bouquets, etc., amongst which were crosses and wreaths composed of laurel leaves, quite a feature. The British Columbian Fruit Company had a splendid exhibit of apples, and bottled fruit. Messrs. F. Hillier and Son, Winchester, had fine apples.

Weston-super-Mare.

NOVEMBER 10.

For the twenty-fifth year Weston show added to its record in entries if it did not in attendance, but this no doubt would have been larger had the weather only continued its promise of the early morning. The exhibition itself was a fine one, and in almost every instance the competition was keen, and exhibitors, inspired, no doubt, by the tactful enthusiasm of the secretary, Mr. John Lee, who is the most popular man in Weston on show day.

CUT BLOOMS.

These made a fine display, and the quality was of the best. A local exhibitor, Mr. Cook, gardener to H. Cornelius, Esq., excelled in the class for twenty-four varieties with a stand of exceptional blooms, though the casual observer scarcely comprehended the point which separated the two leaders. The best flowers were Splendour, Edith Smith, Rose Pockett, Leslie Morrison, Mrs. Knox, Maud Jeffries, and Lady Talbot. Mr. Iggulden, Lock's Hill, Frome, took the second award, having several conspicuously new sorts, among them Mrs. R. Brown, Alice Lemon, Mrs. W. H. Lewis, Ellie Green, Mrs. Iggulden, and F. Payne; third prize went to Mr. Harding, gardener to Colonel Colfax, Bridport, who staged Thomas Stevenson, and Mrs. Chas. Penford in good form. With twelve varieties Mr. Daffurn, gardener to Mrs. J. R. Murray, won from Mr. F. Tyler, Clevedon, and Mr. W. C. Perry; Mrs. Coster, Master James, and Pockett's Surprise were notable flowers.

Mr. Iggulden championed the class for six vases three blooms each, with magnificent blooms of F. S. Vallis, W. Jinks, Hon. Mrs. Lopes, Mad. Rivol, J. H. Silsbury, and Madame Radaelli. Mr. Sutton, Portishead, came next with Mrs. Knox, Pockett's Crimson, and A. T. Miller as his best. Mr. Iggulden and Mr. Hancock shared first prize for three of white and yellow flowers.

GROUPS, ETC.

Groups were good, both of large-flowered and single varieties, the latter making a new class. Messrs. Cook, Henby, and Brooks and Son were the prize winners in the first named. Mr. C. J. Ellis, Weston Nursery, was an easy first for singles, with some varieties of his own raising, notably W. Buckingham (F.C.C.) and C. J. Ellis, reputably good lasting flowers. He also scored easily for the bank of miscellaneous foliage and flowers. There were keen contests in other classes for plants, varying in size and character.

Decorative exhibits are always choice at Weston, and the well-lighted hall showed them to the best advantage. In a central position these artistic schemes in flower and foliage were pleasingly prominent. Baskets of autumn foliage were excellent.

Fruit—apples, pears, and grapes—won high opinions for the uniformly high quality all through, and the competition was both keen and full. Mr. Wilkinson, Tyntesfield, had the finest Muscats and Alicantes, and dessert pears in two classes; Mr. Curtis, gardener to Sir W. Howell Davis, M.P., also being a prominent exhibitor. Mr. J. H. Virgo, a veteran in apple culture, won in both dessert and culinary classes, four dishes each, with unmistakably good fruit. Mr. Wilkinson, with wall-grown Peasgood's outstripped several other notable growers for a single dish of apples. James Grieve, from Mr. Lane, a local grower, was the finest dish we have seen of this choice dessert apple.

Vegetables in collections and single dishes were splendid, Mr. Curry, Worle, and Mr. Shephard, Bridgwater, being notable winners.

The trade exhibits gaining gold medal awards were those from Messrs. C. J. Ellis and W. Brooks and Son, both well-known local representatives.

Dundee Horticultural Association.

This association met on the 10th inst., under the presidency of Mr. Wm. Christeson, when an interesting and instructive lecture on "Malmaison and Winter-flowering Carnations" was delivered by Mr. W. M. MacDonald, head gardener, Mount Melville, Fifeshire. Without going into wearisome detail in regard to the obscure history and hybridising of the Malmaison type, the lecturer gave a lucid and comprehensive account of his own methods of cultivation as practised with gratifying results in various parts of the country. "Perfection" was the "goal" aimed at, and this Mr. MacDonald constantly kept in view as he directed the attention of his audience to the various details, from the layering of the growths to the flowered specimens of two years old. After reaching this age he did not think it desirable to keep them, as the quality of the blooms and the appearance of the plants deteriorated. Overwatering and coddling (mistaken kindness) were, he considered, the primary causes of failure and disease, which could easily be averted were attention paid to the real requirements of the plants. This, Mr. MacDonald attributed the key-note of success. In referring briefly to the varieties of Malmaisons, the lecturer appraised Princess of Wales and Duchess of Westminster for their refined flowers. Winter-flowering carnations evidently stood very high in the lecturer's opinion: while he regretted the fact that they were not so much grown in the north as was the case in the south. As far as he could judge, his collection was as good at present as any he had charge of in the south or west. There was one thing he was confident of, and that was, they could not be grown entirely in the open in this district during the summer months, as was the practice in many places in the south. His practice was to strike the cuttings as procurable from October to February, pinching as often as possible before the end of June to ensure a bushy growth; 5 or 6-inch pots were quite large enough for the final shift to bloom the first year, but he strongly advised growing some of them on a second year. In response to the request of a member, Mr. MacDonald recommended the following varieties as the best in his collection: Aurora, Britannia, Duchess of Portland, Fair Maid, Enchantress, Harlowarden, Floriana, Jessica, Mikado, Mrs. Thos. W. Lawson, Nelson Fisher, Robert Craig, Rose Enchantress, White Enchantress, White Lawson, White Perfection, Winona, and Uriah Pike. A profitable discussion ensued, the following members taking an active part: Messrs. Slater, Grant, Birse, Butchart, Campbell, Croll, and Bethel. The latter remarking that "he had the privilege of seeing Mr. MacDonald's collection a week previously, and was convinced that the lecturer practised what he preached."

Derby.

The Derbyshire Gardeners' Association's Chrysanthemum Exhibition, held at the Drill Hall, on November 4 and 5, was decidedly the largest seen there for years. The entries were numerous, and the quality of the exhibits quite up to the mark. The exhibition was formally opened by the Countess of Kerry; the Rev. Henry Buckston presided, and amongst those who took part in the ceremony were: Sir Thomas Roe, M.P., Sir Edwin Ann, Mr. H. H. Raphael, M.P., and Alderman T. Fletcher. It was, however, discouraging to see such a scanty muster of visitors present.

For twenty-four Japanese blooms there were six competitors, and Mr. R. Nesbit, gardener to Sir W. Bass, secured the first honours, his stand consisting of F. S. Vallis, Reginald Vallis, Mrs. H. B. Marsham, President Viger, Francis Jolliffe, W. Gee, White Queen, Mr. L. Thorn, J. W. Molyneux, Mrs. A. T. Miller, G. Hemmings, Hon. Mrs. Lopes, Mr. R. Luxford, Marquis Venosta, Dennis Kirby, Evangeline, and Lady Conyers. The bloom of J. W. Molyneux was of the most striking colour. Mr. A. Chandler, Rugby, followed closely, his F. S. Vallis being the finest bloom in the show; Mr. J. Wood, Alvaston, third.

Of twenty-four incurved, there were four entries. Mr. Nesbit led with Romance, F. Tristian, H. W. Thorpe, Pantia Ralli, Marjorie Shields, Buttercup, Mrs. Hygate, W. J. Higgs, Lady Isabel, Boccace, Mdme. de Vernenuel, Mdme. Vrembley, Mrs. G. Denyer, Daisy Southern, and Calypso; Mr. A. Chandler second, and Mr. J. Wood third. For six vases of Japanese, the winners ran in the same order.

Six competed for the table decoration. Mrs. F. Orton, Longford, first, Mrs. Warwick second, and Mrs. Flint third. For a group of chrysanthemums Mr. F. Meakin led, Mr. C. T. Chadwick was second, and Mr. G. Potter third. The first prize in another group class was won by C. S. Buck. There was keen competition in the less important classes.

Non-competitive exhibits were a great feature of the show. Mr. F. Sherwin, gardener to Captain W. Drury-Lowe, Locko Park, had a superb display of begonias; and Mr. Shambrook, gardener to the Rev. H. Buckston, sent a collection of begonias, orchids, cyclamen, and chrysanthemums, which was much admired. Mr. Coley, The Outwoods, Duffield, had three very fine specimen seedling single chrysanthemums, which attracted the attention of the visitors, these were named respectively Elsie Robinson, a bright pink with a white eye; C. Knifton, white, flushed orange; and J. H. Coley, a waxy white.

Vegetables were abundant, and there were twenty entries for collections, the winner being Mr. H. C. Smith, Alvaston.

Praise is due to Mr. W. Garton, the secretary, for the very able manner in which the arrangements were carried out.

Royal Horticultural Society of Aberdeen.

ANNUAL MEETING.

The annual meeting of the members of this society was held in the Music Hall Buildings, Aberdeen, on Saturday evening, 5th inst., Mr. J. G. Burnett, of Powis, in the chair. There was a very large attendance. In moving the adoption of the annual report and accounts of the society for the past year, the Chairman said they might regard them as very favourable. Their show was one of the best ever held under the auspices of the society. That was the opinion of the judges who were present. After all, it was upon the number of exhibitors and the quality of the exhibits that they as a horticultural society had to depend. Only when their show was successful could they be considered to be doing the real work of promoting horticulture. In the matter of finances the society had every cause to be thankful for the results. They began the year with a deficit, but now they were able to go on with a certain balance towards the expenses of next year. The balance was not a very large one, but still, the fact that they had been able to wipe out something like £34 of a debt during the year was a sincere cause for gratification. He was sure that on the second day of the show the hearts of a great many of the directors must have been very heavy on account of the weather. Fortunately there was a change on the Saturday, the rain cleared off, and as a result the whole gate realised £324, an increase of something like £80 on the previous year. While they were very glad of these facts, there was one thing which he thought did not give the same cause for gratification. The directors wished to take this opportunity of appealing to them to endeavour to help to increase the membership of the society. The working expenses of the society during the past year were £434, and he thought that was about the smallest expenditure possible if they were to have a really good show. When the income side of the accounts was looked at, it would be seen that the one source of income on which they could depend—subscriptions and donations—only amounted to about £100, or less than a quarter of the expense to which they had to go in holding their annual show. He thought this should give cause for reflection to all who were friends of the society. Mr. George Alexander, Aberdeen, seconded, and the report and accounts were unanimously adopted.

Mr. Burnett then moved the re-election of the honorary president—the Lord Provost of Aberdeen—the honorary vice-presidents, and the honorary directors, and his motion was adopted. The Chairman said that during the past four years he had had the honour of holding the post of chairman. He was very proud to have had the confidence of the directors for so long a period. After four years he felt there ought to be a change—that someone else ought to be appointed in his place. He did not think it was good to have the same chairman for long, and he was further strengthened in this opinion by the likelihood that at the time of the next show of the society he would not in all probability be at home, and he thought the chairman, if at all possible, should always be at the show. It was with regret, indeed, that he severed his official connection with the society, and with the directors. That connection had always been most pleasant. He had to thank Mr. Rennett, the secretary, for the valuable help he had given him. He had the name of a gentleman to propose for the post of chairman—one who, he felt sure, would be in every way suitable for the post. He referred to Mr. W. S. Gill, of Dalhebity, who was a public-spirited citizen, and one who took a great interest in horticulture. Although Mr. Gill was unable to be present that night, he had written saying he would be pleased to accept the post. Mr. Gill's election was made unanimously and with great cordiality.

Mr. Robson (Messrs. W. Smith and Son, seedsmen, Aberdeen) felt sure they would not allow their present chairman to depart, after his four years' service to the society, without giving some definite expression of their gratitude for his most excellent service. Mr. Burnett had done all in his power to promote the interests of horticulture. Their venerable society was now 86 years old, and during that time the chair had been occupied by a great many very distinguished citizens of Aberdeen, but he believed he was expressing the opinion of all present when he stated that they had not in all that time had a more zealous or more efficient chairman than Mr. Burnett, of Powis. (Prolonged applause.) Mr. Burnett had kept the chair with unanimous approval for four years, which was an unusually long tenure of office. He moved that a special vote of thinks be accorded to the retiring chairman for the great interest he had shown in the affairs of the society during his four years of office. (Loud applause.) Mr. Burnett returned his thanks for their hearty appreciation of his services, and remarked that, although he was giving up the chairmanship, he would still continue to take a warm interest in all that pertained to the welfare of the society.

Ex-Baillie Milne was re-elected vice-chairman; Messrs. W. Reid and W. Wyllie were re-elected auditors; while Mr. J. B. Rennett was most cordially re-elected secretary and treasurer of the society. Twenty acting directors were also elected for the ensuing year, and a ringing, kindly cheer to the chairman closed the proceedings.

Paris International Chrysanthemum Show.

Among the various foreign exhibits staged at this show, special mention should be made of Mr. Engelmann's superb display of carnations. It far excelled anything of the kind set up by French exhibitors, and one of the most famous French lady artists expressed her high appreciation of the arrangement. Messrs. W. Wells and Co., of Merstham, sent a vase of their new carnation White House. Messrs. G. and A. Clark, of Dover, also had a good exhibit.

Great Britain was also well represented on the jury. Mr. Harman Payne was elected president of the first section, and also president of the Floral Committee. Mr. Bevan was appointed president of the third section; Sir Albert Rollit, president of the fourth section; Colonel Prain, president of the seventh section; and Mr. Geo. Schneider, president of the eighth section.

The festivities lasted over three days, and the British representatives were treated in the most hospitable and cordial manner.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, November 8.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Dr. A. B. Rendle, Messrs. A. W. Hill, J. Fraser, C. E. Shea, E. M. Holmes, C. H. Hooper, W. C. Worsdell, and F. J. Chittenden (hon. sec.).

FRUIT OF MUSA VENTRICOSA.—Mr. W. C. Worsdell showed a fruit of a species of musa, probably M. ventricosa, which he had collected in the northern Transvaal, the plants growing in a grove on the edge of the forest just where it joins the high veldt.

POLLEN OF APPLES, ETC.—Mr. C. H. Hooper showed photographs of the pollen of several kinds of fruit trees and bushes.

PROLIFERATED PEARS.—Mr. E. A. Bowles showed, on behalf of Mr. Hooper Pearson, some so-called proliferous pears. This malformation is not uncommon, and is explained by the fact that the fleshy part of the pear is an axial structure, not a part of the ovary. The fruits are merely extensions of the axis without the formation of carpels.

TRIPLE FLOWER OF DENDROBIUM FORMOSUM.—Mr. L. Crawshay made the following report on the flower referred to him from the last meeting: This flower was developed near the apex of an inflorescence bearing normal ones, being about half as large again in all its parts. The normal flowers consist of six perianth segments, the petals much broader than the sepals, two of the latter, together with the labellum and column, being prolonged backwards to form a spur. The spur is complete posteriorily by the cohesion of the posterior margins of the lateral sepals, but is split almost to the apex anteriorily, on account of the corresponding margins of the lateral sepals being free. The abnormal flower showed five sepals and three petals, a double labellum and triple column, the middle third of which being the smallest. It is formed of three flowers, the laterals being set nearly at right angles to the median one. Each lateral flower consisted of two complete sepals, two petals (one on the labellum), and a well-developed spur. Each also accounted for one-third of the column, and bore a normal pollen apparatus. The posterior petal (dotted), showed traces of a dividing line, and represented the two contiguous petals of the lateral flowers, whilst the anterior sepal (lined), similarly represented two lateral sepals. The only evidence of the median flower was in the ovary, and the middle third of the column, which was barren. Instead of the characteristic triangle, the ovary showed an oblong section, and only five placental areas had been differentiated.

Bath, NOVEMBER 9 and 10.

The sixth annual exhibition of the Bath Society, held on the above dates, maintained the high character of its predecessors, and favoured with fine weather, it should have attracted a greater number of visitors on the opening day. The Bath Gardeners' Debating Society's principal officers form the executive of the November show, and right well do they discharge their several duties, and deserve well of the community. Having acquired a considerable number of pottery vases, exhibitors do not need to transport them to the exhibition hall, for they can be hired for a merely nominal sum.

CUT BLOOMS.

All cut blooms are staged in vases without exception, and not only is the staging simple, but the effect is distinctly uniform. In the class for twenty-four blooms, Mr. Parrott, gardener to W. H. Tugwell, Esq., Bath, won the first prize with an even lot, among which were Lady Talbot, Reg. Vallis, Leslie Morrison, J. H. Silsbury, and F. S. Vallis. Mr. Cooter, Marshfield, closely pressed the winner with an exhibit of exceptional merit. Sir F. Crisp, Rose Pockett, W. Mease, Splendour, and Beecham Keeling were good. Colonel Rolleston (Mr. Trimby, gardener), taking third place. Mr. G. W. Tilley, gardener to John Moulton, Esq., The Hall, Bradford, smartly carried off the first prize for twelve blooms, prominent among which was the old Mme. Carnot and F. S. Vallis. Mr. Parrott and Mr. H. Chislett followed. Good entries came in the classes for six yellow and six white. In the first-named class the first prize blooms came from Mr. Lilley, who had an exceptionally fine group of F. S. Vallis. Decorative and single varieties came in goodly numbers and in excellent variety.

PLANTS.

Groups were fewer in number this year, but the quality of the blooms, especially in the first-prize lot, was of high standard. Mr. Robb, Mr. T. R. Murray's gardener, succeeding in winning outright the challenge cup offered with cash prizes. This is his third successive win Mr. Parker, gardener to Dr. Wilson Paton won second place. Mr. Pierce, gardener to W. Wailes, Esq., was the only entrant in the class for a miscellaneous group.

FRUIT AND VEGETABLES.

Apples, pears, and grapes were particularly good, though we missed some familiar names among the prizewinners. Chas. Ross was beautiful, also Cox's, King's, and Rival. Mr. Fishlock brought the best collection of apples, and Mr. W. A. Hick had the best pears. Mr. Cooter sent muscats as fresh as in summer, and really grand Alicantes were staged by Mr. Harding.

Vegetables were equally well represented, and the quality select. Messrs. E. Webb and Sons and Messrs. Sutton and Sons offered special prizes for collections, and in these and the open class for nine varieties, Messrs. Pople, Sparey, Horsell, Evry, and Andrews were prominent winners.

NON-COMPETITIVE.

Trade displays, as usual, occupied much space, giving ample testimony of the great help that is afforded by the trade grower—often with little compensation. Messrs. Cypher and Son had an exquisite assortment of vigorous orchids, comprising cypripediums, oncidiums, cattleyas, and odontoglossums. Messrs. A. A. Walters and Son, had an extensive display of apples in good variety. Mr. W. H. Coles lent tall, graceful palms for the central tables, forming quite a tropical avenue. Messrs. G. Cooling and Son, Mr. Rowland, Mr. Adams, Mr. Chas. Wall, Messrs. Blackmore and Langdon, Mr. J. Milburn, Messrs. W. T. Payne and Son, Mr. J. Carpenter, Messrs. Godfrey and Son, and Messrs. Rich and Co., also sent non-competitive exhibits representing widely varying classes of subjects. Gold and silver medals were the awards made.

Oxford, NOVEMBER 8.

On the above date the Oxfordshire Chrysanthemum and Fruit Society held its forty-eighth annual exhibition in the Town Hall, which proved a fairly good floricultural success. The show was formally opened by Mrs. Daniel, wife of the Provost of Worcester College. Entries were below the average, as several exhibitors have recently left the district. To compensate any loss on that score some "extra" exhibits assisted in making up a very attractive display—notably, an extensive arrangement of chrysanthemums, crotons, palms, ferns, and winter-flowering begonias, etc., forming an elongated semicircular pyramid covering fully 140ft. The design had as a back-centre a noble specimen of Kentia Belmoreana, whose dark green, gracefully-recurving fronds proved a foil to the fully 100 giant blooms; very fine being the examples (three blooms on each plant) of Mrs. Norman Davis, Mrs. A. T. Miller, Master James, Mrs. R. H. B. Marsham, Dorothy Goldsmith, Master David, F. S. Vallis, T. H. Silsbury, Leigh Park Wonder, Magnificent, Miss O. Miller, Reginald Vallis, Mrs. A. H. Lee, Mrs. H. Perkins, and Thomas Stevenson. The group was arranged by Mr. J. S. Chidlow, gardener to Mrs. Herbert Morrell, Headington Hill Hall, who further contributed collections of winter-flowering begonias and zonal pelargoniums, double primulas, and chrysanthemums in vases; a gold medal was awarded. Other "extras" which received honorary awards included a fine show of carnations in pots and vases from Mr. John Johnson, The Nurseries, Garsington, the specimens of the several shades of Enchantress being noticeable; Mr. John Mattock, Rose Nurseries, New Headington, staged a collection of single chrysanthemums, from seed sown in February; and Mr. H. Smart, 32-34, The Market, Oxford, put up a most extensive assortment of English (Oxfordshire-grown) and foreign apples and pears, which formed an interesting show. In the competition the class for four specimen chrysanthemums proved a good one, the premier award going to Mr. S. Mold (foreman cooper), Grandpont, Oxford, for well-grown examples; and in the class for a group on 48 square feet the award fell to Mr. James Holton, gardener to Mrs. Daniel, Worcester College. A very excellent group on 30 square feet space was arranged by Mr. Harry Miles, carrier, New Headington, who scored well in the amateurs' division for blooms, winning the cup for six triplets and two other premiers.

Cut blooms, though fewer than usual, were certainly very good, the silver challenge bowl for nine triplets falling, as last year, to Mr. J. M. Bush, gardener to F. J. Myers, Esq., Charlton Lodge, Banbury, whose colossal examples attracted attention. The varieties were: Marquis of Northampton, Master James, Hon. Mrs. Lopes, Marquis Venosta, Reginald Vallis, Lady Talbot, Mrs. C. Penford, and F. S. Vallis, the blooms of this last-named being 8in. deep, with a breadth of 11½in. Mr. Bush was also ahead for twenty-four varieties, staging, in addition to the above, Maud Jefferies, J. Lock, George Hemmings, Algernon Davis, Mdme. Rivol, Mrs. Barkley, Mrs. J. W. Coles (a white Barkley), Rev. R. D. Eves, Leon Truelle, Thrumpton Pride, Walter Jinks, Mdme. Paolo Radaelli, and W. Beadle; Mr. S. Brown, Aynho Park Gardens, Banbury, second. Mr. Bush scored first for six white Japanese, with Mrs. A. T. Miller; first for six yellow, with Lady Talbot. Mr. Brown was first with Sapho in the class for any other colour.

The display of fruit in competition comprised fully 200 dishes of pears and apples, and there were some noble clusters of Gros Colmar grapes, exhibited by Mr. S. Brown and the Rev. A. J. Wilson, Tackley Rectory, Oxon. Peasgood's Nonsuch figured as giant examples of apples; and among the pears was a most excellent dish of Marie Louise, staged by Mr. W. G. Baker, of the Botanic Garden, Oxford.

Vegetables are always largely shown, and the collections and single dishes were most meritorious. For nine kinds the awards went to Mr. R. Wadham, gardener to Mrs. R. Bradshaw, Steeple Aston; Mr. J. Holton, gardener to the Provost of Worcester College; and Mr. A. E. Kirtland, Bletchington, Oxon, in the order of their names.

Lyndhurst Gardeners' Association.

On November 4 a meeting of the gardeners of Lyndhurst and district was held in the Parish Room to consider the advisability of forming a Gardeners' Mutual Improvement Association for the district. The meeting was presided over by R. G. Hargreaves, Esq., of Cuffnels Park, and he fully explained the object of the meeting. After some discussion the Chairman proposed that an association be formed, to be called the "Lyndhurst and District Gardeners' Mutual Improvement Association." This was carried unanimously, and a provisional committee was at once appointed to draw up rules, etc., to be presented to a meeting of members. At the close of the meeting the Chairman was accorded a very hearty vote of thanks. The formation of this new society is a step in the right direction; and, having the support of Mr. Hargreaves and other owners of beautiful gardens in the neighbourhood, it is sure to be a big success. The town is situated almost in the heart of the New Forest, and in all directions, for miles around, there is a veritable wealth of magnificent trees and shrubs. Very interesting, indeed, are the many seedlings that spring up from time to time. The new society will have ample matter to discuss, and the results cannot but be highly beneficial to horticulture in the town and its delightful neighbourhood.

National Chrysanthemum Society.

In connection with the trials of single chrysanthemums which is being undertaken during the present year by the National Chrysanthemum Society the members of the Floral Committee paid a visit to the nurseries of Mr. H. J. Jones, at Keston, on Saturday, November 12, for the purpose of inspecting the November varieties. The party were met at Hayes Station by Mr. Jones, and conveyed in carriages to the nurseries at Keston. The committee, under the chairmanship of Mr. D. B. Crane, spent about two hours in drawing up a list of synonymous varieties, and deciding as to the best varieties under each colour heading included in Mr. Jones's collection. The plants under trial were sent by most of the chief trade growers, and represented practically all the November singles worthy of note. The results of these trials will be embodied in a report to be made by the Floral Committee, and this will be in due course issued to the members. After the business of the afternoon was completed, Mr. Jones entertained his visitors to tea, and this in turn was followed by short speeches and reminiscences of great interest to all those who have studied the culture of the chrysanthemum during the last quarter of a century.

National Vegetable Society.

Owing to representations from many of the smaller country competitors, the National Vegetable Society has arranged to hold its next annual exhibition at a rather earlier date than was the case this year. It will therefore take place at the Royal Horticultural Hall on August 30, 1911. The accounts for the past year, ending September 30, have been audited, and a report is being prepared upon the work done by the society during the past year. Copies of the report will be furnished to the members before the annual general meeting takes place on December 6 next. The accounts show a satisfactory balance. In regard to next year's trials, seeds have been sown at Sutton Green, and the liberal manner in which these have been supplied by the trade is much appreciated by the committee.

East Anglian Horticultural Society.

Consequent upon this society winning the challenge cup of the R.H.S. for apples and pears at the exhibition of British-grown fruit, there was a large gathering of members at the November meeting, when the fruit was placed upon view and a report given by Mr. Lewis Smith and Mr. F. J. Endersby, who went to London with the collection. Mr. Smith gave a most interesting discourse, with a table of points and a list of varieties staged by all the societies competing in the class. Mr. Geo. Davison, Westwick Gardens, also supplemented this and was also heartily thanked for the assistance he had rendered upon that occasion, especially with the supplying of the pears.

To again prove that apples can be well grown, and are fairly plentiful in gardens where good culture is maintained, it might be pointed out that at this meeting prizes were offered by Mr. F. Piper, one of the vice-presidents, for two dishes cooking and two of dessert, in which class 40 fine dishes were staged. In the floral section high commendation was given to Mr. W. Shoesmith, gardener to F. H. Harmer, Esq., Cringleford, for his plants of Begonia Gloire de Lorraine, which he had over two feet through, and one mass of bloom. Other exhibits were plentiful and evidenced great cultural skill.

Mr. H. J. Clayton, Ulleskelf, Yorks, had promised a paper for this meeting, but his health would not permit of so long a journey. However, his son, Mr. John Clayton, of Messrs. Daniels Bros., Lim., Norwich, stepped into the breach and gave a very interesting paper upon "Seaside Gardens." Norfolk being a coast-bound county this was very appropriate. In the course of his visits to the noted seaside places, such as Yarmouth, Lowestoft, Cromer, etc., Mr. Clayton had taken notes of those flowers and shrubs which flourished in the public gardens. He dwelt upon the grand way in which annuals bloomed, and the sturdiness of their habit. He also gave lists of many of the choice and rare plants he had seen growing in private gardens whereon the salt spray descended. A good discussion followed, and Mr. Clayton was heartily thanked for his paper.

Reading Gardeners' Association.

At the meeting, held in the Abbey Hall, on November 7, Mr. Alderman Parfitt presided over the largest attendance of the present session. Instead of the usual lecture the committee had arranged competitions of an educational value to the gardener, all the work being done in the room, and in view of the assembled audience.

The first competition, for the best lady's spray and gentleman's buttonhole, was confined to head gardeners and foremen. Eight entries were secured for the three prizes offered, and the judge's award was: First prize, Mr. H. Wynn; second, Mr. H. Goodger; and third, Mr. A. Abraham. The next event was open to all except head gardeners and foremen, and was for five small vases, arranged for effect. This contest attracted eleven entries, and it was decided to award a fourth prize if the work was of sufficient merit to admit it. The judge's decision was: First prize, Mr. A. Francis; second, Mr. A. H. Casey; 3rd, Mr. A. E. Bolton; and fourth, Mr. S. G. Chambers. Twenty minutes was the time allotted for work in both competitions. The judges, Messrs. T. Tunbridge, W. Butler, and W. G. Pigg, accomplished their somewhat difficult task to the entire satisfaction of all concerned, and complimented the prize-winners on the admirable work executed by them. The character of the work having been criticised by several speakers, the president presented the prizes, all the winners being loudly cheered. On the business side of the meeting the President urged the members to do their utmost to make the forthcoming exhibition on November 23 an even greater success than last year, and as evidence of the extraordinary vitality of the association no fewer than ten new members were elected.

Messrs. Tunbridge, Powell, Wilson, Bailey, Judd, F. Townsend, Loader, W. J. Townsend, H. Goodger, G. Durrant, and A. Webb kindly brought bunches of flowers, which next morning were forwarded by the hon. secretary to the Royal Berkshire Hospital.

The meeting closed with votes of thanks to the judges for officiating, and to Mr. J. E. Phillips and Messrs. Watson and Son for kindly loaning the tables and the vases used for the competitions.

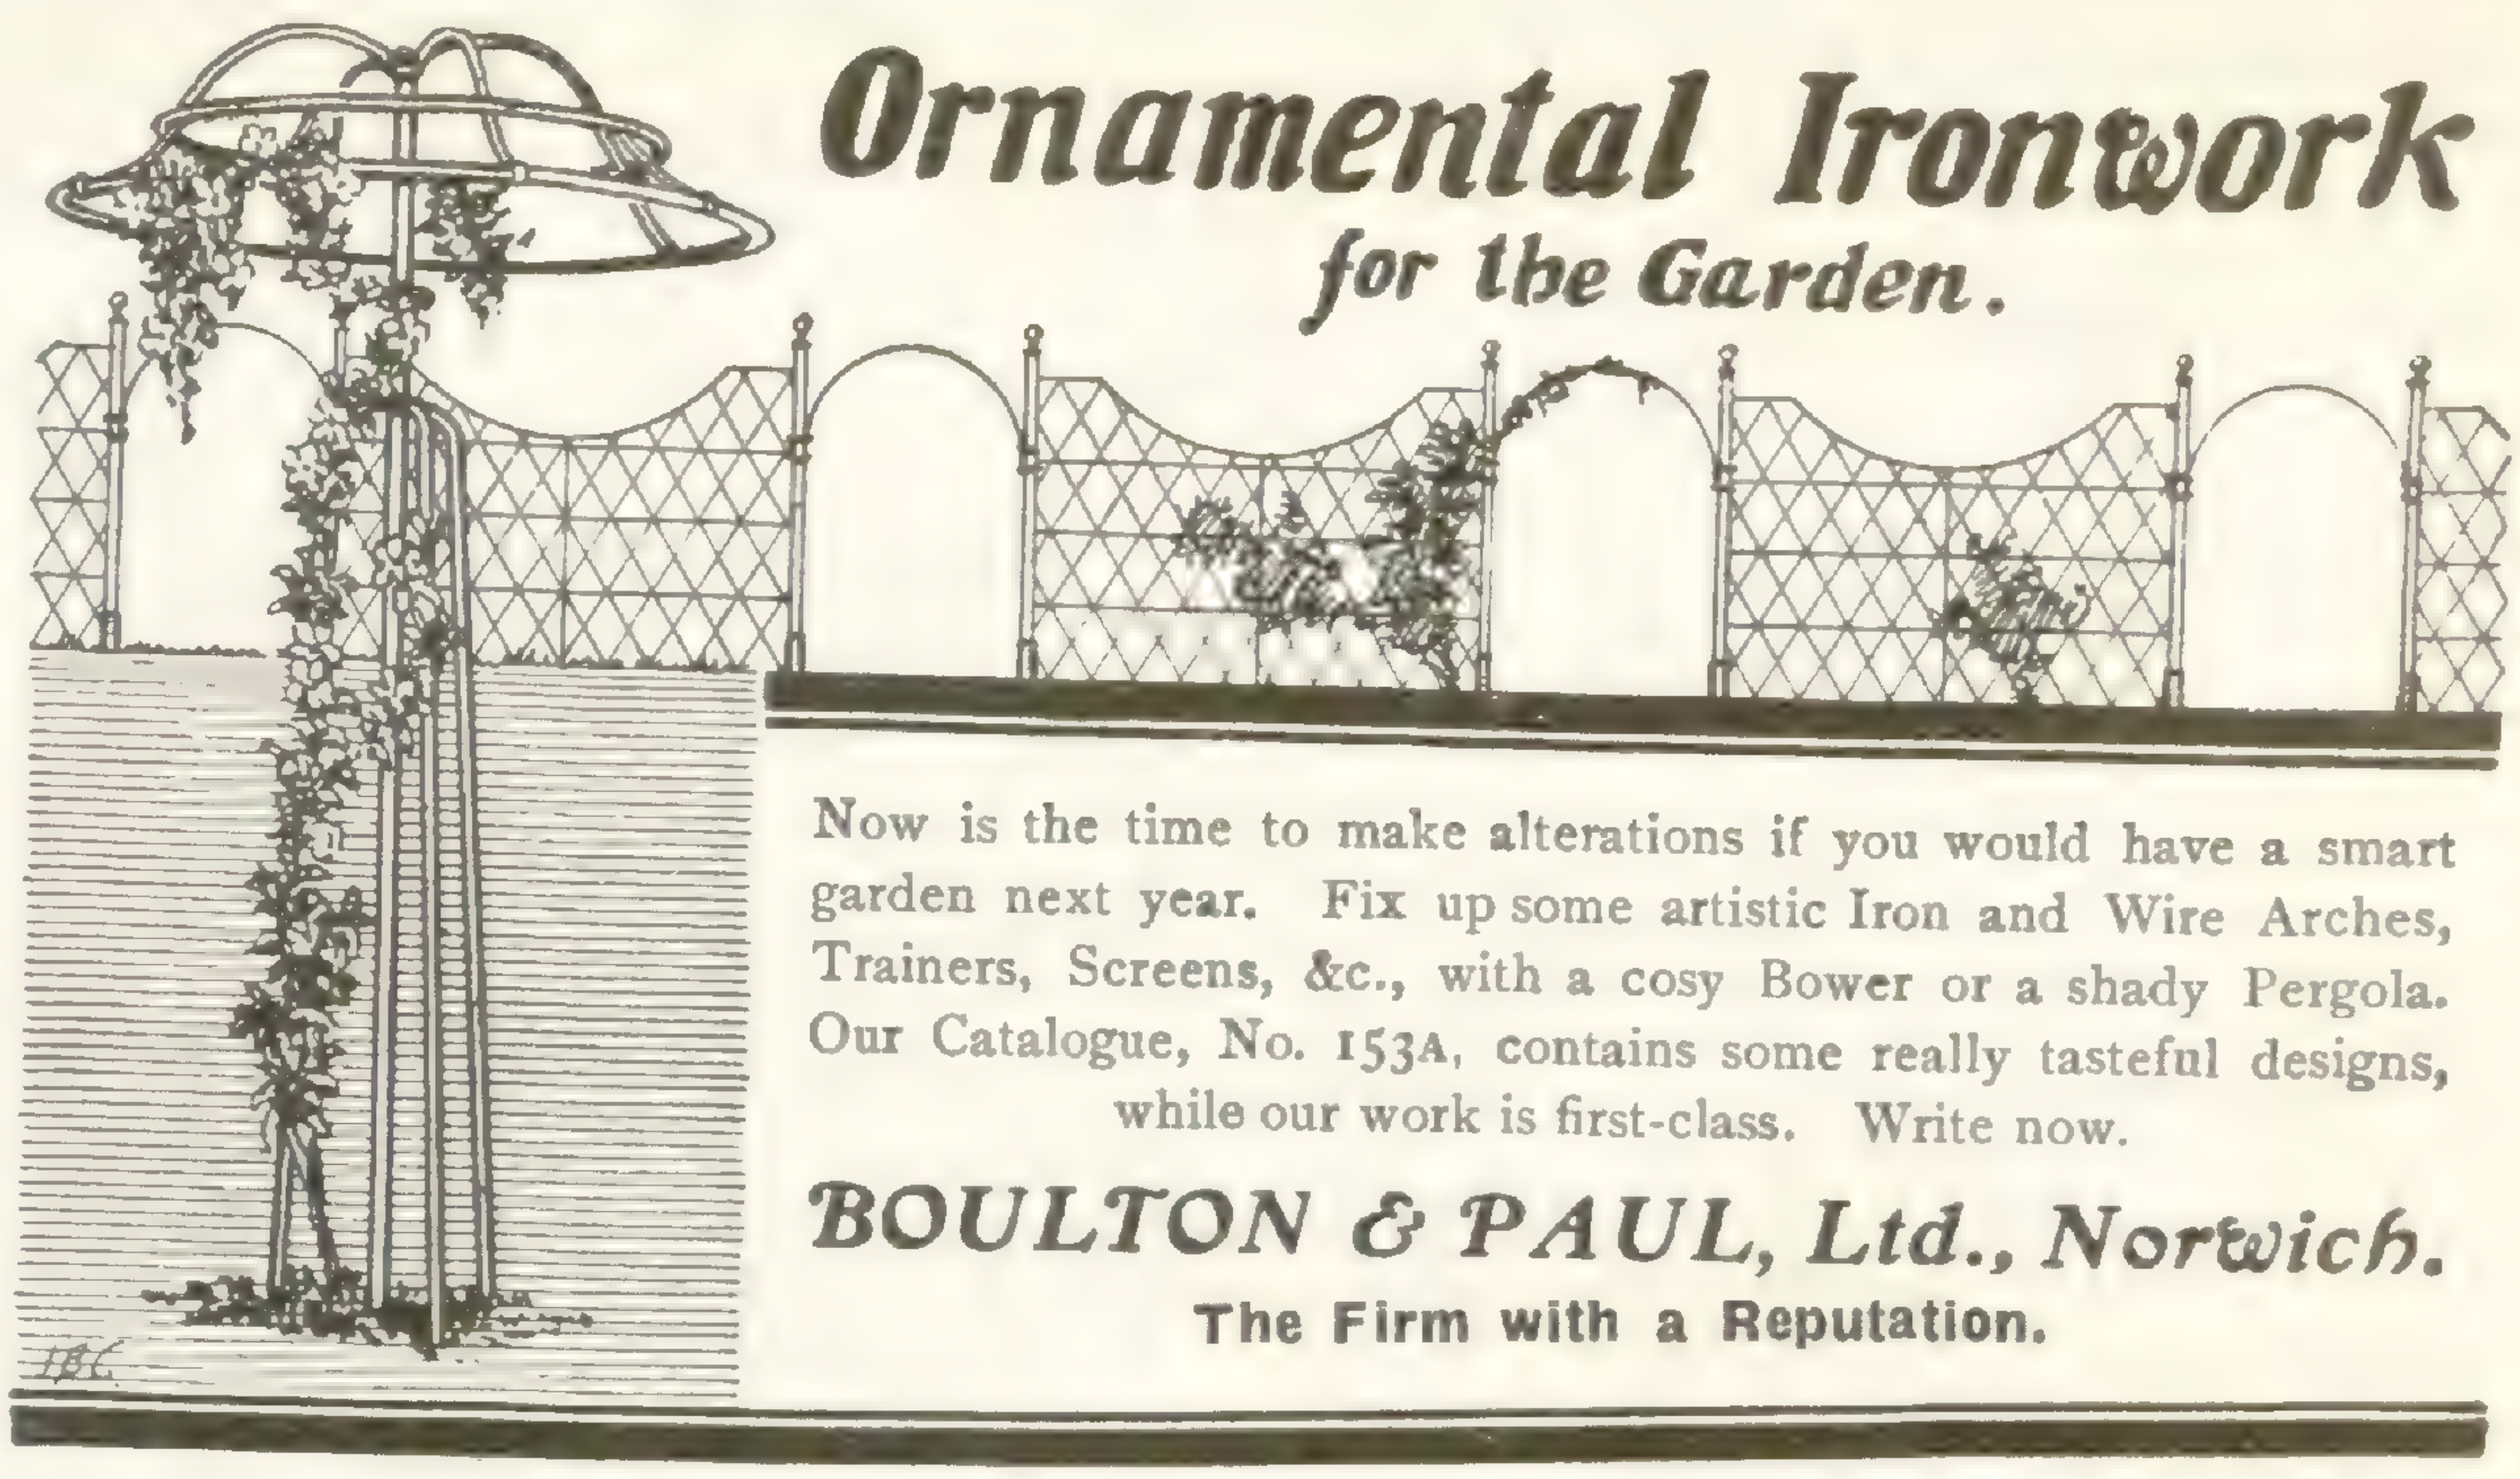
Staffs in British, Indian, and Colonial Botanic Gardens.—In the form of an appendix to the "Kew Bulletin" there has just been issued a new list of staffs in botanical gardens at home, in India, and the Colonies. The list runs into fourteen pages, and is extremely interesting. The influence of Kew in our Colonies and India is very marked, as shown by the large number of curators, etc., that have been trained at or recommended by the Kew authorities.



Ornamental Ironwork for the Garden.

Now is the time to make alterations if you would have a smart garden next year. Fix up some artistic Iron and Wire Arches, Trainers, Screens, &c., with a cosy Bower or a shady Pergola. Our Catalogue, No. 153A, contains some really tasteful designs, while our work is first-class. Write now.

BOULTON & PAUL, Ltd., Norwich.
The Firm with a Reputation.

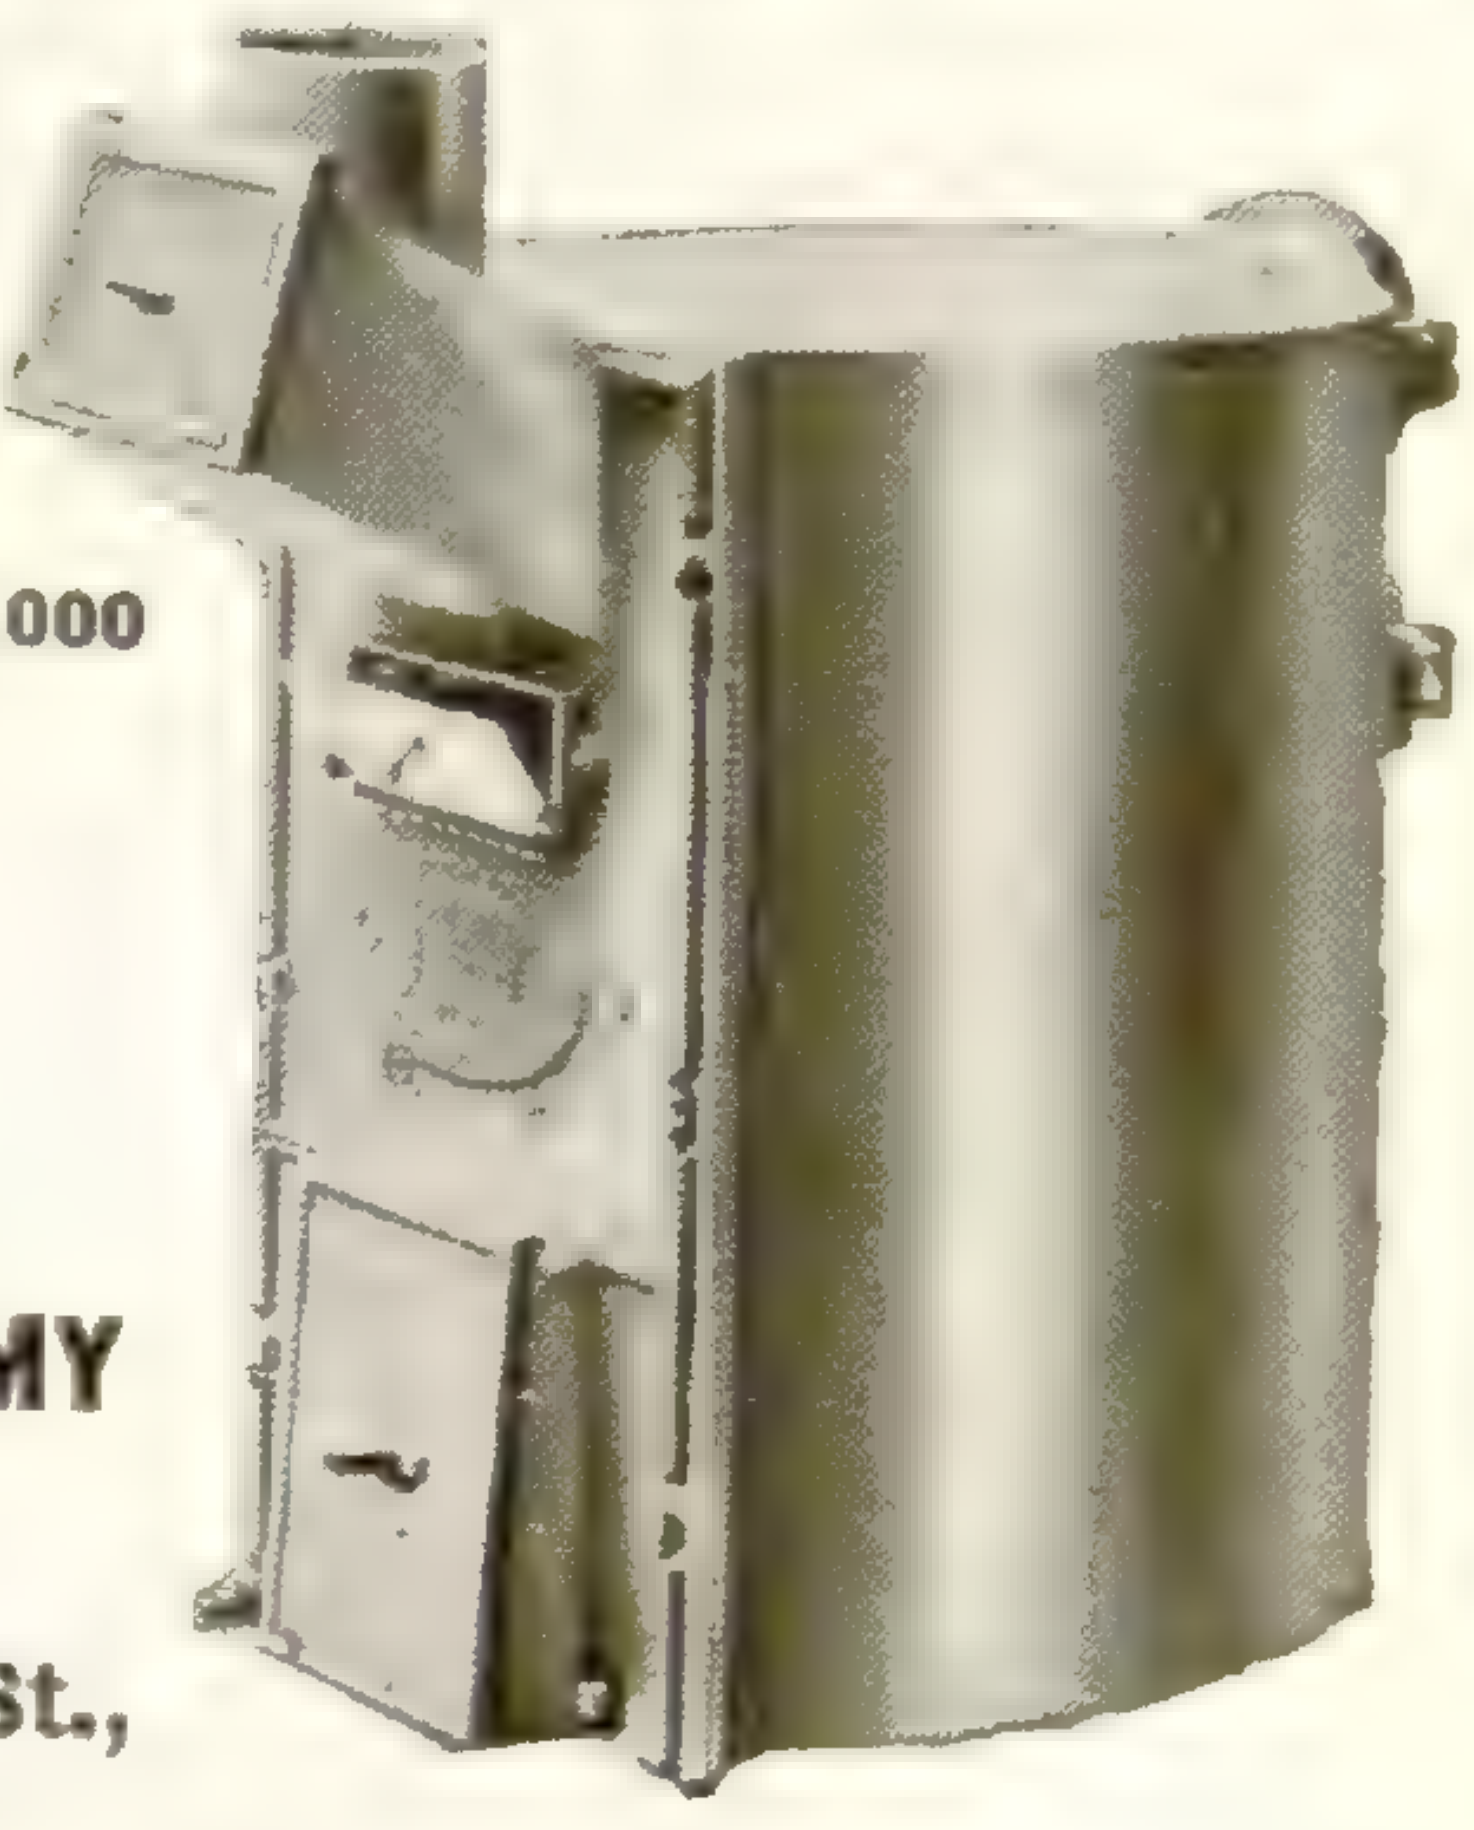
The Gardener & his Family must have Dry, Comfortable, Easy Going BOOTS.

THE Gardener in whatever capacity must have foot comfort, the first necessity of an active mind and body. If the feet are wrong then all's wrong. We recommend our special footwear to old and young for outdoor wear.

The Stout Chrome Calf Greenhouse wear 11/9 | The Nailed Gardener Boot 10/6

We make special quality Boots for the whole family. Write for free illustrated price list No. 14 and select what you fancy. We know you'll come again and again.

NORWELL'S BOOT FACTORY, PERTH, Scotland.
Established over 100 years.



"Horse Shoe" Boilers

Are the most ingenious Fuel & Labour Savers invented. Sale approaching 30,000

Coal and Coke Contractor, DEWSBURY.
Phone 243. Established 1880.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

STRAWBERRIES.—J. C. W., St. Albans: Clear away all weeds and dead leaves; give a dressing of basic slag at the rate of 2oz. to the square yard, point this in with a fork, and then apply a mulching of quite short, half-decayed manure.

MUSHROOMS.—S. S., Everton: A handy little book dealing with mushroom culture under various conditions, with the pests that attack mushrooms, and methods of cooking mushrooms, etc., is "Mushrooms and their Cultivation," which can be obtained from the GARDENERS' MAGAZINE Office, 148-149, Aldersgate Street, E.C., post free for 1s. 2d.

STORING BEGONIA TUBERS.—F. S. B., Hereford: As soon as soil adhering to the lifted tubers is perfectly dry proceed to thoroughly clean the tubers, and, having done this, store them in finely-sifted dry leaf-soil and place in a shed or cupboard where a temperature of 40 to 45 deg. is maintained. If any tubers are bruised or otherwise damaged remove the affected portions by means of a sharp knife, and dip the cut surface in finely-powdered dry charcoal. Leave them on a shelf in a greenhouse to heal, and then store them away.

EARLY-FLOWERING CHRYSANTHEMUMS.—L. P., Brightlingsea: Lift two or three stools of each variety you wish to retain, and either pot these, or, better still, place them in boxes, packing soil tightly about the roots and giving them a good dusting with soot. Then put the stools in a cold frame, and only give shelter during particularly severe weather or during snow and rain. Abundance of growths will start from these stools in the new year, and they may be made into cuttings and rooted in an unheated frame in February or March. These should be potted as necessary, and be in large 60-sized pots, in fine condition for planting out by the end of April or early May.

LOGANBERRY ON COLD SOIL.—M. E. J., Derby: The late Mr. J. C. Tallack was particularly successful in his method of cultivating the Loganberry at Shipley Hall, and we cannot do better than give you the advice contained in an article from his pen about two years ago. He wrote: "Here we grow most of the stock on a split-oak fence facing east and in heavy, cold soil. It appears to enjoy both the soil and position, and grows and crops remarkably well. We plant at 15ft. apart, and the plants would do with even more room than this. The canes grow so freely and plentifully that up to the time the fruit is gathered the fruiting canes cut out, and the young ones for the next season tied into position, the plants cover a big space, and other crops should not be grown very near. Hence the advisability of utilising for the culture of this fruit any out-of-the-way fence which may have been erected primarily to hide an unsightly portion of the ground. The main cultural details, when once the plants are established, are to see that the principal old canes are cut away directly the crop is over, to make room for the young canes, which should then be tied or otherwise secured in position. About three rows of strong wire running along a fence of, say, 8ft. or 9ft. high will be quite sufficient for providing support for the canes. In the spring the canes should be examined, and any damaged tips removed, cutting back into sound wood, but no farther, as the longer the canes the heavier the crop. In dry seasons or in poor soil a good mulch of manure would be useful, though where the soil is heavy and the position rather shaded there is no need for any application of the kind until, perhaps, the plants show some signs of exhaustion.

HERBACEOUS CLEMATIS.—M. P. E., Bristol: The herbaceous clematises now form a most interesting group, and include several hybrids. Ordinary good garden soil suits them, and they need a fair amount of room for development. C. recta and its double variety grow about 3ft. high, and carry an abundance of small white flowers in early summer. C. integrifolia has blue, bell-shaped flowers, and C. Durandi appears to be a continuous-flowering form of the latter. C. heracleæfolia and C. Davidi have much in common, the former having purplish flowers and the latter pale blue, fragrant ones. Hybrids between C. Davidiana and C. Stans, raised by M. Lemoine, of Nancy, include those named Azur, blue, very free; Columbine, violet; Crepuscle, pale blue, tall; Cypris, turquoise-blue, tall; Fraicheur, dwarf, flowers rather large, lilac; Iris, bright blue; Phare, porcelain-blue; Hybrida, pale blue, very compact habit; Gerbe Fleurie, very like C. Davidiana, but with lilac-blue flowers; and Profusion, blue with cream centre.

THERMOMETER RECKONINGS. — F. E. S., Eastbourne: To convert degrees Centigrade above zero to degrees Fahrenheit, multiply by 1.8 and add 32. To convert degrees Centigrade below zero to degrees Fahrenheit, multiply by 1.8 and subtract from 32. To convert degrees of Centigrade into those of Reaumur, multiply by 4 and divide by 5. To convert degrees Reaumur above zero to degrees Fahrenheit, multiply by 2.25 and add 32. To convert degrees Reaumur below zero to degrees Fahrenheit, multiply by 2.25 and subtract from 32. To convert degrees Reaumur into those of Centigrade, multiply by 5 and divide by 4. To convert degrees of Fahrenheit into those of Centigrade, deduct 32, multiply by 5, and divide by 9. To convert degrees of Fahrenheit into those of Reaumur, deduct 32, divide by 9, and multiply by 4. In De Lisle's thermometer, used in Russia, the graduation begins at boiling-point, which is marked zero, and the freezing-point is 150. The sign — (minus) indicates below zero in Centigrade reckonings, the freezing point being zero of Centigrade and Reaumur, and 40 degrees below freezing of Fahrenheit. For rough-and-ready purposes a degree of Fahrenheit may be considered the equivalent of 1 degree Reaumur, 1¾ degrees Centigrade. In books addressed to English readers thermometrical readings should always be stated in accordance with the Fahrenheit scale.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

M. G., Horsham.—1, Ardisia mamillaria; 2, A. crenulata; 3, Primula Kewensis.

B. S., Taunton.—1, Oncidium varicosum Rogersi; 2, Odontoglossum ardentissimum.

T. G. N., Warrington.—1, Cypripedium Leeanum giganteum; 2, C. Memoria Moensi; 3, C. Lathomianum.

A. P. P., Chesterfield.—1, Berberis stenophylla; 2, Selaginella Kraussiana aurea; 3, Linum trigynum; 4, Salvia azurea.

W. H., Surbiton.—1, Pteris longifolia; 2, Brainea insignis; 3, Didymochlæna lunulata; 4, Berberis Wallichiana; 5, Cotoneaster horizontalis; 6, Cryptomeria elegans.

S. S., Bovey Tracey.—1, Sequoia gigantea; 2, S. sempervirens; 3, Cedrus Deodara.

G. D. B., Leicester.—1, a fine form of Begonia Gloire de Lorraine, probably the one known as Mrs. Leopold de Rothschild.

NAMES OF FRUITS.

When sending fruits for naming, will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, GARDENERS' MAGAZINE, as advised in the notice at the head of "Answers to Correspondents."

G. E., Canterbury.—A very fine specimen of Mère de Ménage.

B. C. M., Walkley.—1, Alfriston; 2, Bramley's Seedling; 3, Fearn's Pippin.

R. A., Ipswich.—1, Bramley's Seedling; 2, Hormead's Pearmain; 3, Bess Pool.

I. D. J., Waterford.—1, Emperor Alexander; 2, Tyler's Kernel; 3, Reinette du Canada.

M. B. R., Chertsey.—1, Golden Noble; 2, Dumelow's Seedling; 3, Hollandbury; 4, Queen Caroline.

F. E. J., Knebworth.—1, Blenheim Pippin; 2, King of the Pippins; 3, not recognised; 4, Vicar of Winkfield; 5, Lane's Prince Albert.

B. B. W., Cheltenham.—1, Beurre Diel; 2, Beurre Rance; 3, Catillac; 4, Court Pendu Plat; 5, Adam's Pearmain; 6, Warner's King—an excellent set of clean specimens.

TRADE NOTE.

Mr. David Barr, for the last twenty years manager to the firm of Messrs. Thomas Kennedy and Co., nurserymen, Dumfries, and Mr. David H. Hunter, for the last fourteen years manager to Messrs. William Learmont and Son, Larchfield Nurseries, Dumfries, have acquired by purchase the seed and nursery business of Messrs. James Service and Sons, Maxwelltown, Dumfries. The business will continue to be carried on in all its branches by these gentlemen, under the old name of James Service and Sons.

CATALOGUES RECEIVED.

HELLIER AND SONS, WINCHESTER.—From this firm we have received a series of neat catalogues dealing respectively with fruit trees, bulbs, hardy perennials, forest trees, and roses.

W. ATLEE BURPEE AND CO., PHILADELPHIA, U.S.A.—A list of choice new sweet peas for 1911, the striking novelties being Ethel Roosevelt and Florence Nightingale.

HENRY DREW, LONGWORTH, BERKS.—A descriptive catalogue of roses.

HERD BROS., PENRITH.—An interesting catalogue of forest trees, ornamental trees, fruit trees, clematis, etc.

G. W. PIPER, UCKFIELD.—A descriptive catalogue of roses, with the varieties arranged in alphabetical order.

HAYWARD MATHIAS, MEDSTEAD, HANTS.—A list of border, Malmaison, and perpetual carnations, and of picotees.

H. CANNELL AND SONS, SWANLEY.—This catalogue is devoted chiefly to roses, but bulbs, flowering roots, and seeds are also included.

THOMAS RIVERS AND SON, SAWBRIDGEWORTH.—The new edition of this firm's autumn catalogue of fruit trees, roses, and shrubs, is fully as useful and interesting as its many predecessors, and we cannot more highly praise it than this.

CHAS. P. KINNELL AND CO., LIM., 65, Southwark Street, S.E.—A useful catalogue dealing with heating apparatus for houses of various kinds. The Horse Shoe boiler is fully described, and its special virtues referred to.

Salvia azurea grandiflora.—Though chrysanthemums are indispensable for greenhouse decoration in the autumn, it is sometimes said that the range of colour in the flowers is not sufficient to make them perfect in this respect. True, there are no blue ones, hence this salvia, which blooms at the same time, and supplies this missing colour, merits a special note. It is of spare growth, and needs to be stopped freely when young in order to obtain a number of shoots. In this way plants four to six feet high can be obtained, every shoot being studded for some distance with beautiful blue flowers. It is also known as Salvia Pitcheri.—W. T.

MANNA.

Manna is collected from the tarfa, or tamarisk, the manna ash, the camel thorn, the larch, the cedar, the Australian Eucalyptus viminalis, and even some edible lichens, such as Lecanora esculenta, and its allied species are known by this name. According to Burckhardt the manna from the tamarisk (Tamarix gallica) drops from the thorns, on the sticks and leaves with which the ground around these trees is usually covered, and must be gathered early in the day or it will be melted by the sun. "The Arabs cleanse and boil it, strain it through a cloth, and put it into leathern bottles, and in this way keep it uninjured for several years. The manna ashes (Fraxinus ornus, F. Europæa, and F. rotundifolia), yield manna in consequence of a puncture made by an insect resembling the locust, known as Coccus mannifarus. The substance is fluid at night, and resembles dew, but begins to harden in the morning, Fraxinus ornus was introduced into England in 1730 by Dr. Uvedale.

The camel thorn, which grows in Northern India and Syria, produces the description known as Al baj, or Persian manna. The larch and the famous cedars of Lebanon also furnish a manna of their own, but although prized and eaten by the natives of the countries where they are found, these kinds of manna do not seem to possess the useful properties of the manna ash, which is the manna of European commerce. The Australian Eucalyptus viminalis exudes crumbs of an edible manna, which is very sweet, and is used to produce the opaque drops called honey-manna, or melitose.

Of the edible manna lichens, Lecanora esculenta, and Lecanora tartarea, the colouring matter known as litmus is made. This kind of lichen is sometimes torn up and transported by violent gusts of wind and falls in showers several inches thick. In 1829, during the war between Persia and Russia, there was a great famine in Oroomiah, south-west of the Caspian sea. "One day during a violent storm the surface of the country was covered with lichens, which fell from the sky in showers. The sheep immediately attacked and devoured it eagerly, which suggested to the inhabitants the idea of reducing it into flour and making bread of it, which was found to be palatable and nourishing."

During the siege of Herat, there is mention made of a hail of manna which fell upon the city and provided the inhabitants with food. In April, 1846, in the government of Wilna, says "Indian Planting and Gardening," a rain of manna occurred, forming a layer upon the ground three or four inches thick. It was of greyish-white colour, rather hard, irregular in form, inodorous and insipid. It is to be found in the great desert of Tartary, on the steppes to the north of the Caspian sea, in the Altai range, in South America, and in Algeria.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Hairs, Bristles, Thorns, etc.

The superficial growths on members of the plant and animal world vary so much in appearance, and yet agree so much in origin, that the use of an etc. is unavoidable in the heading of an article referring to them generally. The most diverse forms are found to merge together by innumerable links, as in the animal world we may see in the porcupine and the hedgehog, in which two animals we may find the long horny quills of the former exactly imitated in the far smaller bristles of the latter, which, again, will be found to merge into nothing more formidable than hair in one and the same animal. Even the protective scales of fishes may be regarded as modified hairs, and in the scale direction we may go as far as the turtle and armadillo as examples of hair modification into actual armour plating, as an extreme in one direction, while the softest down of the eider duck, or the plumage of the ostrich, form the extreme in another. In the plant world, too, a great diversity is found. A vast number of leaves bear superficial hairy growths, as, for example, the mullein, salvia, and Antennaria tomentosa, and these are of great service in resisting transpiration, while it is easy to imagine also that a plant thickly bristling with such outgrowths must also be well calculated to resist insect approach and attack. Such superficial hairs vary greatly in form, sometimes being branched, and even star-shaped, which form, when sessile, gives us the clue to the transformation of hairs into scales, those of Hippophæ rhamnoides exactly resembling the stellate scales of the turbot. In the fern family we may see all grades of such transformation, from the fine downy white covering of the young fronds of the hart's-tongue to the large netted scales of the shield ferns, and many others. In the cactus tribe we have, perhaps, the most remarkable development of hairs into formidable protective chevaux-de-frise, in the shape of long obvious spines, at the bases of which there are myriads of minute and much more insidious barbs, which are more to be feared by the inquisitive traveller than the large ones. In this same family, on the other hand, we find these defences transformed into long fine silky hairs, as in the so-called "old man" cactus. Another purpose served by plant hairs is that of seed dissemination, and in this direction again we find great diversity. Thus, in the familiar burr and goose grass of our hedges we find examples of hooked hairs, which enable the seeds to adhere to the coats of animals, including man himself, while in the dandelion they take the form of downy parachutes of extreme delicacy, which utilise the friendly breezes as their conveyers far and wide. In this latter connection we have the cotton down, which forms so great a staple of trade and manufacture as to constitute one of the chief industries of the world. There are, however, other forms of hairs of a quite different class. Thus we have the curious poisonous hairs of the nettle, fine brittle tubes with a bag of venom at their bases, capable at a touch of inflicting a troublesome wound upon any thin-skinned aggressor; and in quite another direction we have the sensitive hairs of the sundew, transformed into tentacles tipped with viscous dew, and endowed with the power of appreciating the near presence of a victim which has come into contact with one of them, and bending over to aid in its capture and subsequent digestion. In the dionæa, or Venus's fly trap, we see three little hairs similarly gifted in the centre of a valved leaf, which, at a touch, snaps together and enshrouds the poor victim in an extemporised stomach, as does the sundew aforesaid. We have already mentioned the thorns of the cactus tribe as examples of hair modification, but there are also the innumerable other thorns, which are less obviously so, such as those of the rose family, the roses proper, the brambles, etc., etc., in which the thorns spring from the stem, these, too, as epidermal outgrowths, must also be classed as modified hairs; but in the prickly gorse we must assume the thorns to be aborted leaves instead, which is also the case in many other instances; Nature here, as always, being able to produce similar results by different methods. In the holly we see thorny leaves, due to hard texture and acutely pointed extensions of the margin, and in some cases even the surface breaks out into thorns, in which case it is rather a question whether these latter do not belong to the "hair" category of excrescences. Still another form of hair is seen in the "glands" which are found on an immense number of plants as very small stalked outgrowths with globular tips, often containing the essential oils which yield the odour of the plant or flower concerned, when, by passing the leaf or blossom through the hand, these are ruptured, and their contents escape. The subject, indeed, is a so very wide one that we have only been able to touch the fringe of it.

MR. GEORGE MACKINLAY.

Mr. George Mackinlay, so well known as head gardener to His Excellency the United States Ambassador, at Wrest Park, Ampthill, Bedford, is one of the most popular of private gardeners, and he is as able as he is popular. He has a large garden under his charge, and, as His Excellency entertains largely, this means a vast amount of decorating and a smart upkeep of the large flower garden and extensive pleasure grounds. Mr. Mackinlay has had a very wide experience in horticultural practice, and began his career at Avocha, in the Black Isle, Renfrewshire; afterwards he was employed as journeyman in the kitchen garden at Riccarton House, Midlothian, and subsequently in the flower garden at the same establishment. He then went as foreman at Castle Simple, Renfrewshire, and eventually occupied a similar position at Mohale Castle, Midlothian, at Gosford House, Haddington, at Mareno Park, co. Dublin, and at Dalkeith Palace, Dalkeith. He was head gardener first at Tulloch Castle, Ross-shire; then at Blackwood House, Lanarkshire; at Lamport Hall, Northampton, and then at Wrest Park, where he has been head gardener for the past fifteen years—a record of experience in three of the countries of the United Kingdom that it would be difficult to beat.

Sweet Peas in Scotland.—The Perthshire Sweet Pea Society, which was formed about twelve months ago, has met with a measure of success that fully justifies the anticipation that it will soon become a strong organisation. The annual meeting was held at Perth a few days since, and the Rev. J. S. Clark, the president, stated in the course of his opening address that the society had received such hearty support as to suggest to some of the members the advisability of altering the name of the organisation to the Scottish National Sweet Pea Society. Mr. R. A. Halley, reporting on the work of the year, said the enthusiasm which had been shown on the foundation of the society was unabated, and that their members, now numbering 144, were drawn from a wide area, this extending from the Border Counties on the south to Forres in the north. The prospects for next year were, he considered, bright, although Mr. Mechi, the treasurer, reported a debit balance of £28 1s. 11d., this being largely due to the unfavourable weather experienced on the day of the show and to the expense incidental to the formation of the society. With regard to the proposal to alter the name of the society, he did not consider the proper time had arrived for making the change, and, on his suggestion, it was decided to let the matter stand over for a year. The Rev. Harold Mayal Courrie was elected president, and Mr. R. S. Halley, and Mr. A. M. Mechi were re-elected secretary and treasurer respectively.

Purchased Gooseberry Bushes.—In consequence of the spread of American gooseberry mildew during the past summer, the Board of Agriculture recommend purchasers of gooseberry bushes, from whatever source they are obtained, to examine their purchases very carefully on delivery, to cleanse the plants thoroughly from all earth, and to remove and burn the tips of the shoots before planting. If any trace of disease is found the purchaser should communicate with the Board and supply full information as to the sources from which the consignments were obtained, in order that the matter may be investigated.

Irish Potato Crop.—According to the official returns of the acreage under crops in Ireland, the total area of potatoes in 1910 was 593,065 acres, as compared with 579,799 acres in 1909, an increase of 13,266 acres or 2.3 per cent. There was an increase in Leinster of 2,712 acres, in Munster of 1,320 acres, in Ulster of 2,103 acres, and in Connaught of 7,131 acres. In Leinster the increase was chiefly in King's County, Longford, Queen's County, Westmeath, and Wexford. In Munster the increase was chiefly in Clare and Kerry. In Ulster the increases were chiefly in the counties Armagh, Cavan, and Donegal. In Connaught there was an increase in all counties, but chiefly in Galway and Mayo. The increase in the area of potatoes this year is the first recorded increase in the total extent of that crop in Ireland within the past twenty-two years.

Mr. Harman Payne.—On the occasion of the opening ceremony of the International Chrysanthemum Show and Congress, recently held in Paris, M. Viger formally presented our old friend and correspondent, Mr. Harman Payne, to M. Fallières, the President of the French Republic. Five years ago M. Viger did Mr. Payne the honour of presenting him to President Loubet, under similar circumstances.

Bright Sunshine in November is usually so limited in amount that the sunny weather which has been experienced since the commencement of the month is a matter of considerable interest. There are, on an average, in London, thirteen days in November in which bright sunshine is absent, but in the current month there had been, up to the 20th inst., only three such days. The total duration of sunshine up to the date mentioned was 35.6 hours, or nine hours in excess of the average for the month. According to the record of the Westminster Meteorological Station for the past twenty-seven years this aggregate has only been exceeded during that period four times by the amount registered for the whole of November. The highest total was in 1894, when 60.5 hours were registered. In 1908 the amount registered was 46 hours, in 1905 45 hours, and in 1883 41 hours. The dullest Novembers during the past twenty-seven years were those of 1897 and 1901, when 7 hours, or about 25 per cent. of the average, bright sunshine were registered.

A Conference on Fruit Culture will be held at the South-Eastern Agricultural College, Wye, on Friday, December 2, and the chair will be taken at 11.30 a.m., by Mr. C. S. Martin, president of the National Fruit Growers' Federation. An introductory address will be given by Mr. J. R. Dunston, principal of the college, and Mr. C. S. Martin will give an address on "The Work and Aims of the National Fruit Growers' Federation." The following papers will be read before luncheon: "Grading, and the Boxing of English Apples," by Mr. J. A. Raynham and Mr. C. S. Smith, of Wye College; "The Marketing of Fruit and Vegetables," by Mr. G. F. Hooper; "Co-operation as an Aid to Fruit Growers," by Colonel A. C. Borton; "Commissions for the Selling of Fruit in London and the Provinces," by Mr. F. Ivo Neame. Proceedings will be resumed at 2.30, when the following papers will be read: "Commercial Varieties of Apples," by Mr. C. S. Smith, of Wye College; "Grease-banding and Red Spider on Fruit," by Mr. F. V. Theobald, of Wye College; "Some Fungus Diseases of Fruit," by Mr. E. S. Salmon, of Wye College; "Soil Analysis and its Use to the Fruit Grower," by Dr. W. Goodwin, of Wye College. There will be an exhibition of English apples in boxes and a trade exhibition of boxes and non-returnable packages.

Dr. Dukinfeld H. Scott, F.R.S., famous for his researches in fossil flora, especially in connection with the flora of the coal measures, has been elected a corresponding member of the Munich Academy of Sciences, as has also Dr. L. Fletcher, the Director of the Natural History Museum, South Kensington.

R.H.S. Exhibitions and Meetings, 1911.—The dates of the exhibitions and meetings that will be held by the Royal Horticultural Society during 1911 are as under: Exhibitions.—March 14 and 15, Spring Bulbs; May 9, Auriculas and Primulas (National Auricula Society); May 23 to 25, Temple Show; July 4 to 6, Summer Show at Olympia; July 11 and 12, Sweet Peas (National Sweet Pea Society); July 25, Carnations (National Carnation and Picotee Society); August 30, Vegetables (National Vegetable Society); September 14, Autumn Roses (National Rose Society); September 26, R.H.S. Vegetable Prizes; October 10, British-grown Fruits; November 30 to December 2, Colonial Fruits; December 12, Carnations (Perpetual Carnation Society). Meetings of the several committees: January 3, 17, 31; February 14, 28; March 14, 28; April 11, 25; May 9, 23; June 6, 20; July 4, 18; August 1, 15 (committees will meet upstairs, but there will be no show on this date), 29; September 12, 26; October 10, 24; November 7, 21; December 5, 19 (committees will meet as usual on this date, but there will be no flower show).

Burton-on-Trent Chrysanthemum Show was, a correspondent informs us, a great success. Especially noteworthy for their high quality were the Japanese and incurved blooms, while the single and decorative varieties were so largely shown as to produce bright displays of colour. Mr. R. Nisbet, gardener to Sir William Bass, was first in the open classes for eighteen and twelve Japanese, and for twelve incurved.

Kew Guild.—Mr. H. Cowley has been appointed secretary of the Kew Guild, and editor of the "Journal." All correspondence relating to the guild, and communications for the next issue of the "Journal" (which will appear shortly) should be addressed to Mr. Cowley, at South Side, The Green, Kew, Surrey.

Potato Markets are just now being regarded with more interest than is customary at this season of the year. In the corresponding month of last year depression prevailed in all the principal markets because of the great abundance of supplies, but now potatoes are less plentiful owing in part to the crop having been rather lighter than usual, and to the area under potatoes having been 36,000 acres less than last year. In August the wretched weather gave rise to the gravest apprehension with regard to the disease, and the greater proportion of the growers sold their crops as quickly as possible. The buyers incurred considerable risk, but, as the weather during September was highly favourable to the potato crop, and the prices advanced by about £1 per ton, their purchases have proved highly profitable.

The Rev. T. Sheepshanks, of Chudleigh, specially distinguished himself in the competition in the open classes for cut blooms at the recent exhibition of the West of England Chrysanthemum Society, held at Plymouth. He obtained premier honours in the classes for forty-eight and twelve Japanese blooms, for twelve incurved, and for eighteen blooms arranged in vases.

Chrysanthemum Conference.—The National Chrysanthemum Society will hold a conference at Essex Hall, Strand, on December 5. There will be an afternoon and an evening session. At the former Sir Albert Rollit will preside at 3 p.m., and a paper will be read on "The Culture of Japanese Chrysanthemums for Exhibition" by Mr. Norman Davis, to be followed by a paper on "The Culture of

Incurved Chrysanthemums for Exhibition" by Mr. W. Higgs. The evening session will commence at 6.30 p.m., when Mr. Thomas Bevan will preside. To begin with there will be two short papers by Mr. H. J. Jones and Mr. R. F. Felton respectively on "Methods of Exhibiting Japanese and Incurved Chrysanthemums" and "The Use of Large Blooms in Floral Decorations." Mr. Thomas Stevenson is due to read a paper on "Late-struck Japanese Chrysanthemums for Exhibition," at 7.30, and the proceedings will conclude about 8.30 p.m. There will be a display of chrysanthemums at the Essex Hall, and this will be open to inspection from 3 p.m. to 9 p.m.

The New Daffodil Classification.—For the second time within three years a new Classification of Daffodils has been brought forward under the authority of the Royal Horticultural Society, and we trust that the specialists will, as a body, adopt and follow the latest efforts of some of the most eminent raisers and growers. In the new classification just issued by the R.H.S. the flowers are classed into eleven divisions: Trumpet Daffodils, Incomparabilis, Barri (incorporating Burbidgei), Leedsi, Triandrus Hybrids, Cyclamineus Hybrids, Jonquilla Hybrids, Tazetta and Tazetta Hybrids, Poeticus varieties, Double varieties, and Various, the latter including various species. The first three divisions are again sub-divided according to the colour of the varieties. After the explanation of the classification there follows fifty-three pages of daffodil names, and, allowing a fair margin for cross references, there must be well over 2,000 varieties and species listed. The great majority of these are classified. For example, we take the well-known Emperor, and find it set out thus: "1a, Emperor (Backhouse)," and on referring to the classification find this to mean that Emperor was raised by Backhouse, it is a (1) Trumpet variety, and has (a) a "yellow or lemon-coloured trumpet and perianth of same shade or lighter (but not white)." The work of pigeonholing this huge list of varieties must have been very great, while that of bringing so many names together and preparing the new "Classified List of Daffodil Names, 1910," must have been both tedious and considerable. The booklet is issued from the R.H.S. offices at 1s., and it should be in the hands of all enthusiastic daffodil lovers.

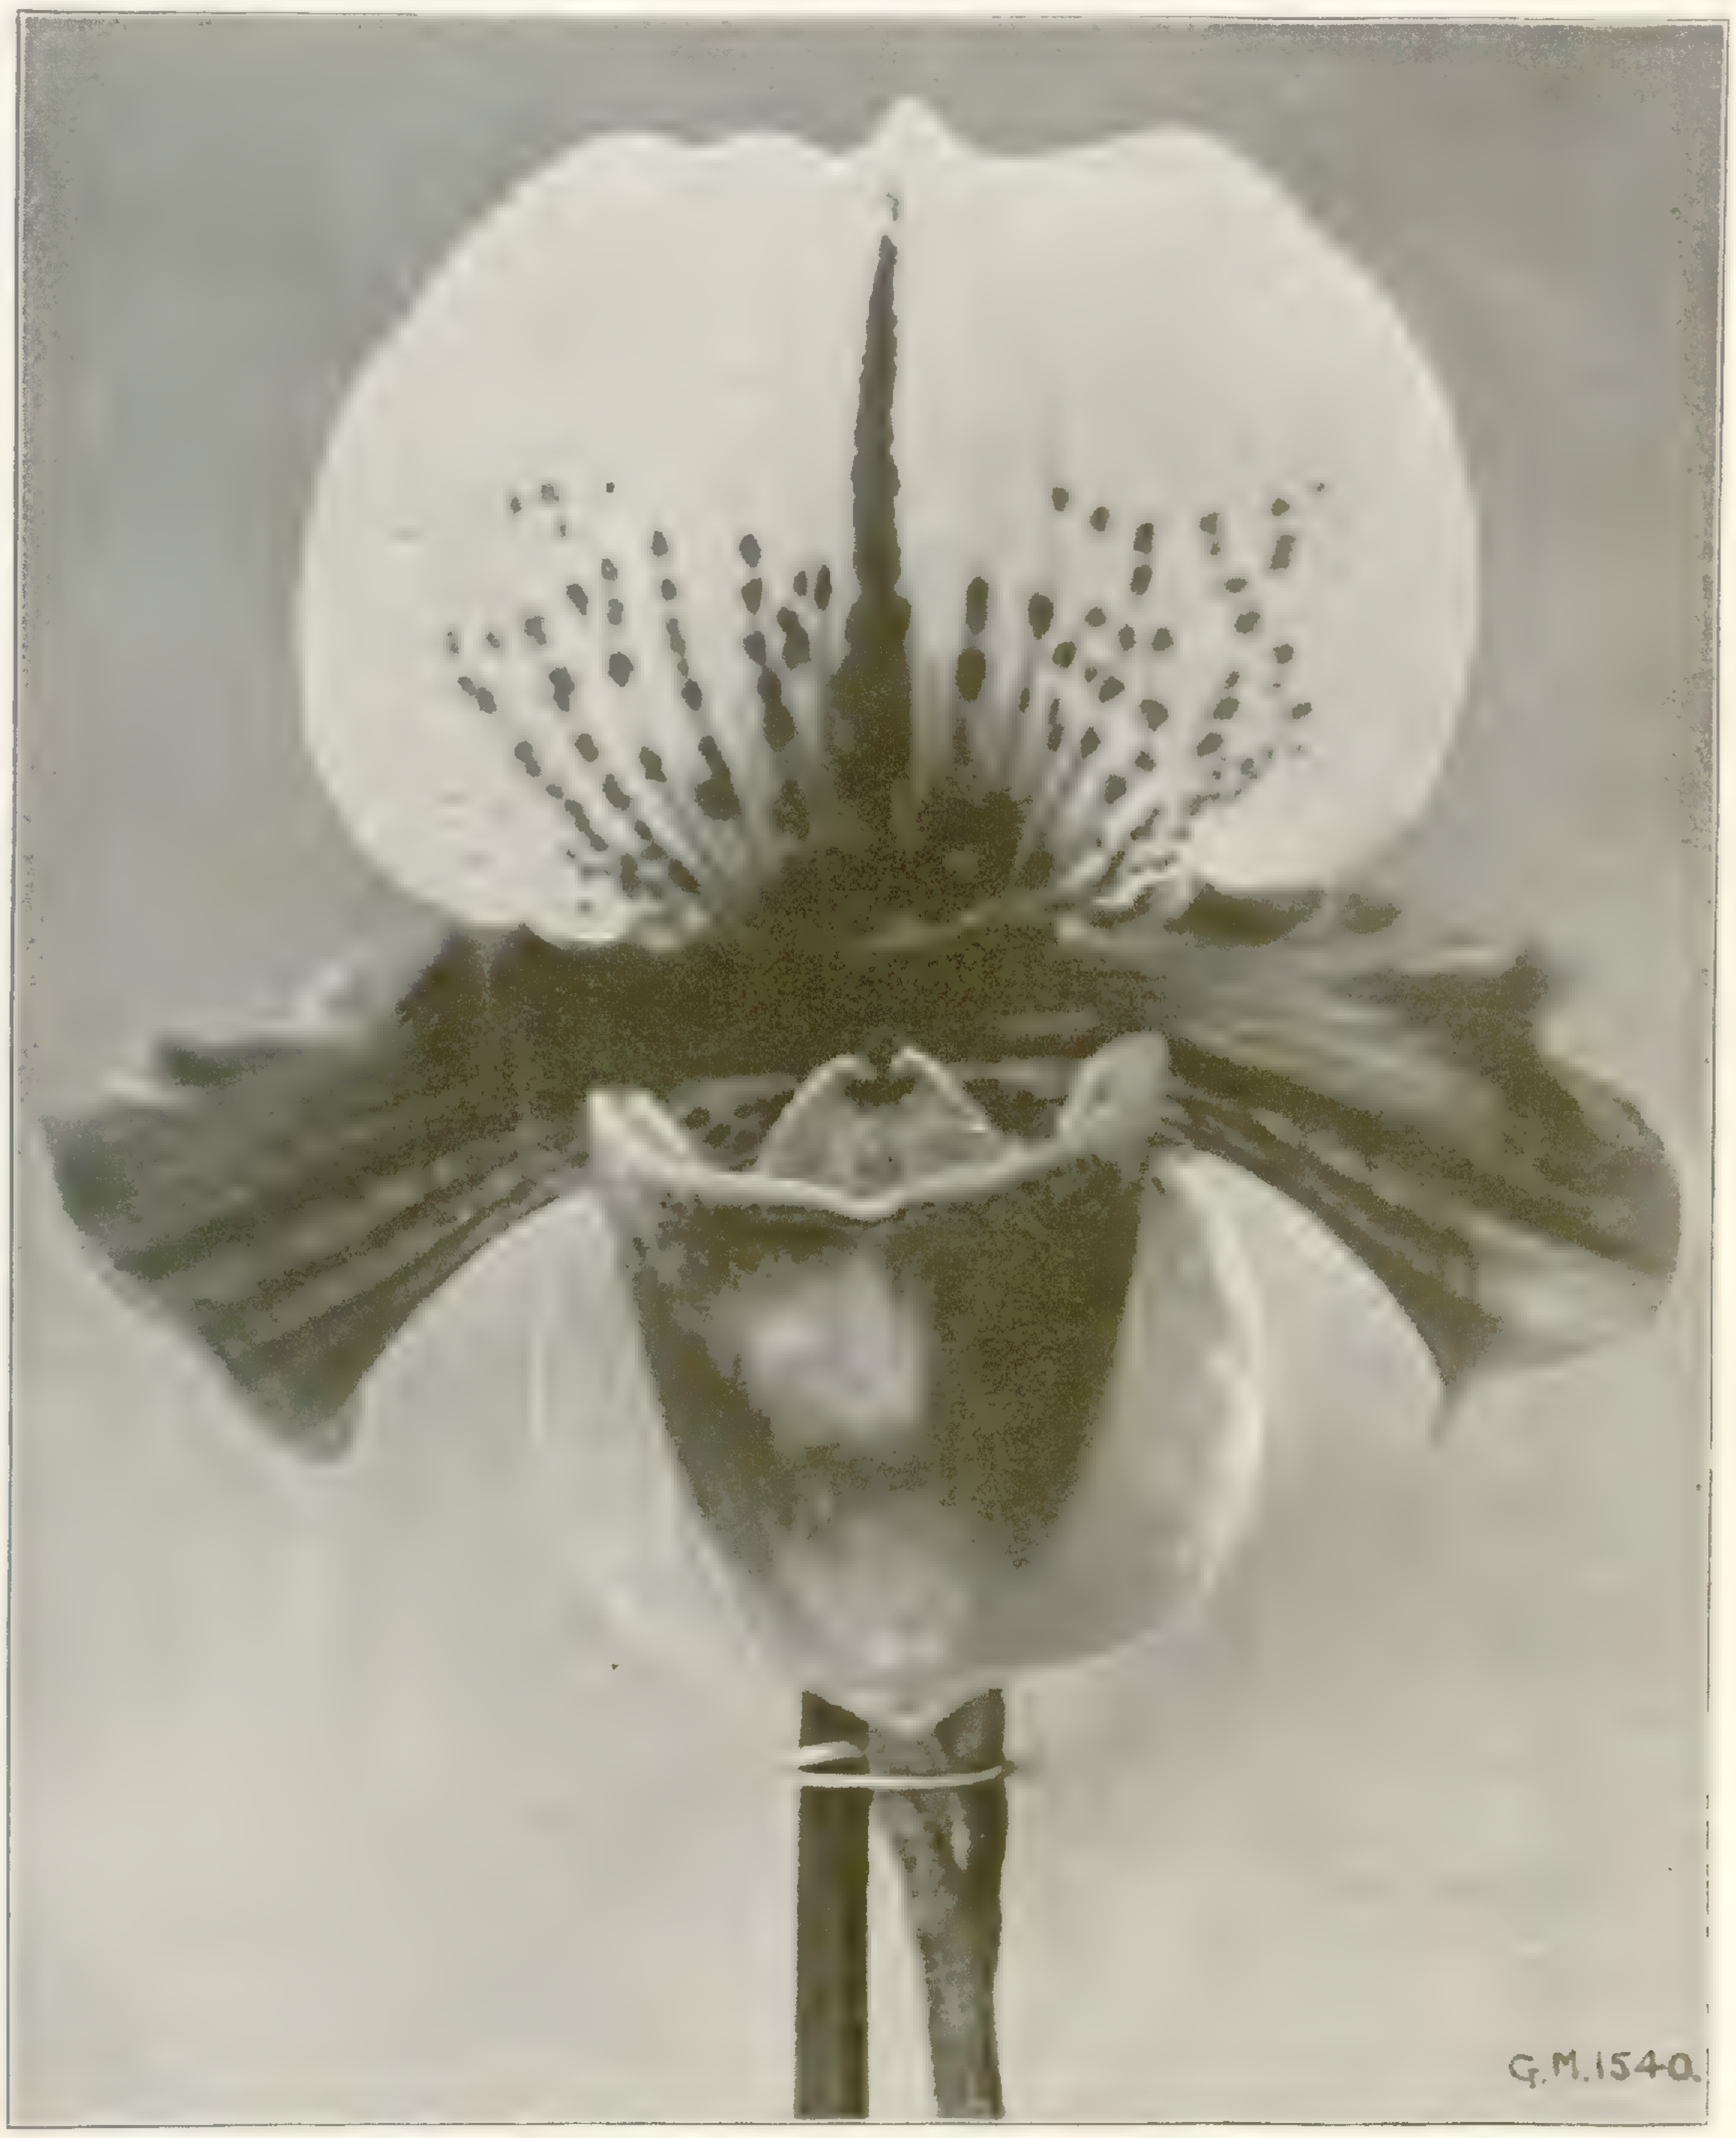
Women as Market Gardeners.—The annual meeting of the Women's Agricultural and Horticultural International Union was so well attended as to afford proof that there is continued interest in its work, and Mary Countess of Lovelace occupied the chair. Miss Brace, who is a pioneer in market gardening in Australia, stated that there was a profitable opening for women in the Commonwealth, provided they were properly trained and capable of hard work. Miss K. M. Courtauld related her experience in fruit farming in Essex, and assured the meeting that it could be made to pay if conducted efficiently. It was an appropriate occupation for women, since grafting, pruning, and budding were matters demanding deftness rather than strength, and required fingers used to delicate employment. She recommended beginning in a small way, with a sufficient amount of capital, and extending afterwards. The land should be near a good market or railway, but ground close to large towns was too expensive. Many practical hints were given by the speaker as to the management of the orchard, the destruction of insects, the selection of fruits that grew well in the locality, and packing for the market.

ROYAL HORTICULTURAL SOCIETY.

There was a remarkably good show at Westminster on November 22. The hall was well filled, and there was a large attendance of visitors during the afternoon, and all this was the more remarkable because of the sharp frosts of that and previous days, and the heavy fog of the same morning. Orchids were finely and extensively shown, and these, with chrysanthemums, winter-flowering begonias, carnations, and pelargoniums, made up the bulk of an interesting and very bright exhibition.

FLORAL COMMITTEE.

Very beautiful was the exhibit of winter-flowering begonias put up by Messrs. Jas. Veitch and Sons, Chelsea. The plants were all splendidly flowered, and their brilliant hues shone in the dull foggy light of the hall. The best varieties were Mrs. Heal, Winter Cheer, Elatior, Ensign, Agatha, and Mrs. Bedford. With these were batches of the orange-yellow-flowered Jacobinea chrysostephana, and bouvardias. A very large and bold group of single and decorative chrysanthemums was staged right opposite the entrance by Messrs. Jas. Veitch and Son, Chelsea. This served to show the great value of single varieties for late use, and also indicated their freedom, as the plants were in pots as grown. Cinnamon, Feltham White, Atair, H. M. Smith, Metta, Elusive, Sylvia Slade, Belle of Weybridge, Portia, Roupel Beauty, and Naomi were a few of the most attractive of the many beautiful single varieties staged. The elegance and freedom of the plants exhibited appealed to everyone.



CYPRIPEDIUM MINOTAUR.

Flower white, purple, green, and brown. F.C.C., R.H.S., November 22. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

Messrs. W. Wells and Co., Merstham, filled the greater part of one side of a table with chrysanthemums in variety, including big Japanese, incurved, single, and decorative varieties: Doris Stevenson, G. W. Forbes, Caledonia, Narcissus, Miss Hilda Wells, Arcturus, Metta, Merstham Jewel, and Mensa are a good selection of the single varieties shown by the Merstham firm. Mr. J. Box, Lindfield, had a small but pretty exhibit of chrysanthemums arranged with fern fronds in various receptacles.

Mr. T. Lilley, Guernsey, presented a collection of single chrysanthemums, and set up beautiful flowers of Mensa, the vivid crimson Arcturus, and a new rich red variety named Strawberry that was particularly bright and effective. The large plants of the new scarlet pelargonium His Majesty, shown by Mr. W. H. Page, Tangley Nursery, Hampton, were greatly admired, and they demonstrated very pleasingly the merits and brilliance of this variety for winter flowering.

A display of begonias of the Gloire de Lorraine section was made by Mr. J. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford; there were about a hundred plants in 48-sized pots, and all lightly trained into pyramid form; the type and the modern varieties, as well as the white form, were all represented. Mr. H. Burnett, Guernsey, presented a beautiful lot of carnation flowers in his usual style, and among fine varieties shown we noticed Mrs. C. F. Raphael, Mikado, R. F. Felton, Mrs. W. J. Hunter, Countess of March, and Mrs. H. Burnett. A dozen large and well-grown plants of Begonia Gloire de Lorraine, staged by Mr. F. Elvey, gardener to R. Foster, Esq., Summer Hill, Lindfield, were greatly admired as every specimen was smothered with blooms. Mr. Vincent Slade, Taunton, put up a small but very bright group of cut zonal pelargoniums. Golden Glory, Chavarris, Hermanos, Paul Reboux, M. Alf. Arckemer, Fascinator, and Comte de Roma were a few striking new semi-double varieties worthy of note.

Messrs. George Williams and Sons, Manor House Nurseries, Cardiff, filled a considerable space with single, Japanese, and decorative varieties of chrysanthemums; the singles were well shown, notably such varieties as Herbert Williams, Miss May Thorne, Sylvia Slade, Mrs. Hazelhurst, Brightness, and Caledonia. Mr. Martin Silsbury, Shanklin, Isle of Wight, submitted beautiful flowers of new Japanese chrysanthemums, D. B. Crane, Fred Green, Octopus, Hon. Mrs. Lopes, and Queenie Chandler. Mr. H. A. Thorp, Worthing, also showed new chrysanthemums.

A very handsome exhibit of chrysanthemums, made up of tall stands of big blooms and smaller stands of single and decorative varieties, all associated with ferns, asparagus, and other foliage, was put up in fine style by Mr. H. J. Jones, Ryecroft Nurseries, Lewisham. Some of the best things in this elegant and interesting group were Helena Williams, True Gold, Mrs. Hygate, Hon. Mrs. Lopes, Mrs. Faulkner, E. Jamieson, R. Hooper Pearson, Madame E. Rivol, Purity, Lady Francis Ryder, R. F. Felton, E. G. Mocatta (A.M.), a lovely soft yellow sport from E. Jamieson (grown by Mr. Thomas Stevenson, Addlestone), and Harry Mann; these are all Japanese varieties, but associated with a fine set of singles, representing the best varieties.

Begonias were finely shown by Mr. A. R. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge. Mr. Allan had one group of well-developed bush plants of B. Gloire de Lorraine, all nearly a yard across, while he filled the side of one table with very fine plants of Begonia Ensign, one of the newer hybrids with carmine flowers. There were about three dozen plants, and many of them 3ft. through. Mr. L. R. Russell, Richmond, submitted well-berried pernettyas, and once more showed how useful are small tree ivies, berried aucubas, and eleagnuses for various winter decorations.

A large miscellaneous group, tastefully arranged by Mr. Bradford, gardener to E. H. Brown, Esq., Highwood, Roehampton, was greatly admired by the general public. Palms, bamboos, ferns, and stove foliage plants were freely used, and flowering plants that went to make up the colour of the display included richardias, celosias, Begonia Gloire de Lorraine, bouvardias, streptocarpuses, browallias, Calanthe Veitchi, chrysanthemums in variety, cyclamens, carnations, poinsettias, Primula obconica, Roman hyacinths, lily of the valley, and anthuriums. A large exhibit came from Messrs. W. Cutbush and Son, Highgate, and it was in three parts. In the first section were perpetual carnations, well arranged and representing the best of the varieties, and some very fine new seedlings, one of these being a yellow-ground fancy, very heavily splashed with crimson scarlet. The next part was devoted to heaths, dracænas, aralias, and small palms, while the major portion of the grouping was composed of retarded (and forced) astilbes, Lilium speciosum, and L. longiflorum, grouped with ivies, araucarias, skimmias, aspidistras, etc.

A good exhibit of perpetual carnations was set up near the door by Messrs. Stuart Low and Co., Bush Hill Park, Enfield who had large stands of Lady Alington, Mrs. J. W. Riley, Marchioness of Linlithgow, Beacon, Colossus, O. P. Bassett, and Mrs. H. Burnett. The same firm submitted a small batch of cyclamens. A beautiful group of finely-grown nephrolepises, were shown by Messrs. H. B. May and Sons, Edmonton; herein were large specimens of N. Duffi, N. exaltata, N. todeaoides, N. exaltata grandiceps, N. Marshalli (very beautiful), N. Fosteri, N. splendens, N. Whitmani, N. multiceps, N. rufescens Mayi, and many other exquisite varieties.

ORCHID COMMITTEE.

A beautiful group of orchids, chiefly cypripediums, was staged by Mr. G. Day, gardener to H. S. Goodson, Esq., Fair Lawn, West Hill, Putney. Particularly fine were the three dozen or so of plants of the charming Cypripedium insigne Sanderæ, carrying three or four flowers each. Associated with these were C. insigne Harefield Hall, C. i. Luciani, C. Madame Jules Hye, C. Leeanum Clinkaberryanum, C. triumphans, and C. Arthurianum. In addition there were odontoglossums in variety, the beautiful Golden Fairlawn variety of Cattleya Venus, a fine form of C. Iris and Lælio-cattleya Myrrha var. Dayana. A very handsome group of cypripediums came from Messrs. James Veitch and Sons, Chelsea, and here there were fine flowers of C. insigne Sanderæ, C. Maudiæ, C. illustre, C. Euryades, C. Baron Schroder, C. Milo superbum, C. Iolanthe, C. Thalia splendens and C. Spicerianum.

A group made up entirely of the lovely Cypripedium insigne Sanderæ, and including one plant carrying a dozen blooms, was staged by Messrs. J. and A. A. McBean, Cooksbridge. Messrs. Jas. Cypher and Sons, Cheltenham, presented a fine group of orchids, and here cypripediums figured extensively, and included C. gigas Corndean Hall variety, C. Actæus, C. Baron Schröder, C. insigne Harefield Hall, C. i. Sanderæ, C. i. magnificum, C. Leeanum Corona, C. Rolfæ, C. triumphans, C. Vipani, and C. Thalia gigantea; Masdevallia tovarensis and Sophronitis grandiflora were also shown in this handsome group. Dendrobium Phalænopsis varieties were shown by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, who also staged the pretty Oncidium varicosum concolor, the green-flowered Liparis longipes, and Cypripedium insigne Sanderæ.

Messrs. Charlesworth and Co., Haywards Heath, had a very small group for them, but it included a fine plant of Brasso-cattleya Digbyano-Mendeli, Odontioda Devossiana with deep purple flowers; the fine Cypripedium Thalia gigantea, a finely-spotted Odontoglossum crispum, and Calanthe Burfordiense. Mr. Alexander, orchid grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester, brought up Cypripedium Minotaur, a superb hybrid between C. Euryades and C. Minsul; it has an immense white, dark-purple spotted dorsal sepal, and green and brown sepals and petals. Mr. Edward V. Low, Vale Bridge, Haywards Heath, brought up Cattleya labiata and a white form of it, Cypripedium Maudiæ, and two plants of C. Thalia.

From The Ridgeways, Haslemere, Mr. Hale, gardener to Samuel Larkin, Esq., brought up a few orchids that included a good specimen of Cattleya lucida with over thirty flowers, Oncidium ornithorhynchum, Cypripedium insigne Sanderæ, Odontoglossum Harryanum, and Cymbidium Traceyanum. A large exhibit of orchids was made by Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford. The display consisted chiefly of fairly large plants of Cypripedium insigne type, with C. i. Sanderæ, C. i. Harefield Hall, C. Leeanum, C. Baron Schroder, C. A. de Lairesse, C. villosum, Lycaste Skinneri, and Odontoglossum crispum.

Cypripedium Charlesworthi Téméraire (F.C.C.), with a very big wavy dorsal sepal, was shown by Messrs. Sander and Sons, St. Albans, together with Chondropetalum Fletcheri (Chondrorhyncha Chestertoni x Zygopetalum Mackayi), and Vanda cærulea var. Sanderæ (F.C.C.), with rosy instead of blue colouring, this being deepest on the petals, while the lip is rich rose-red. A beautiful and novel variation from the type. Mr. R. G. Thwaites, Streatham Hill, sent a fine form of Cattleya Maggie Raphael, and Odontioda Charlesworthi. Colonel Carey Batten, Leigh Lodge, Abbotsleigh, Clifton (gardener, Mr. Spewage), showed a fine branching spike of Oncidium tigrinum and a small home-raised seedling of Cypripedium callosum Sanderæ. Calanthes were well shown by Mr. Hunt, gardener to P. Ralli, Esq., Ashstead Park, Leatherhead; there were three or four spikes on some plants, especially on C. Wm. Murray; these made up a very pretty group.

FRUIT COMMITTEE.

Mr. Whittle, gardener to Lieut.-Colonel A. C. Borton, Cheveney Hunton, Maidstone, showed some remarkably fine apples, clean, of good size, and finely coloured; especially fine were Cox's Orange Pippin, Ribston Pippin, Warner's King, Gascoyne's Scarlet, Bismarck, Mabbott's Pearmain, Lane's Prince Albert, Annie Elizabeth, Cox's Pomona, Rival, Lord Derby, Emperor Alexander, Peasgood's Nonsuch, and Vicar of Beighton. Some deeply coloured bunches of Alicante, Appley Towers, Gros Maroc, Gros Colmar, and Muscat of Alexandria grapes, three bunches of each, were shown by Mr. Lintott, gardener to Sir Walpole Greenwell, Bart., Marden Park, Woldingham.

Mr. W. Poupart, Richmond, brought up a few dozen of bottled fruits, showing fine fruits, finely bottled, and looking particularly appetising. Endives in great variety were brought up from the Society's Trials at Wisley, and such varieties as White Curled, Moss Curled, and the various forms of Batavian endive were very good. Mr. T. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, sent up some splendid specimens of Smooth Cayenne pineapples.

MEDALS.

Silver-Gilt Flora.—To Mr. Allan, gardener to Lord Hillingdon, Uxbridge, for winter-flowering begonias; to Mr. Bradford, gardener to E. H. Brown, Esq., Highwood, Roehampton, for group of plants; to Messrs. H. J. Jones, Lewisham, for chrysanthemums; to Messrs. Jas. Veitch and Sons, Chelsea, for chrysanthemums and begonias; to Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, for orchids.

Silver-Gilt Knightian.—To Mr. Whittle, gardener to Colonel Borton, Cheveney, Hunton, for apples.

Silver-Gilt Banksian.—To Messrs. H. B. May and Sons, Edmonton, for group of nephrolepises.

Silver Flora.—To Messrs. H. Cannell and Sons, Swanley, for pelargoniums and chrysanthemums; to Messrs. W. Cutbush and Son, Highgate, for carnations, etc.; to Mr. J. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford, for begonias (and also one for orchids); to Messrs. W. Wells and Co., Merstham, for chrysanthemums; to Messrs. Jas. Veitch and Sons, Chelsea, for orchids; to Messrs. Jas. Cypher and Sons, Cheltenham, for orchids.

Silver Banksian.—To Messrs. J. and A. A. McBean, Cooksbridge, for cypripediums; to Messrs. Stuart Low and Co., Bush Hill Park, Enfield, for orchids; to Mr. Hale, gardener to S. Larkin, Esq., Haslemere, for orchids; to Mr. Hunt, gardener to P. Ralli, Esq., Ashstead Park, Leatherhead, for calanthes; to Mr. H. Burnett, Guernsey, for carnations; to Mr. R. Foster, Lindfield, for begonias; to Mr. W. H. Page, Hampton, for pelargoniums; to Mr. L. R. Russell, for shrubs.

Silver Knightian.—To Mr. T. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, for pineapples.

Bronze Banksian.—To Earl Stanhope, Sevenoaks, for Plumbago rosea.

CERTIFICATES AND AWARDS.

First-Class Certificates.—To Messrs. Sander and Sons, St. Albans, for Vanda cærulea Sanderæ, and for Cypripedium Charlesworthi var. Téméraire; to Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester, for Cypripedium Minotaur.

Award of Merit.—To Cypripedium Iolanthe, from Messrs. Jas. Veitch and Sons, Chelsea; to Cattleya lucida, from S. Larkin, Esq., Haslemere; to Japanese Chrysanthemum Ernest G. Mocatta, from E. G. Mocatta, Esq. (gardener, Mr. T. Stevenson), Woburn Place, Addlestone; to Japanese Chrysanthemum D. B. Crane, from Mr. Martin Silsbury, Shanklin, Isle of Wight; to Single Chrysanthemum Strawberry, from Mr. S. Lilley, Guernsey; to Japanese Chrysanthemum William Turner, single chrysanthemum Sandown Radiance, and semi-double chrysanthemum Crimson Jewel, from Messrs. W. Wells and Co., Merstham; to single chrysanthemum Mrs. Foot and Peter Plant, from Mr. Lawrence, Shoreham; to single chrysanthemum Brightness, from Messrs. Williams and Son, Cardiff; and to incurved chrysanthemum Ethel Thorp, from Mr. H. Thorp, Worthing.

NOTES FROM SCOTLAND.

◆

Autumn Weather and Vegetation.

The comparatively dry and pleasant weather that prevailed throughout the greater part of September and October gave way to a severe storm of wind and rain in the closing hours of the latter month. This appears to have been the precursor of complete atmospheric change, as since then frosts of considerable severity and showers of hail and snow have been of almost daily occurrence. Upon the distant hills the latter lies to some depth in the corries, but to a lesser extent upon the more exposed wind-swept portions, which, as viewed from the lower levels, produces an impressive, or what perhaps might be more fittingly described as majestic, effect when the whole landscape is illumined with bright sunshine, over which the slowly-moving shadows of light fleecy clouds chase each other in irregular succession.

Autumn Flowers.

It 's seldom that the more tender kinds of decorative plants remain so long unharmed by frost, and maintain at least some portion of their beauty, as has been the case this year. To the close of October dahlias were quite fresh, and, although their flowering capabilities were well-nigh exhausted, a very fair show of blossoms was in evidence.

The same remark applies to most kinds of bedding-out plants, as heliotrope, mignonette, lobelia of the herbaceous class, marguerites, verbenas, and lastly, Calceolaria amplexicaulis, which for late flowering is still the best of the family, and produces a full display long after the more shrubby kinds are past their best.

Marguerite Carnations.

The season has suited these, as the plants grew strongly, and an abundance of flowers and buds in various stages of development have been available for a long time. Coming into beauty as these do just at the time the border varieties are getting past their best, their usefulness for display or for cutting for decorative purposes in rooms, together with the ease with which their successful cultivation is carried out, should ensure for them more favour than appears to exist at present.

Sweet Peas and Roses.

The former have done unusually well, and the freedom enjoyed in this part from wind storms allowed of the growths remaining erect and productive of excellent flowers until a very late period. Roses, too, have flowered well, many of the blooms being equal in form and colour, and considerably more lasting than were others in the height of the season. In this respect the hybrid tea varieties take precedence, some of the best late flowering being Caroline Testout, Gustave Grunerwald, Vicountess Folkestone, Madame Abel Chatenay, Lady Ashtown, and Pharisaer. China roses in variety, but more particularly the well-known blush, that blooms more or less throughout the late summer and autumn, are very useful when most other denizens of the garden are past, and withstand several degrees of frost with impunity. Among climbing roses the rambler section easily takes the lead, and such varieties as Lady Gay, Hiawatha, Dorothy Perkins, and the white counterpart of the latter, all flower with some freedom long after most others are past.

Berried Plants.

The display of coloured fruits is this year very scanty, and even the commoner forms, as the hollies and the thorns, are no exception. The Spindle Tree (Euonymus latifolia) is the only species profusely laden with berries, and some plants of this ten feet or more in height, are beautiful objects at present, the foliage being naturally reduced in amount, but with sufficient remaining to form a slight background to the long racemes of scarlet fruits just now—mid-November—beginning to burst, and thus show the orange-tinted seeds and interior.

Fine Foliaged Trees.

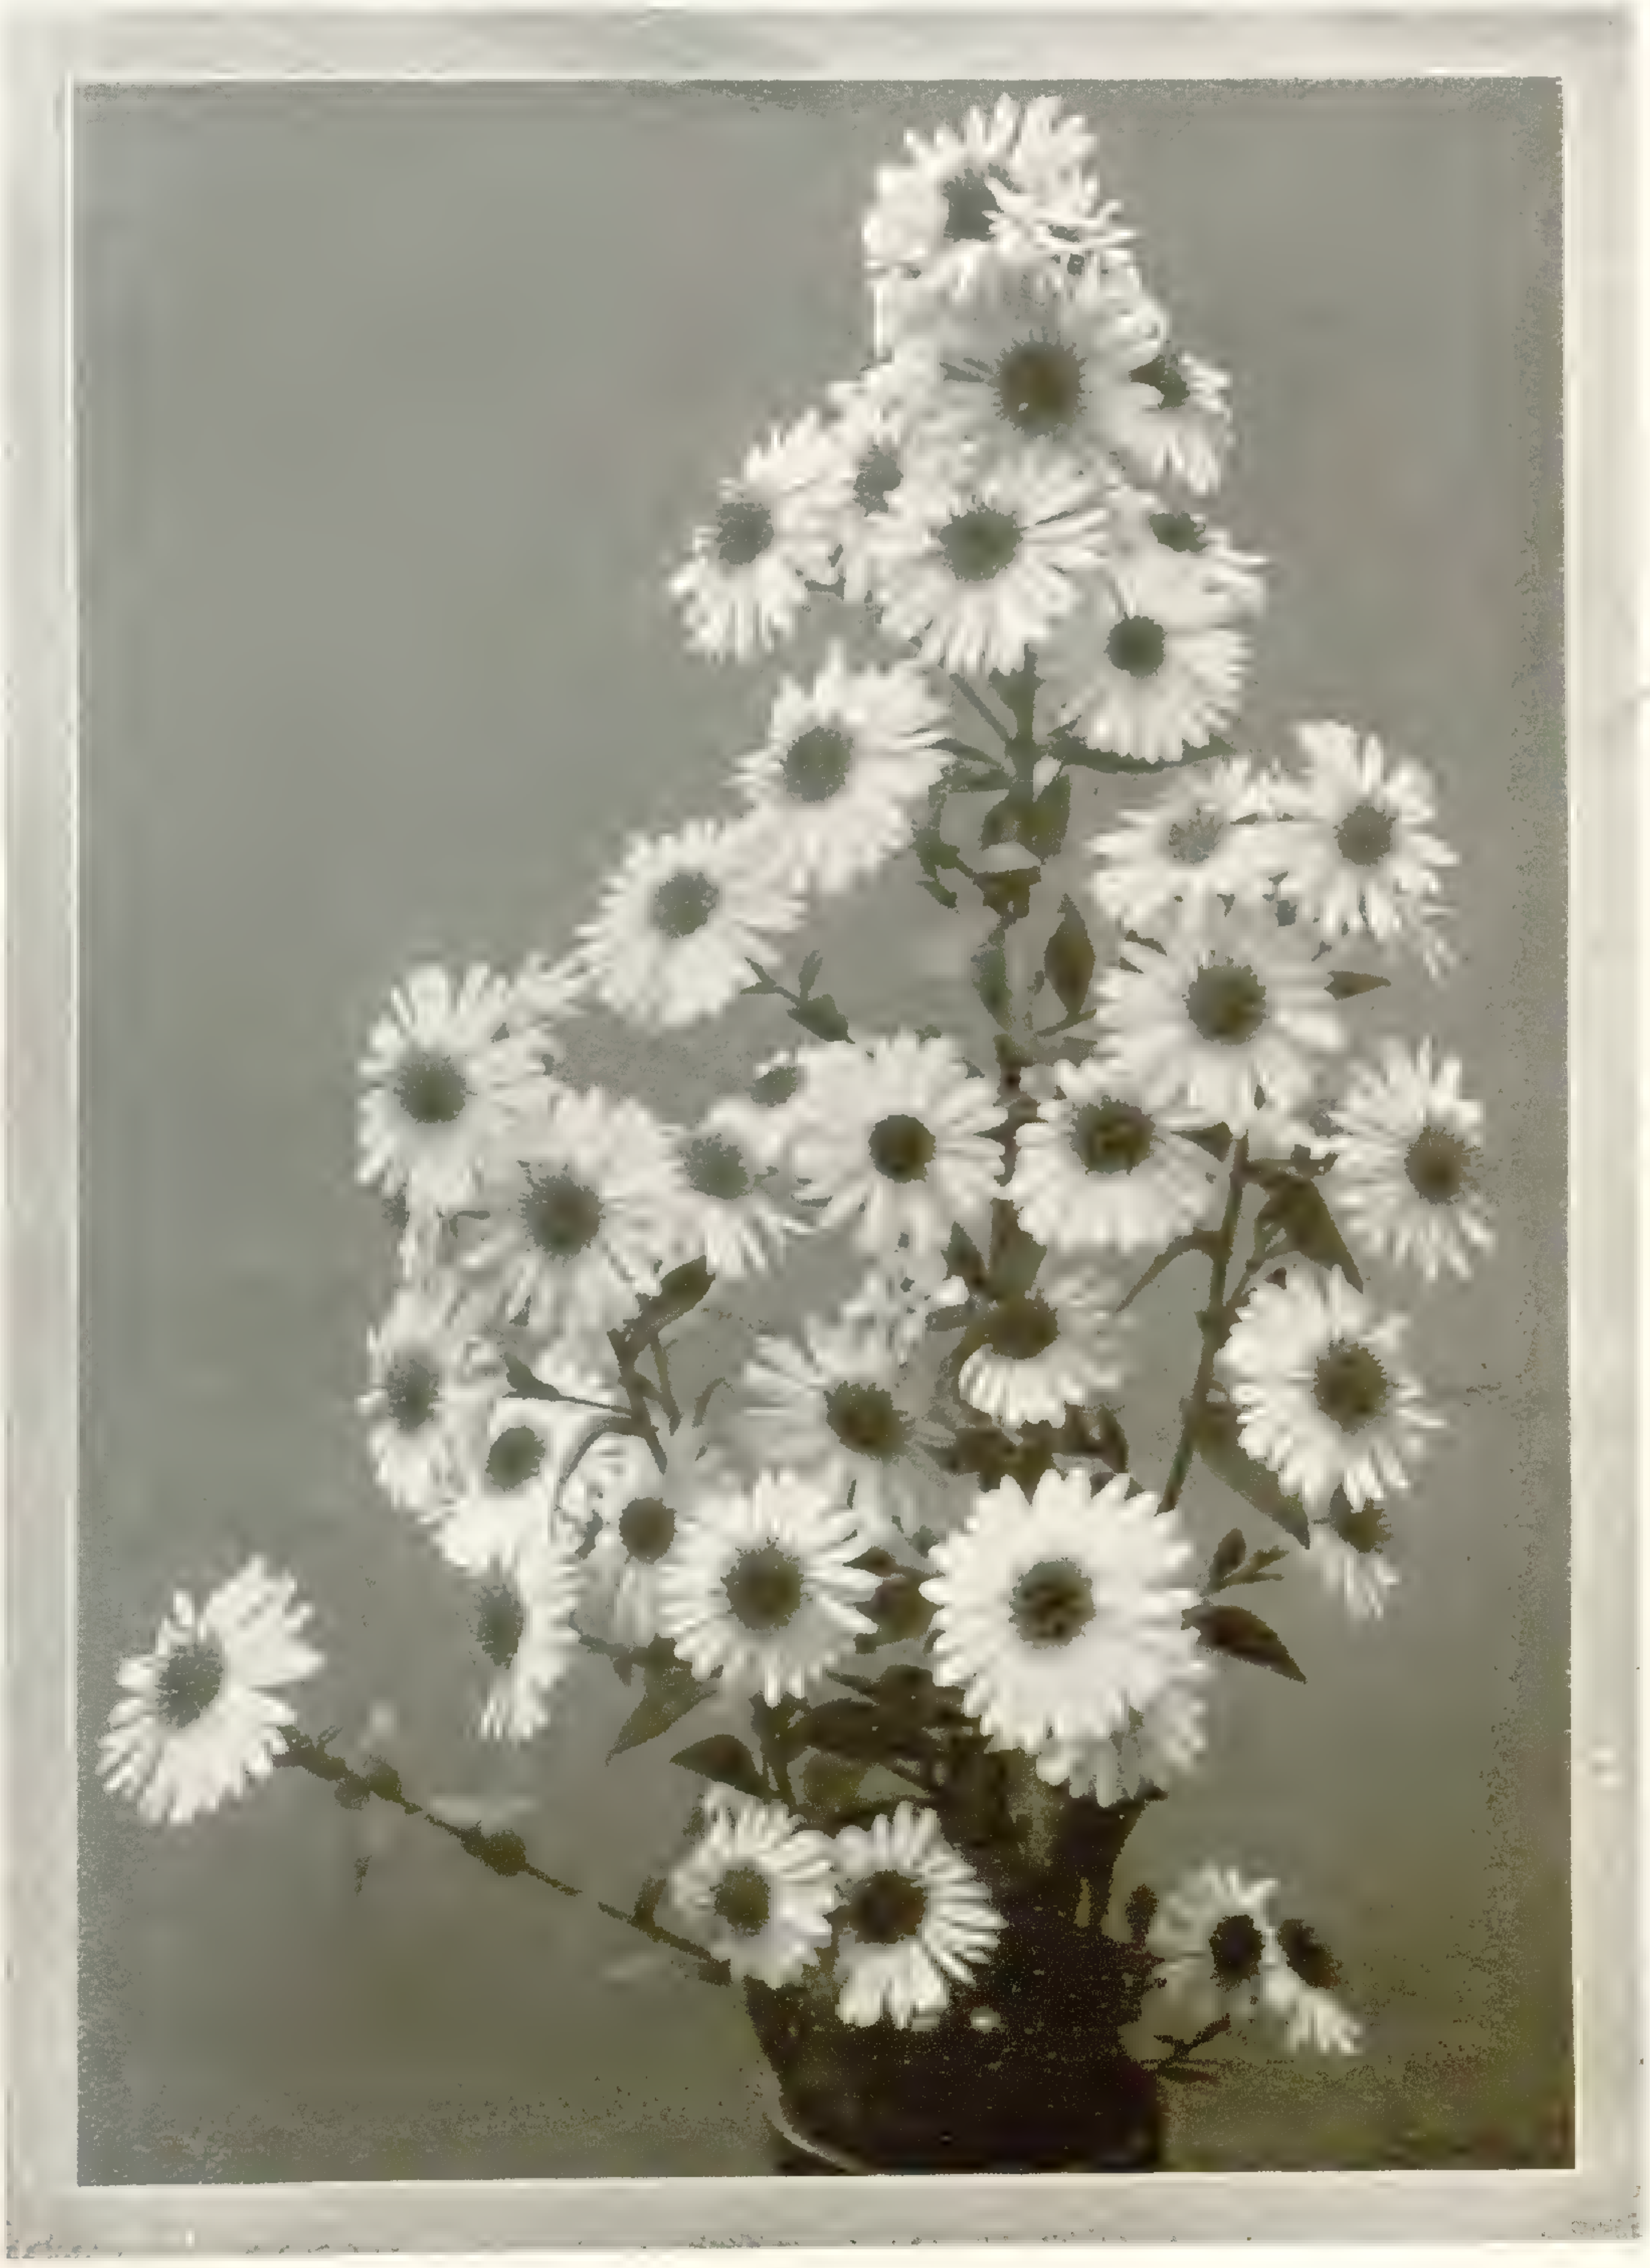
The weather referred to has had a most beneficial effect upon the trees, and, although many, as chestnuts, limes, thorns, etc. (with the exception of Prunus pissardi), are now past, the oaks and beeches still retain a great portion of their foliage, and some specimens of the last-named, of great height and spread of branch, are objects of great interest and beauty. The common oak, though less brilliant in colour, is not without interest, while some of the American forms of the genus are unsurpassed in this respect, and furthermore retain their foliage for a very long period, sometimes for the greater part of the winter, if growing in positions where not exposed to strong blasts of wind.

James Day.

Galloway House, Wigtownshire.

ASTER CLIMAX.

One of the very finest perennial asters or Michaelmas daisies yet raised is the one named Climax. It does not follow that Mr. E. Beckett has arrived at the non plus ultra of aster raising, but, so far as garden decoration is concerned, there is not at present a bolder, stronger-growing, more effective or more beautiful variety than the one here figured. Not only has the variety the good qualities indicated, but it carries its large flowers in great abundance, and these are so shapely that they commend themselves to the most exacting floriculturist. The colour is soft blue, a very pleasing and effective shade. The free-branching and elegant habit of the plant is all that can be desired, and a border that lacks this variety lacks one of the most beautiful of late autumn flowers. In height the plant reaches about six feet, and is well furnished with bold, roundish foliage. Messrs. W. Cutbush and Son, Highgate, N., have shown this variety remarkably well during the autumn, and the illustration represents a spray shown by them in mid-October. We may add that Aster Climax received an Award of Merit from the Royal Horticultural Society in the autumn of 1908, and that it is a plant every lover of hardy plants should possess.



ASTER CLIMAX.

A handsome variety, with flowers of a soft blue colour. From a spray exhibited by Messrs. W. Cutbush and Son, Highgate.

DECORATIVE EVERGREENS FOR WINTER EFFECT.

The value of foliage masses in the garden is always most apparent in winter, when few other interests compete with them, as at this season they impart to the garden an appearance of cheerfulness and life that softens our first great loss occasioned by the autumn fall. With shrubs in particular, their variety produces a group so great that gardens of any extent, and offering every condition of soil and aspect, may readily gain in character by a judicious selection of the best. Nor can we overlook the importance of evergreen foliage amid the lighter, softer shades so typical of summer leaves; this element of contrast, while generally present, is rarely given due allowance when dissecting those features in a composition that most directly appeals to us.

APPLE WORCESTER PEARMAIN.

The primary idea in the use of evergreens should be that of imparting life, beauty, and interest to the garden during those months when deciduous plant life is for all practical decorative purposes inoperative. As already hinted, the scope for selection is practically unlimited, therefore choice should be directed to the best and most distinct, and obviously, when the flowering season occurs within the winter period, due preference should be given to these.

It is interesting to note the position of Viburnum tinus, a plant so easy to propagate, inexpensive to procure, and succeeding under the most trying circumstances, that for no other reason it is often relegated to neglected corners or planted under trees, while it is also equal to any evergreen for town gardens, yet it is probably the finest evergreen winter-flowering shrub we have, forming a conspicuous object while the flower heads are in bud, and marvellously beautiful when draped in the snowy mantle of expanded flowers. It rather suffers, I think, from over-production and an easy-going character, as plants of far less intrinsic merit are frequently preferred before it, whereas, given an open position in any ordinary garden soil, it will more than repay this scanty favour. Viburnum tinus lucidum is the best form, having broad, glossy green leaves, and the variety French White is the best flowering variety of this. Arbutus Unedo and its varieties, under favourable conditions, attain to tree-like dimensions, and they combine beauty in leaf and stem with that of flower and fruit. From the apparent resemblance of these latter to the strawberry the tree has commonly been spoken of as the strawberry tree. Arbutus is a member of the Ericaceous family; the flowers are small inverted bells, with contracted mouth, and borne in small branching sprays resembling lily of the valley spikes. It succeeds on a greater variety of soils than any other genus of ericaceous plants, as this includes limestone and chalk, upon which the trees make healthy, if not over-vigorous, growth. Arbutus Unedo coccinea is a conspicuous variety to grow for the brightness of the bark, while the type should always be given a place for its ruddy-coloured fruits.

Andromeda is another Ericaceous genus, also remarkable for floral beauty, but demanding as an essential condition a soil entirely free from lime. Andromeda floribunda, the commonest species, is an exceedingly neat shrub, covering itself with flowers, at first greenish coloured throughout winter, that in spring develop into racemes of cream-white blossoms, bearing striking resemblance to miniature sprays of lily of the valley. Andromeda japonica is a choicer, more desirable plant, as, in addition to the floral beauty, the young leaves and shoots art exceedingly delicately coloured red and pink, and when grouped in quantity the effect is particularly good. A. formosa is larger in all its parts than A. japonica, ultimately developing into tree-like proportions; it requires a sheltered, favoured spot as spring frost at times damages the young growths when rapidly thawed by sunshine. Its beauty when in flower equals anything found among hardy shrubs, and the young shoots and leaves exhibit a rich shade of reddish-scarlet. A. (Zenobia) cassinifolia differs in habit from the foregoing; the branches are lighter and more pendulous, and, in consequence, the plant is less stiff. The flowers are very freely produced in the form of pendulous white bells, and they continue in beauty for some considerable time. The foliage in this species is also distinct, being a rich deep shade of blue-green; in the latter respect it is, however, surpassed by the variety pulverulenta, a form having leaves of an intense shade of glaucous grey-green that render it at once conspicuous at any season. The flowers resemble the type in general character, being, if anything, larger and more freely produced. Andromeda Rollissoni is dwarfer, but an ideal plant to group in mass; the flexible shoots arch in a graceful manner, and when these are crowded with pure white bell-shaped flowers the effect is altogether a charming one. At all seasons, but more particularly in the young state, the leaves and shoots are tinted with varying shades of red and purple.

Of winter evergreens effective for leaves and fruits the holly takes precedence. It succeeds on a great variety of soils, and few hardy plants equal hollies in their glossy greens, variegations, and countless forms. In the majority of instances, where a garden can be lightened by variegated shrubs, the holly should have pride of place. Ilex argentea marginata is the best silver holly, and of equal merit in shades of gold is Golden Queen; a conspicuous plant is fructo-lutea, with yellow berries. I. ferox and its coloured forms are curiously interesting, with twisted margins and innumerable spines. I. scotica is a charming holly, with sinuate margins entirely free from spines. I. japonica latifolia is a good, if somewhat tender, Japanese kind, for walls; the leaves are dark green.

The berberis family contains many fine evergreens, B. Darwini being one of the first to flower, and, although an old garden plant, is still one of the best. The same remarks apply to B. japonica, one of the most distinct, having stout stems supporting the leaves in whorls that in spring become surmounted by huge trusses of yellow flowers. B. stenophylla, B. Wallichiana, and B. Knighti are among the most desirable of garden plants in this large genus.

Escallonia Langleyensis develops into a specimen some eight feet high, the plant becoming a spreading bush, with graceful arching branches that, in bloom, appear a drooping cascade of blossom, the flowers being cherry-red in colour. In marked contrast to other evergreens is Garrya elliptica; in many districts it succeeds in the open, and when the flowers expand the plant produces a unique effect among other shrubs. Olearias yield a group of shrubs which have evergreen leaves more or less covered with a white tomentum, generally on the undersides, and as the young shoots exhibit the same character the general appearance is that of grey-green leafage.

Azara microphylla is an ideal evergreen for a limestone soil; the tree is exceedingly graceful in habit, and is densely clothed with small, dark green, toothed leaves of exceptionally glossy appearance. Osmanthus ilicifolius purpureus forms a graceful bush with holly-like leaves that are brightly tinted with purple in the young stage. Photinia serrulata is very distinct in leaf and colour, and a most valuable acquisition for a position on a wall.

BY APPOINTMENT. BY APPOINTMENT.

CHEAP OFFER TO CLEAR.

We beg to inform our numerous clients that we have secured a large tract of land adjoining one of our principal Nurseries, and that it is our intention to clear the Stocks off some of our outlying branch Nurseries at a sacrifice.

Everything has been grown with our usual care, and offered in Lots, subject to being unsold; we guarantee the numbers and quality of each Lot offered.

Particulars of above, together with our General Catalogue, will be sent on application.

JAMES SMITH & SONS (Nurserymen to H.M. THE KING), **DARLEY DALE NURSERIES, near MATLOCK.**

Inspection cordially invited. Visitors met by appointment at Darley Dale or Matlock Stations.

GOLD MEDAL ROSES

WILLIAM LOWE'S

BEESTON ROSES

ARE THE BEST.

For all Soils and Situations.
Roses for Exhibition.
Roses for Pergolas.
Standard and Bush Roses.
Roses for Garden Decoration.
Pillar Roses. Climbing Roses for Walls.
Old and New and all the Best Roses.

All are magnificent plants, and the best value for money obtainable.

Also a grand lot of

FRUIT TREES, ORNAMENTAL TREES, SHRUBS, etc.

Intending Planters should come and inspect my stock of HOLLIES and EVERGREEN SHRUBS of all descriptions.

30 Minutes' walk from Beeston Station,
Send for Catalogue, Post Free on Application.

New Late-Fruiting Raspberry,

DANN'S MONARCH.

AWARD OF MERIT at the Eastbourne Horticultural Society's Show, Nov. 2nd, 1910.

This is without doubt the finest Autumn Fruiting Raspberry ever sent out, being a dessert berry of splendid flavour and very large, almost as large as the strawberry. It is an enormous cropper and very hardy. It commences to ripen in August and continues in fruit, if the weather is mild, until December in the open. 115lbs. of fine berries were picked from my canes the last week in October this year.

Well-rooted Planting Canes, 15/- per doz.; **£5** per 100 Free on rail. Cash with order.

FROM **A. E. DANN,**
Fruit Grower,
Oaklands, HAILSHAM, Sussex.

TWO GOOD APPLES.

◆

Apple King of the Pippins.

There appears to be some confusion as to which is the correct name of the apple here illustrated. King of the Pippins, as described by Dr. Hogg, is an early rich-flavoured dessert apple, in use during August and September, whereas the apple here portrayed is not in use until the first week in November, or occasionally it may be ready, in warmer and drier localities with a sandy soil, in October. This apple is described by Dr. Hogg as Golden Winter Pearmain, synonymous with King of the Pippins, Hampshire Yellow, and Jones's Southampton Pippin. Let the name be as it may, the apple here illustrated is well known as King of the Pippins, both at shows and in the market, and is distinctly popular. In point of quality it varies considerably: in warm loamy soil it is really quite first-rate, but in soil of a heavy retentive character, where the growth is slower, the flesh is liable to be hard, and does not possess that brisk spicy flavour which is naturally characteristic of it, and renders the variety so much sought after where it succeeds. In all markets that I am acquainted with it finds a ready sale, and at a good price, because it is in season at a slack time, just before Cox's Orange Pippin, Blenheim Pippin, and Ribston Pippin are fit for use.

Dr. Hogg says it will grow in almost any situation, but that is not my experience, except at considerable expense and labour in deep trenching and the addition of lightening materials where the soil is heavy, cold, and retentive of moisture, and, consequently, naturally cold in the spring. In such a soil, without extra deep trenching and the addition of light soil, I do not advise the planting of this apple largely, as the tree is liable to canker, and does not grow with the freedom desirable in a market apple.

In light and naturally warmer soil King of the Pippins is a most desirable variety, as it crops freely, and grows to a good size. I have noticed another point in favour of this apple. The small fruits possess equal flavour with the larger ones, and that is not a common occurrence in apples. As a standard, bush, pyramid, espalier, and especially as a cordon in the open, King of the Pippins succeeds, and is perhaps more favoured by the thinness of branches than almost any other variety, as it crops so freely on spurs on the main branches. The point then is to furnish the trees as quickly as possible with a sufficient number of branches, and then induce them to form spurs in quantity by summer pruning, thereby exposing the wood to the favourable influence of light and air.

No apple that I know pays better for the time spent in thinning the fruit, as that remaining grows so evenly.

Worcester Pearmain.

This early dessert apple is a general favourite, in the market especially, where its bright colour is an attraction. It comes into use at a time—September—when there is a dearth of good dessert fruit. The earliest varieties, as Mr. Gladstone, Quarrenden, Irish Peach, and the June-eating, have disappeared. From a market point of view I look upon Worcester Pearmain as quite the best of the early apples, and, as far as I know, it succeeds pretty well in most localities. I do not suggest that in a low-lying wet district, especially where the soil is a heavy clay, that it would succeed as well as in a higher, drier district, and in a loamy soil. Wherever it does succeed I would advise it being planted largely, because it fills a gap in the market at an important time of the apple season.

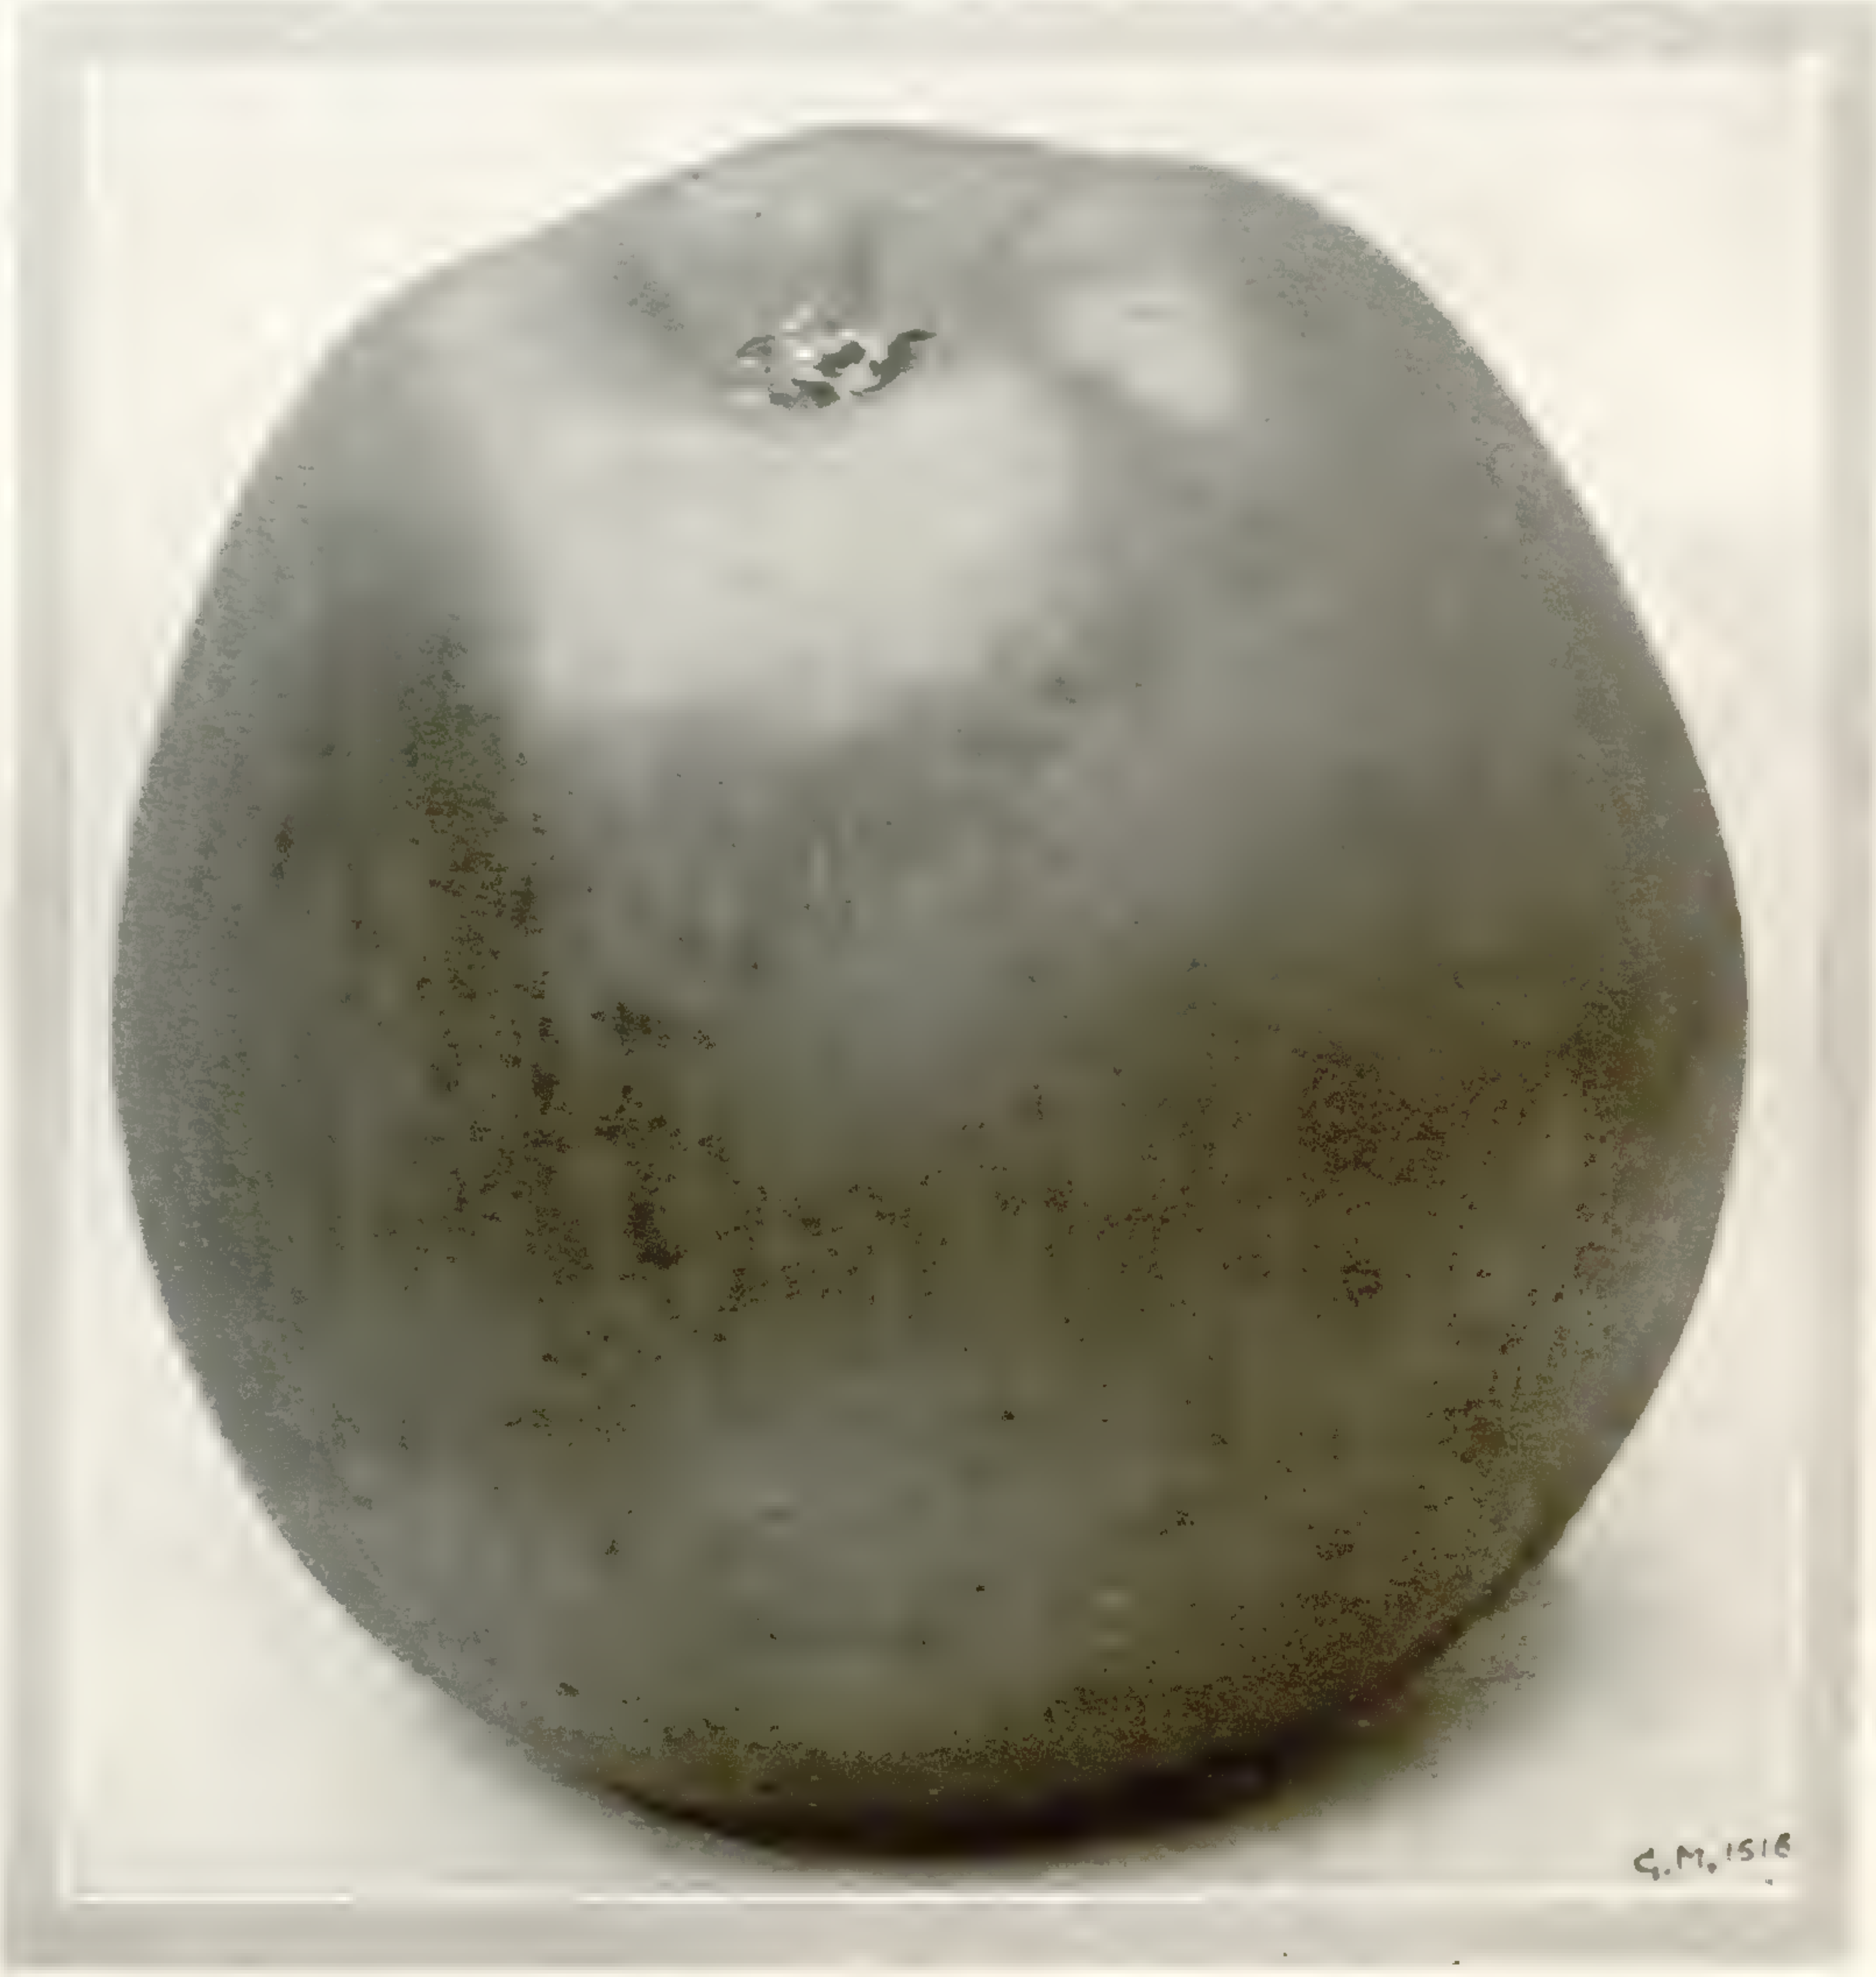
Worcester Pearmain is a seedling from Devonshire Quarrenden, and was sent out by Messrs. R. Smith and Co., of Worcester, in 1873. I planted at Swanmore, in 1878, one of the first grown standard trees of it, and I must say it has cropped constantly ever since. Although growing vigorously during the first fifteen years after planting it does not make such rapid progress afterwards. As a standard, bush, pyramid, espalier, cordon, or as a wall tree it is quite desirable, succeeding in any form. For the small garden it is of much value, not needing so much space as many varieties, and, being such a constant cropper, is all the small grower desires.

To obtain the finest fruit manurial aid is required, especially for trees over ten years old. This may be given as a top dressing—mulching in the summer—or some desirable artificial stimulant worked in amongst the surface roots. A method of pruning that admits an abundance of light and air to the branches should be adopted to ensure the high, rich colour of the fruit so important from a market point of view, and also the flavour, for the richest coloured fruits possess the finest flavour.

Summer pruning of vigorous growing bush trees is time well spent, the point being to keep the centre of the tree quite open. In the case of standards that have their main boughs thinly disposed little will be required in the way of pruning, as I do not find that standards do make so much growth as bushes. Some of the finest crops of fruit I have seen of this apple were in the gardens at Sandringham, where the thinly-trained bush trees were heavily laden with richly coloured fruit of large size.

Another advantage I find in this early apple is the fact of its fruit keeping much longer than do the majority of early varieties. Fruit carefully gathered will remain quite good till the early part of November. Dr. Hogg describes Worcester Pearmain thus: Fruit, medium sized, two and three-quarter inches wide, the same in height, conical, even, and very slightly angular towards the crown, where it is narrow. Skin very smooth, and completely covered with a brilliant red, dotted with fawn-coloured freckles. Eye, small, closed. Flesh, very tender, crisp, very juicy, and sprightly, with a pleasant flavour. With this description I agree, and I would impress upon planters that it does not possess so high a flavour as some, but in the case of an early market apple its high colour is of primary importance. The attractive colouring of the fruit renders it most useful for dessert, and the flavour, if not rich, is sufficiently pleasant to ensure it being fully appreciated.

E. Molyneux.

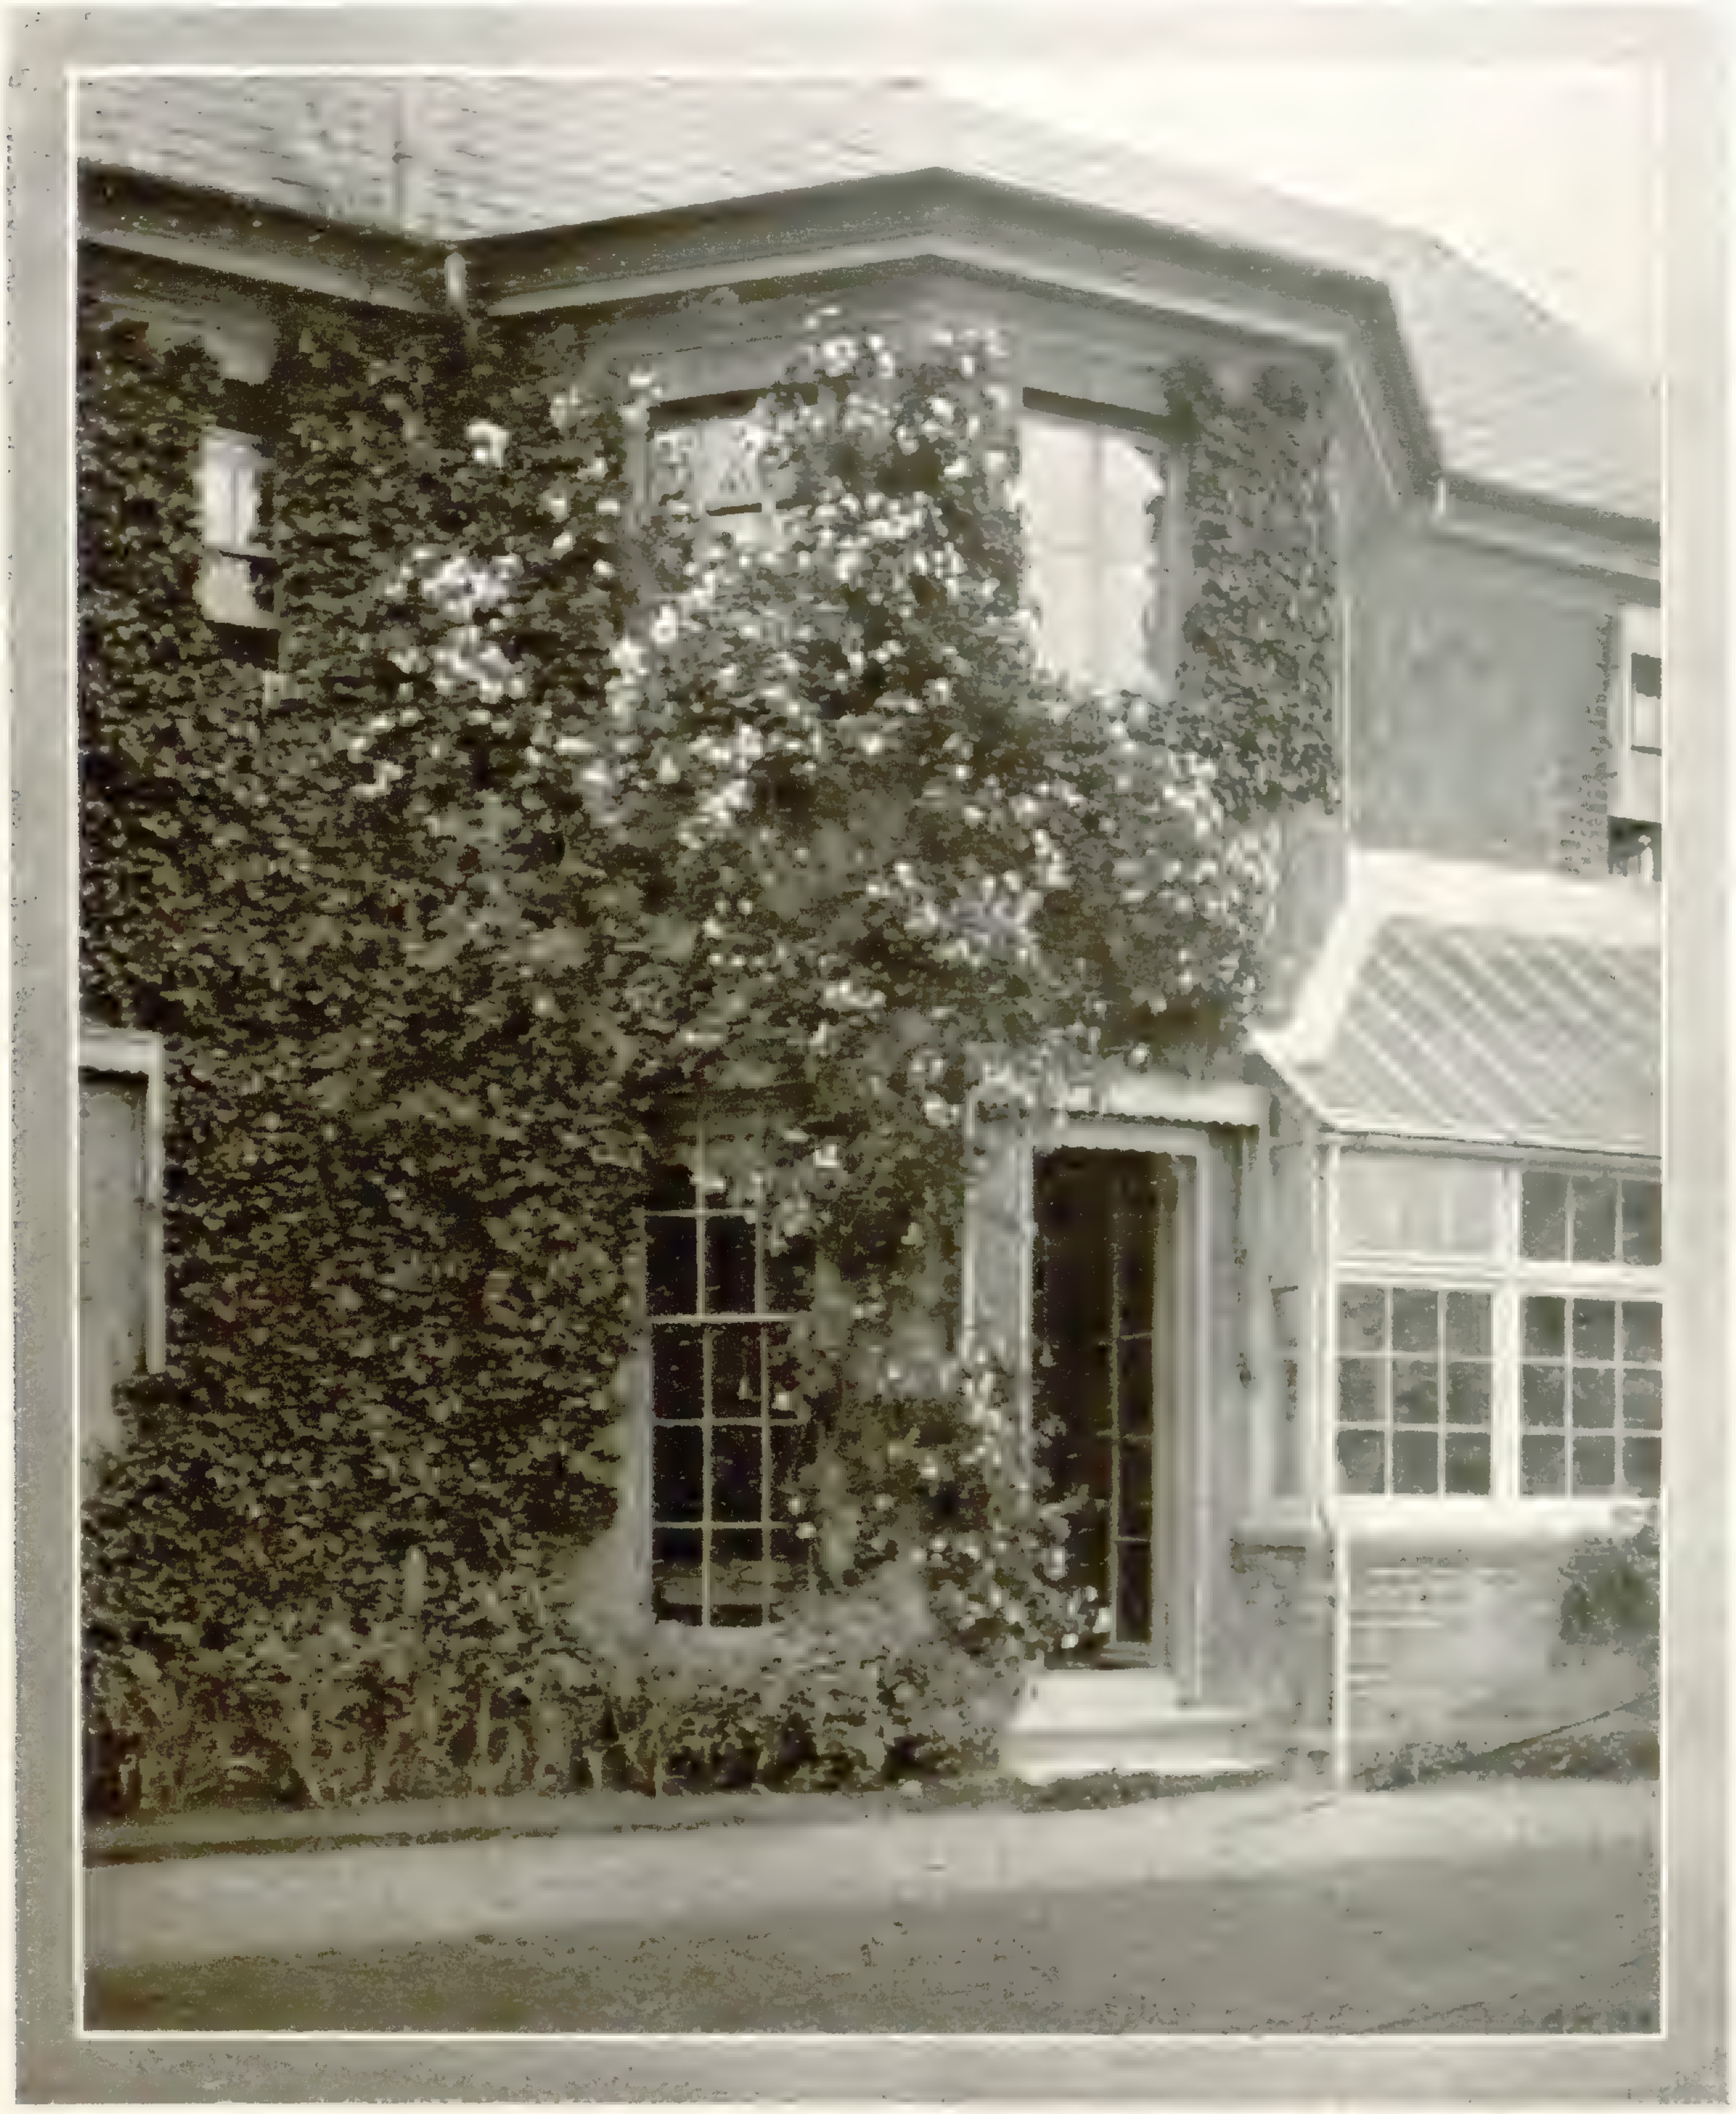


APPLE KING OF THE PIPPINS.

Thalictrum dipterocarpum.—The ranks of the meadow rues have been considerably recruited within the past few years, and that named Thalictrum dipterocarpum is proving one of the best of recent acquisitions. It comes from China, and we are indebted to Messrs. J. Veitch and Sons, of Chelsea, for its introduction. It was exhibited before the Royal Horticultural Society at the meeting of August 18, 1908, and received the commendation of the Floral Committee in the shape of an Award of Merit. Although the vote was not absolutely unanimous, it was nearly so, and the award has been justified by the plant when better known. The foliage is of the general character familiar to those who know the meadow rues, and is of a light green above, somewhat glaucous below, and is arranged in a graceful manner on the thin shining stalks. The pale purple flowers, with yellow anthers, are drooping, and are in erect panicles on stems which are about five feet high in congenial quarters. This meadow rue seems to be partial to a sunny, warm, though not too dry position, and its hardiness in very cold districts remains to be proved.—S. A.

ROSES AT STRATFIELDSAYE RECTORY.

The rural parish of Stratfieldsaye has long been of much interest, for within its boundaries is the fine estate that, nearly a century ago, was presented by the nation to the first Duke of Wellington for the splendid services he had rendered in the course of his remarkable military career. Stratfieldsaye has at the present time an added interest, more particularly to rosarians, for as its rector it has the Rev. F. Page Roberts, the president of the National Rose Society, and one of the most successful of the amateur cultivators of roses. This distinguished rosarian has had a more varied experience than the majority of amateurs, for it has been his lot to grow roses in the counties of Norfolk, Kent, and Hampshire, which, it need hardly be said, differ much both in the character of the soil and in climatic conditions. Yet he has achieved much success in each of them, a point of importance, as it again brings into prominence the fact that in the cultivation of roses, as indeed some other classes of plants, more depends upon the skill and the unremitting endeavour of the cultivator than upon the soil and climate.



[Photo: F. Mason Good.

STRATFIELDSAYE RECTORY WITH SUMMER-FLOWERING ROSES.

Thirty-five years ago Mr. Page-Roberts went from a manufacturing town in the Midlands to take up his residence and his work at Scole, a rural village in the county of Norfolk. At that time, he informs us, he did not know a rose by name, nor was he acquainted with any other classes of flowers. His floricultural instinct soon asserted itself at Scole, for within two years of his taking up his residence, he was the secretary of a horticultural society, and had been successful in winning a prize for roses. It is interesting also to learn that at Scole the soil was mostly sand resting on gravel; indeed, so poor that it could not be regarded as good for any class of flowers, and that the east winds were felt in their full force. Yet, as we know, Mr. Page-Roberts was successful in winning many prizes for tea roses with blooms cut from his plants at Scole, and on more than one occasion occupied the premier position in the class in the National Rose Society's schedule which is popularly known as the Champion Tea Class. At Stratfieldsaye both the climate and soil conditions are of a quite different character. The rectory gardens are, it may be assumed from the large number of stately trees near their boundaries, well sheltered from the east winds, and the soil is a heavy clay that is so near the surface as to render it extremely difficult to properly drain it.

The soil with which Mr. Page-Roberts had to deal at Halstead differed very materially from the soils at Scole and Stratfieldsaye, being heavy and adhesive and full of flints. He was, he has told us, just understanding how to deal with it to advantage when he was preferred to Stratfieldsaye, and, as proof of this, it may be mentioned that a fine lot of maiden teas was transferred from Halstead to the gardens of his new home. Knowing the attention which Mr. Page-Roberts has given to the soil in the production of the blooms with which he has obtained many honours, some of his friends have playfully suggested that when the Duke of Wellington offered him the living, he fully examined the soil to see whether it was good for roses before accepting it. The soil is, we are assured, of the best, but the gardens are not considered ideal for roses. The difficulty has been to find a position beyond the influence of the great elms and oaks that abound. Originally the most favoured parts of the kitchen garden were devoted to the roses, but the results were not satisfactory. They, in Mr. Page-Roberts' words, "made no growth, but dwindled and died."

In no way deterred by his earlier experiences, Mr. Page-Roberts has greatly developed the cultivation of roses in the rectory gardens, and if he has not been able to combat the conditions unfavourable to the development of blooms of the exhibition teas to the highest degree of perfection, he has succeeded in forming a rose garden rich in interest and attractions. The rose beds have been formed on one portion of the spacious lawns, with, as will be seen from the accompanying illustrations, wide grass paths between them. The illustration only shows a small part of the area devoted to roses, wherein may be seen during the summer season glorious displays of flowers, to which all the leading sections contribute liberally. One might particularise, but this would necessitate the enumeration of so considerable a number of varieties as to form a lengthy list. Many of the beds made strong claims for notice, but possibly the bed which appealed the most strongly to the notice of the writer when he had the pleasure of seeing the Stratfieldsaye roses was a bed wholly devoted to standard trees of Frau Karl Druschki.

One of the most delightful of the features of the rectory gardens at Stratfieldsaye is the pergola which was erected within a short time of Mr. Page-Roberts settling down in his Hampshire home. It is simple and substantial, and well-clothed with the finest of the rambling roses, as may be seen on turning to page 531 of last year's volume, where an excellent illustration is given. The pergola leads from within a short distance of the rectory, of which a portion is illustrated, to the interesting church, which is just beyond the boundary of the gardens, and over it Rène Andre, Dorothy Perkins, Heléne, Jersey Beauty, and other varieties equally well known spread their flexile branches in graceful profusion, and in their season yield a wealth of flowers. While roses predominate, the rectory gardens are remarkable for their borders of hardy herbaceous plants, in the cultivation of which Mr. Page Roberts is highly successful. G.

Pavetta caffra.—This South African shrub bears a general resemblance to an ixora, and, indeed, they are both members of the same order. The pavetta, however, for its successful culture, does not require as much heat as the ixoras, for it succeeds in a warm greenhouse or intermediate temperature. It forms a freely branched shrub, clothed with smooth obovate leaves. The flowers, which are freely borne in rounded clusters, are white with long prominent stamens. In byegone days it used to be grown as a specimen plant.—W. T.

JAPANESE ROCK PLANTS.

The widespread interest vouchsafed to all things pertaining to the rock garden is one of the most notable features of this age of horticultural development. There is something attractive in plants from the highland wilds and mountain ranges of the world; something about them that enhances their value and renders them the equal of the choicest exotics which need the sheltering care of the stove or intermediate house.

Japanese rock plants (though as yet not so well known as those from "nearer" lands) have a wealth of interest, and the near future should bring many more of them into our English gardens. Some few of them, notably the schizocodons (which replace the soldanella in Japan), the exquisite shortias, a few hardy orchids, etc., are very well known in this country, but the majority are outside the pale of the English rock garden. Now that the desire for Japanese plants is extending, and Japanese ideas of landscape gardening and garden decoration are being fostered by lovers of garden art, a short notice concerning some typical forms may help to maintain the interest, and direct the thoughts of the reader to a wider range of subjects, which may yet be of service in clothing rock formations and sloping banks, especially those which are "Japanese" in design.

Take, for instance, some of the rarer primulas, P. nipponica for one, with its rosettes of toothed leaves and clusters of bluish-white blossoms, or P. farinosa Fauriæ, with its quaint rhombic leaves and lilac-pink blossoms. P. cuniefolia is a pleasing rosy form, deepening to crimson at the petal edges. P. mistassinica albiflora, a quaint rarity from Mount Hayachine, in Northern Japan, is the tiniest of all the Japanese primroses, and carries its blossoms usually three upon a stem. P. Yesoana is a purplish-hued native of the Hokkaido and Shinano, with uncommon foliage, almost maple-like in shape. Other primula gems include the brilliant scarlet P. Reini, a gloriously attractive little gem, with large blossoms; the variety of P. farinosa called Modesta is an exquisite study in light pink, with a carmine centre, and the two fine forms of P. cuniefolia, known as heterodonta and Hakusanensis, the former being an extremely bright red, and the latter a soft pale pink, are charming; both forms have finely toothed leaves.

Gentianas are represented by several forms, among which we note G. Makinsi, a rich blue-flowered perennial form, which hails from the mountain sphagnum beds and grassy stretches of Central and Northern Japan. This species grows about a foot high, and the flowers, which cluster around the apex of the stem, are produced in August. Somewhat similar, save that the leaves are smaller and the blossoms white in colour, is the pretty G. algida, which is found in plenty in the central districts, and, like G. Makinsi, it is August flowering. Of less value, though extremely interesting, is the annual G. auriculata, noteworthy for its solitary wide-open, deep purple flowers. G. nipponica is charming, a very pretty semi-creeping gem, dainty both in foliage and blossom. It is deep blue in colour, quite dwarf, and should prove an acquisition. A distinct form of G. Thunbergi, under the varietal name minor, comes from the swamps and moist grassland of the high mountains. The blossoms are small, borne upon long slender stems, and the plant is but biennial in duration. Two late-flowering gentians, purple in colour, are G. sikokiana, and the form of G. scabra known as Buergeri. Both are useful plants, and are notable for their heavily foliaged flower stems and the clustered flower heads. I must also note that tiny biennial, G. pseudo-humilis, an exquisite miniature hailing from Mount Yatsugatake. The little touches of colouring are fine, and are at their best in August.

Mountain rhododendrons, too, are worthy of notice, and in some places add materially to the beauty of the landscape during their season of flowering. R. kamschaticum is found on Mount Iwate, etc., and its brilliant scarlet blossoms give a fine bit of colour in July. The light-habited R. Tschonoski, and its variety trinerva, are widely dispersed throughout the central districts; both are white flowering, the latter being most readily distinguished by its larger, three-lined leaves. R. Keiskei is rather larger, both in foliage and blossom, than the foregoing, and is of more woodland type. The leaves are thin, and covered with a minute scaly deposit, and the flowers are creamy-white. In R. hymenanthes var. pentamerum (otherwise R. Metternichi pentamerum) we greet a pretty pink-flowered form, with rosy-red blotches toward the centre; the foliage is of good size, and evergreen. Prettier still is the rich salmon-pink variety of hymenanthes known as heptamerum. The colouring is grand, and the blossoms slightly larger than the preceding form, making it a meritorious subject. Very fine is R. chrysantha, a fine yellowish gem from the central and northern districts, it is exceedingly attractive, and, like the foregoing, is of an evergreen nature.

I might go on to recount saxifrages and sedums, campanulas and shortias, violas and veronicas, potentillas and polygonums, ranunculus and pyrolas, and many other interesting plant groups, but my main point is to emphasise the possibilities of the Far Eastern empire in furnishing a rock or mountain garden. Many of the Japanese plants are full of interest and

A VIEW IN THE RECTORY GARDEN, STRATFIELDSAYE.

[Photo: F. Mason Good.

charm, and some are quite brilliant in colouring, and certainly they deserve a little more attention than they are getting at the present moment.

Lastly, I may note the richness of the Eastern Island empire in hardy orchids. Apart from the warmth-loving bletias, angræcums, calanthes, etc., there are a host of high mountain forms which are certainly rich in numbers and interest. Among them are cypripediums, goodyeras, gymnadenias, platantheras, malaxis, orchis, calypso, Herminium monorchis, listeras, etc., amply testifying to a diversity of form that is, to say the least, interesting.

As time goes on, and the horticultural trade between England and Japan increases, we may hope for many new things in the way of mountain and rock plants from the Northern islands, and the tiny islets that stud the seas around Japan proper. Sufficient has been said, however, to awaken the notice of the reader to Japanese rock plants, and possibly, in a later issue, I may further touch upon varied forms unmentioned in these notes. Certain phases of garden art testify to the taste and skill of the Japanese.

P. S. Hayward.

NEW SWEET PEA MAUD HOLMES.

The value of sweet peas with rich crimson blossoms for the production of bright colour effects in the garden, and the supply of cut flowers for competitive gatherings, market purposes, and home decoration could not well be overestimated even by the most optimistic of those who devote special attention to these flowers. It is certainly great, and we have ample evidence of it being so regarded by the general body of cultivators in the high degree of popularity which the finest of the crimson varieties in commerce have enjoyed, and, indeed, are enjoying. King Edward VII. is a remarkable proof of the high appreciation in which varieties having crimson flowers are appreciated, for within a short period of it being distributed it was to be found in well-nigh every garden in which sweet peas were cultivated. Since the introduction of that beautiful and popular variety several other crimsons have been fixed and submitted to public notice, and one of the most noteworthy of these is unquestionably Maud Holmes, which Mr. Robert Holmes, of Tuckswood Farm, Norwich, is now offering. The variety has flowers above the average in size, and these have finely waved wings and a standard of the Spencer type, and are borne on long stems in threes and fours, the latter greatly predominating. The colour is intense crimson, and this is said to be unaffected by full exposure to the most brilliant sunlight. It came out well in the trials held by the National Sweet Pea Society at Sutton Green during the past season, and is one that all who grow sweet peas should include in their selections for next year, even if they do not exceed a dozen varieties.

NEW SWEET PEA MAUD HOLMES.
Flowers brilliant crimson. Raised by Mr. R. Holmes.

CHRYSANTHEMUMS IN BATTERSEA PARK.

The annual display of chrysanthemums in Battersea Park is much appreciated by the local residents, and crowds may be seen there on Saturday afternoons and on Sundays. It is, from our point of view, one of the finest, if not the very finest, of the shows that have been held there, and a recent visit showed many interesting features. The varieties which contributed largely to the display when first opened were in many cases then over, but the house was still amply furnished with very fine flowers.

The structure in which the chrysanthemums are exhibited would admit of a better display if wider, but the best use is made of the space at command by carrying a serpentine path from end to end. In its windings the path is, from the narrowness of the house, brought in one place close to the wall, too close, indeed, to admit of ordinary bush plants being placed there. This difficulty has been overcome by training a few decorative varieties with ample foliage and profusion of bloom in fan shape, and they thus completely hide the wall, and at the same time take up but little space. An unusual feature is seen at Battersea, namely, the furnishing of the walls and parts of the roof with tall plants, chiefly of the decorative section, which are laden with blossoms. Notably among those so employed are the old white-flowered Sœur Melaine, the deep orange Source d'Or, and its crimson form Lizzie Adcock, Gloire de Mezin, a bronze-coloured flower, and Margot, salmon-pink.

The general arrangement followed is that of an undulating bank sloping down towards the walk, the monotony being relieved by a few cordylines and palms, but chiefly by plants of some of the single-flowered varieties raised well above their surroundings. This bank of flowers is in some cases narrow, and in others wide, according to the winding of the path. The front next the path is finished off with dwarf pompon varieties, which, with some large plants of Asplenium bulbiferum, serve to hide the stems of the taller chrysanthemums. The varieties of which the display is chiefly made up are Japanese kinds.

The single varieties mostly employed for breaking up the uniform level of the banks of blooms include: Edith Pagram, rich pink; Ideal, blush; Miss E. Partridge, deep rose-pink; Will Jordan, crimson lake, with a ring of white around the disc; Annie Farina, terra cotta and gold; and Bronze Pagram, rich bronze.

The Pyracantha as an Open Bush.—The pyracantha is so generally treated as a wall shrub, that its merits as an open bush are apt to be overlooked; indeed, the idea is often expressed that it will not give satisfaction in this way. This is, however, quite wrong, for examples may be met with of Lelandi's Pyracantha (Cratægus pyracantha Lelandi) growing in bush form, and being at the same time laden with berries. True, in the open the leaves are in the event of very sharp frosts more liable to be seared, than where protected by a wall, but this does not affect the autumn display of berries.—W. T.

SOME GOOD YELLOW BEDDING ROSES.

As some advertisements run, "Now is the time to plant," and inquiries are being made for suitable roses. It is rather late in the year to make a selection, but we so procrastinate, and then bestir ourselves at the eleventh hour. Let us suppose we are resolved on having beds of roses on the lawn. If we are wise, if we have regard to saving labour in mowing, we shall avoid having curly beds twisting in and out. These curly beds were all very well when "bedding out" was the fashion, when the beds were outlined with blue lobelia, but they serve no good purpose where roses are concerned. Let us have beds square, rectangular, or oblong, but no round corners or curves. Remember the lawn mower.

Having shaped our beds, what roses shall be have? In the first place, a better effect will be produced if we have all one sort in each bed. If we mix them, some will grow taller than others, and the general appearance will be ragged and rough, rather than trim and tidy. Next, What about colour? The most striking colour on lawns is yellow. That is why the yellow calceolaria played such a prominent part in "bedding out." So we decide upon having roses possessing yellow in various shades. Then, again, for beds on lawns we want compact growers, not tall straggling ones, for our object is not a few extra good flowers, but a mass of colour. But the most important point of all is that the roses should be good in autumn; well in flower in September, when country houses begin to fill up. Let us then suppose we have some half-a-dozen beds on the lawn, and that we wish to have roses of various shades of yellow, compact in habit, and good in autumn. What are the best varieties for the purpose? You say you want only well-tested sorts, not those of recent introduction, and, consequently are more or less on trial. Very well, then: Here are some which you will find suitable; they are placed in order of merit Sulphurea, Joseph Hill, Prince de Bulgarie, Les Progrés, Edu Meyer, and Mrs. Aaron Ward. A few remarks upon each of them may be helpful.

Sulphurea, T. (W. Paul and Son, 1901).—Although classed as a tea, this rose possesses all the strength and hardiness of the hybrid tea. It is essentially an autumn-flowering variety. Unlike the teas, it is late flowering, coming into bloom about the third week in July, and blooming continually until quite late in October. The colour, as the name suggests, is bright sulphur-yellow, the wood and foliage bronze, which tends to deepen the colour of the flowers. Prune it but sparingly, and you will find it one of the very best.

Joseph Hill, H.T. (Pernet-Ducher, 1903). —This is a robust hardy hybrid tea, with leathery dark green foliage, salmon-coloured flowers with yellow shading, pointed bud. The growth strong and stout, but sufficiently compact in habit for bedding purposes.

Prince de Bulgarie, H.T. (Pernet-Ducher, 1901).—A rose that leaped into popularity very soon after its introduction, and is now well known. Its growth is short, which makes it useful for bedding, the shortness of growth is due to its habit, not to its constitution. It is an exceedingly free-flowering variety, and when full out, blooming early and late, it is most attractive. The colour is variable, some flowers being silvery-flesh, others deepening into salmon, but all possess a deep yellow shade in the centre.

Les Progrés, H.T. (Pernet-Ducher, 1903). Another of this raiser's many excellent yellows. In it we have a variety of more decided yellow than the last-named, but not quite so free in flowering. Nevertheless, what it lacks in quantity is made up in colour. In the bud stage it is golden-yellow, but pales off to buff as it develops. The growth is robust and compact, and well adapted for bedding purposes.

Edu Meyer, H.T. (P. Lambert, 1903). Although this rose is not strong in growth, yet its constitution is good. More plants, however, will be required of this rose than of the others to fill the bed. To omit it would be a loss to the general effect, both on account of its colour, and also of its very late-blooming habit. The wood and foliage are light green, the colouring of the blooms is distinct from any other variety, being described in one catalogue as "copper-coloured yellow, shaded nasturtium red and orange." The flowers are comparatively small for a hybrid tea, but quite large enough to make a bed of this variety attractive.

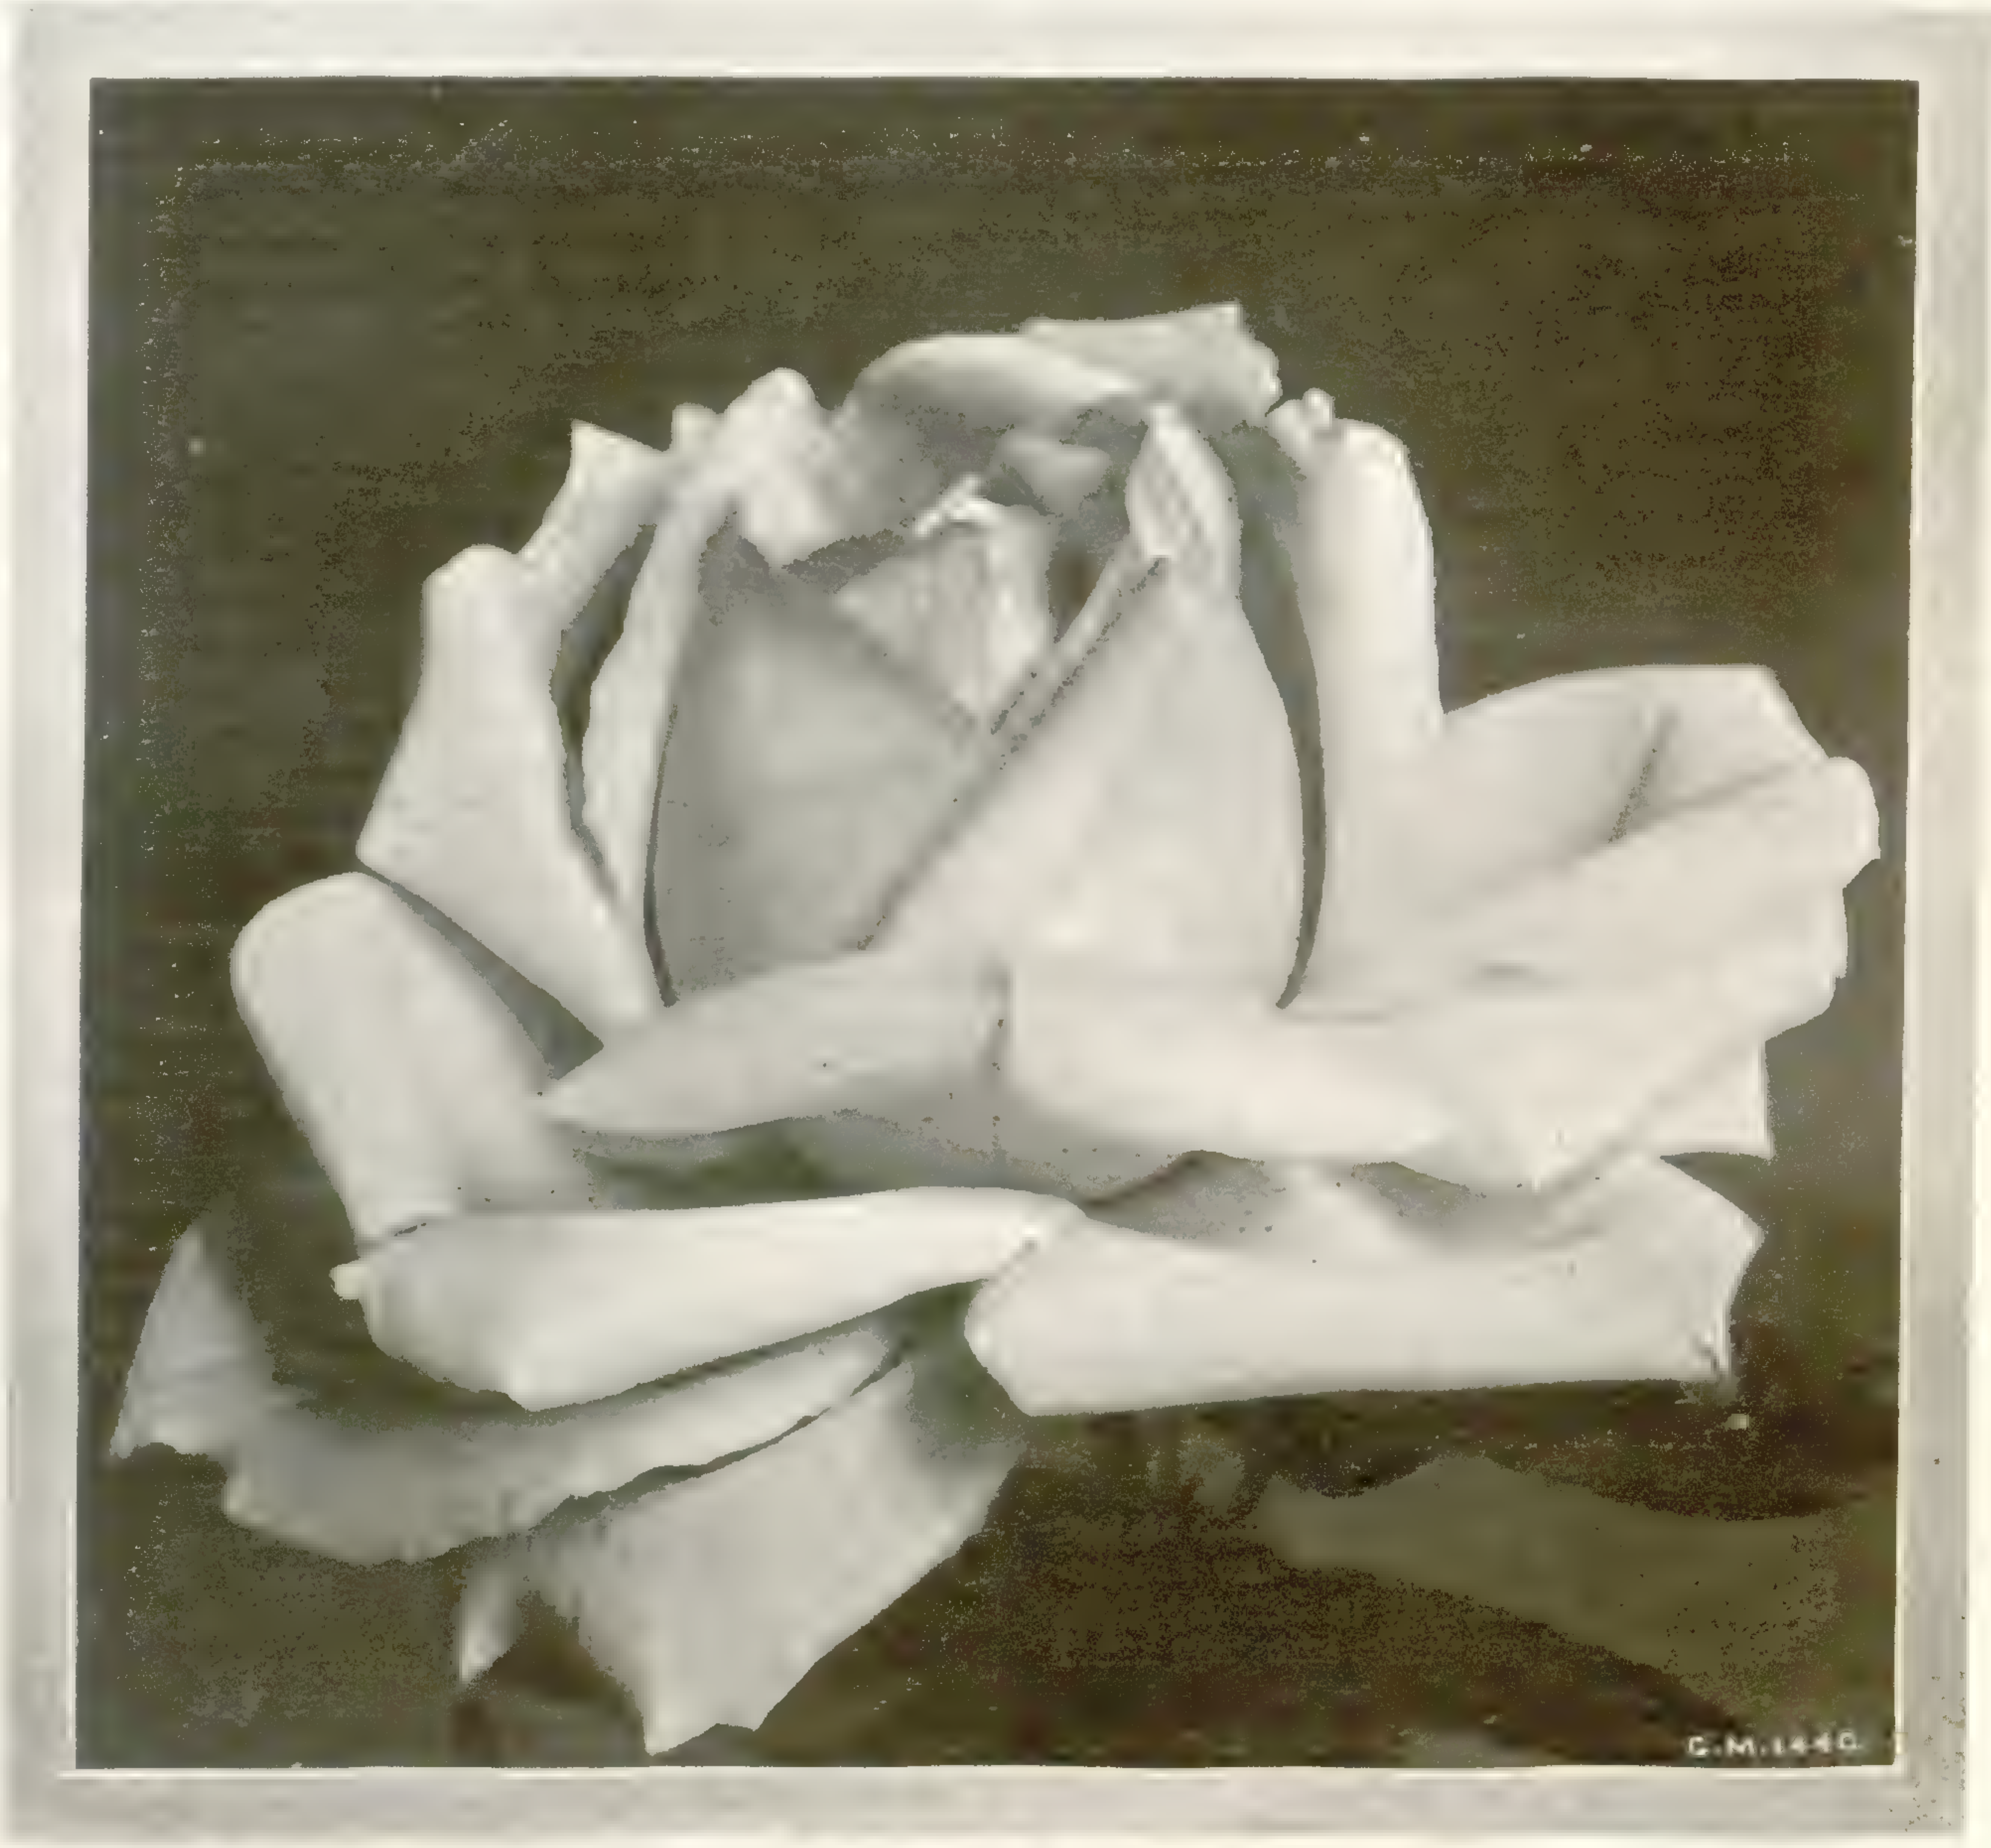
Mrs. Aaron Ward, H.T. (Pernet-Ducher, 1903).—A rose with a stiff, short-growing habit, very compact. Not perhaps so free flowering as some, but it is valuable on account of the colouring of the blooms, a deep yellow, shaded orange. Plant this variety close together, after the French method, and the bed will be very effective.

JOSEPH H. PEMBERTON.

Havering.

NEW H.T. ROSE JAMES FERGUSON.

This fine new hybrid tea rose is, we believe, a sport from that famous and popular variety Caroline Testout. It closely resembles this variety in size and form, and apparently has all the good qualities of Caroline Testout, with the added beauty of broad silvery-pink petals. For exhibition purposes it promises to be a great success, while, following its parent, it should possess considerable value for garden decoration. Some very fine blooms were shown at the Royal Horticultural Hall on September 15 last, on the occasion of the autumn show of the National Rose Society, by Messrs. W. and R. Ferguson, Brucefield Fens, Dunfermline, and on that date a Silver-gilt medal was awarded to the variety, which, as indicated above, was named James Ferguson.



NEW H.T. ROSE JAMES FERGUSON.
Flowers silvery-pink. Silver-gilt Medal, N.R.S., September 15. Messrs. W. and R. Ferguson, Dunfermline.

Pear Emile d'Heyst.—I have never seen fruits of this variety in better condition than they are this year. It is not really a large fruit, but I have noted some remarkably fine specimens at the November shows. There are few varieties to equal it as regards flavour and cropping. As far as my observation goes, the tree is inclined to bear heavily and to make only moderate growth in light soils during rather dry summers where ordinary treatment has been given; but the fruits are larger and lighter in colour this year, and freer growth of tree has been made; no doubt the character of the past season accounts for all this. As a wall or bush tree, it is a grand variety for both large and small gardens.—G. B.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

TEMPERATURE.—The temperature of the different divisions of the orchid houses should now be reduced to the minimum winter figure. This should not be effected suddenly, but gradually, until the desired temperature is reached. If the reduction is extended over a period of about two weeks there will be little likelihood of the plants receiving a check.

MOISTURE.—With a lower night temperature the atmospheric moisture must be reduced accordingly. Much of the disfiguring black spot often prominent among masdevallias and other cool orchids is caused either by excessive moisture in the atmosphere or at the roots during periods of low temperature, the latter being brought about by the sudden falling of the outside temperature. No hard and fast rules can be laid down, nor is it safe to state one for guidance, as the conditions under which orchids are cultivated in different parts of the country are so varied.

COVERING ROOFS AS A PROTECTION IN EXTREME WEATHER.—Where the roof is fitted with lath roller blinds as a means of shading in summer these latter are also exceedingly useful as a means of protection during the prevalence of gales or excessive frosts in winter, especially where houses are large, or at all lofty. The only difficulty is when there is a snowstorm. Unless the runners which carry the blinds from eaves to ridge are fixed reasonably close together, or the ends are supported, the weight of the snow causes them to sag, and frequently the blinds are afterwards thrown out of shape, or some of the laths may get broken. We find it a good plan to let these blinds down every night when there are signs of frost. This makes a very great difference to the temperature inside the houses, and dispenses with a considerable amount of artificial heat. In smaller houses, where lath blinds are rolled along close to the glass, the same advantages are felt without the risk of damage from weight of snow. Where these are not obtainable some mats should be tied together and rolled along the roof, or even old tiffany shading may be used for the purpose; this prevents the glass becoming frozen through, and so precludes the difficulty caused by the drip of very cold water on the plants where they are arranged on side stages. The side lights and ends may also be protected, even if the covering is not fitted closely to the framework; considerable advantage is derived from ordinary No. 5 tiffany shading hanging from the eaves or tacked below the gutter.

VALVES.—Examine all valves; see that they are well oiled, and in good working order, so that they may be ready for any emergency. If a split socket, or a defective ring or joint goes wrong, it will generally occur at the most unfavourable moment, so that too much care cannot be taken to guard against trouble.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

MIGNONETTE.—Plants for flowering in spring should be kept close to the glass, and given an abundance of air on all favourable occasions. The plants should not be fed at this season, but after the commencement of the new year, when the roots will again become active, a little feeding will be an advantage. If the plants have a tendency to show flower, these should be pinched out, stopping the shoots evenly. The chief condition necessary for success in growing good mignonette is to encourage the roots to the surface; therefore water must be supplied with great care, as mignonette is most impatient of an excess of moisture.

MARGUERITES that were lifted and potted up some time ago will now have recovered from the check thus caused, and be useful for the conservatory. Spray them occasionally with quassia solution, or some other insecticide, which will help to keep the leaves free from pests.

CYTISUS.—No attempt should be made for the present to force these cool greenhouse plants, for if subjected to heat they rarely furnish a good supply of flowers. They need very careful watering, and should not be watered until the roots really need it, or the foliage will quickly turn yellow; at the same time, drought would be followed by shedding of the leaves. Large plants growing in comparatively small pots may be given weak liquid manure at every fourth watering.

PLUMBAGO ROSEA. — The graceful winter-blooming P. rosea coccinea superba, now coming into flower, should be afforded a very light position as near to the glass as possible, in order that the flowers may perfectly develop their delicate colours. Do not syringe the plants overhead, but if they are in a very dry position, damp slightly between the pots as the flower spikes continue to develop. A temperature of 50 to 55 degrees, with the usual rise in the daytime, will be sufficient, and the atmosphere should be fairly dry in order that the flowers may continue in good condition for a considerable period. Plumbago rosea possesses a most effective colour for dinner-table decoration.

BATCHES OF HYACINTHS AND TULIPS should be moved into a warmer structure to keep up the supply of cut flowers. Later batches in ashes should be examined lest growth becomes drawn.

CAMELLIAS. — Close attention must be paid to watering these shrubs, whether they are growing in tubs or pots, or planted out in the borders; for if they are allowed to become at all dry many of the flower-buds will fall. It will be well to raise the tubs and pots by placing three thin blocks under each, so as to ensure perfect drainage. Disbudding should now be commenced, the work being done gradually, so as not to cause a severe check to the plants.

CHRYSANTHEMUMS.—As these pass out of flower, any variety that is not to be grown another year should be at once discarded, retaining only those which are required for propagation. These latter should be placed in a position near to the glass, exposed to full light and with abundance of air. The best cuttings are those prepared from firm and short-jointed growths. If, therefore, the cuttings have already been drawn up weakly because the plants have been placed thickly together, thin out the weakly growths to a limited number, so that those retained may acquire more vigour. Some varieties are shy in producing cuttings, and such should be encouraged by removing some of the surface soil and affording a top-dressing of good loam, leaf-mould, and sand. If these materials be well mixed together they will encourage root action, and the production of growths for use as cuttings in due time.—W. Staward, Preston Hall Gardens.

THE FLOWER GARDEN.

PLANTING ROSES.—It is much the best policy to complete this work as early as possible, for, without a doubt, November is by far the best month for the operation. Most, if not all, roses delight in a deep rich soil, into which a goodly proportion of well-decayed manure has been worked while the ground was being dug or trenched. Where the soil is very retentive or stiff vegetable matter, burnt or decayed, might prove beneficial, in addition to the manure. On light sandy soils the addition of cow manure will aid in keeping the soil and roots cool during hot weather—a point in the cultivation of outdoor roses that should not be lost sight of. Where the soil is of an exceptionally light and porous nature the addition of flaky clay that has been exposed to the atmosphere for some time will prove a decided advantage. Before planting carefully trim the ends of any roots that may have been injured in any way, and shorten back those of exceptional length. During planting make the soil fairly firm around the plants, afterwards mulching the surface of the beds with a good layer of light, half-decayed manure; this latter, to a large degree, insures the safety of the plants should the winter prove severe, protecting, as it does, the most vital part of the plant, namely, the collar, or point of union. Tea roses, whether newly planted or established, should be protected unless the soil and situation be exceptionally favourable; dry bracken is an excellent material for this purpose if loosely placed between or about the plants, protecting them, not only from severe frost, but cold, cutting winds as well, which, in many instances, are as injurious as frost and snow.

THE PLEASURE GROUNDS.—If to be kept neat and tidy these will entail a considerable amount of labour at this time. Now that most of the leaves have fallen from the trees they should, when swept together, be removed at once to a convenient place, and there reserved for future use, either as material for hotbeds or for leaf-mould. Portions of the lawn, where the grass has become thin, may receive a dressing of burnt refuse or slaked lime; this should be applied during mild or open weather, and not during frost. All recently planted trees and shrubs should be mulched and securely staked in order to prevent disturbance at the roots during windy weather. Preparations should also be made for protecting tender, or half-hardy evergreen trees and shrubs during severe weather; timely attention to such matters should not be lost sight of, and all should be in readiness when required.

SHRUBBERIES AND VACANT BEDS in prominent positions should be made clean and tidy. The surface of old gravel walks should be turned, or freshened up by the addition of new material, or where these consist of turf, the edges must be neatly trimmed, and the whole put in order for the winter. Where new paths are being made careful attention should be given to proper drainage—a matter too often overlooked. In all instances the gratings and drains should be large enough to carry off all surface water quickly; at the same time the former should be as inconspicuous as possible. Suitable receptacles, to catch the silt from the gravel, should be constructed beneath these, or the drains may soon become blocked and fail to carry off the water.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

PRUNING.—Every effort should be made to push forward pruning, taking advantage of fine days for this operation with a view to complete it as soon as possible. There is nothing gained in delaying pruning, although, in the case of newly-planted trees the pruning could be deferred for a few weeks, but at the same time, as I have pointed out in a previous calendar, we have found from practical experience here that it is advantageous to the future growth and welfare of the trees—with the exception of cherries—to prune them the same year as they are planted. It is a common error in many gardens to treat all trees and varieties alike when pruning. The operator should be thoroughly conversant with each particular variety which has to be operated upon; some varieties bear their fruits upon the extreme ends of the current season's growth, while others will bear good crops of fruit when the spur method is adopted. Where young trees have to be dealt with it is absolutely necessary to prune them somewhat hard for a few years, to build up a foundation for good specimen trees. The foregoing remarks apply more particularly to trees grown in the open quarters.

GOOSEBERRIES AND CURRANTS.—Where summer pinching was followed for gooseberries and red and white currants the leading shoots of the main branches, if required for extension, should be cut back to within nine inches, and all side shoots should be pruned back to within an inch of the main branch: particular attention should be paid to thinning out and regulating the main branches of gooseberry bushes, so as to allow plenty of space for the hands to pass easily through when gathering the fruit.

When pruning black currants it should be borne in mind that the finest fruits will be produced next year upon this season's growth, so pruning should be confined to all old and superfluous wood, and to judiciously thinning the young growths. Where it is deemed advisable to undertake the propagation of these bush fruits, well ripened shoots should be selected at the present time and planted in nursery rows, adopting the same method for making the cuttings as that advised in the calendar for January 8 last. After the work of pruning is finished the twigs and branches should be raked up and consigned to the fire heap, and if the weather is at all favourable no time should be lost in lightly forking over the soil between the bushes preparatory to adding a good surface dressing of rich farmyard manure.

RASPBERRIES, LOGANBERRIES, AND BLACKBERRIES.—Assuming the old canes were cut out as soon as the fruit was gathered, the young canes should be well thinned now, and the unripened tips cut off; they should then be tied neatly and securely to the wires, or to whatever supports are used. This season the loganberry has made a superabundance of lateral growths, and these should be severely thinned out, cutting them back to within three or four buds of the main canes; after the work is finished and the prunings are cleared up a good mulching of farmyard manure should be spread over the surface of the soil.—Henry R. Farmer, Cardiff Castle Gardens.

LILIUMS AND FROST.

Although I do not believe in exposing lilium bulbs wilfully to frosts during the depth of winter, I have proved that such exposure neither kills nor seriously damages them. A few years ago I had grown in the flower garden a large number of liliums, chiefly L. speciosum, L. s. Kratzeri, L. s. Melpomene, and L. s. rubrum. In the autumn of that year one of the young men, while engaged in lifting and bringing away the bulbs, placed a number of them near the edge of a shrubbery border, and there they remained fully exposed to several rather severe frosts before I discovered them. After a close examination I found that the bulbs were quite sound, and, apparently, uninjured, so I left them thus exposed throughout the winter, in order to see how they came through it.

Rather early in the New Year fresh growth commenced, and, though very slow, it was stronger than had been the case when the bulbs were purchased and first planted. By the end of April the new stems were about five inches high, and very healthy looking. But early in the New Year some good leaf-soil and loam mixed had been placed under the bulbs for the latter to root in, though practically the whole of each bulb was left exposed.

In due time these lilium bulbs were replanted in the flower beds, and were more satisfactory as regards growth and flowers than in the former season. The roots had taken possession of the mixture of leaf-soil and loam, which was planted with them as it still adhered to the roots. All the scales of the bulbs were sound, plump, and brittle, and full of sap at the end of the winter. I am, of course, not advocating this treatment generally, but I would advise inexperienced persons who may have had bulbs thus exposed for a time to retain them, and not discard them as worthless. G. B.

The Dwarf Pomegranate.—This is a very old plant in gardens, the date of its introduction being given as 1723. For a low sunny wall, such as that of a hothouse, it is just the thing, as limited to three or four feet in height it will flower profusely. The flowers, which are at their best in August and September, are of a bright sealing-wax red, and thus make a goodly show. They are particularly attractive just before expansion. Late in the autumn the leaves died off brightly tinged with yellow.—W. T.

EXHIBITIONS AND MEETINGS.

◆

Norwich.

NOVEMBER 17, 18, and 19.

There were great doings in Norwich on the above dates, when shows of fat cattle, poultry, dogs, and of chrysanthemums, fruit, etc., were held in various halls in the city. There were crowds of people about, and apparently each exhibition was well attended. This, at any rate, was so in the case of the flower show, which was held in St. Andrew's Hall, a magnificent building of great architectural beauty and historical interest. There seemed to be something particularly appropriate in a display of the best of modern horticultural products being housed in a building that so well exemplifies the art and skill of a bygone age.

GROUPS.

The schedule opened with a class for a circular group of chrysanthemums and foliage plants, the circle being eight feet in diameter. A challenge cup went with first prize, and the successful exhibitor was Mr. T. Notley, gardener to E. G. Buxton, Esq., Catton Hall, Norwich. A few fine big blooms, arranged evenly over the group, were well supported by yellow, bronze, and crimson decorative varieties, ferns being used around the base. Mr. J. Woodard, gardener to F. Tidman, Esq., 29, Bishop Bridge Road, Norwich, was the only other competitor.

CUT BLOOMS.

The principal class was for forty-eight blooms, Japanese, in not less than thirty-six varieties. Mr. E. Leach, gardener to W. H. Palmer, Esq., Ormesby, was awarded first against three other competitors, his stand containing a nice even set of blooms, although not of specially large size. C. H. Totty, Lady Talbot, Miss E. Fulton, and Mdme. G. Rivol were among his finest blooms. The second prize was awarded to Mr. C. Nicholls, gardener to T. A. Rising, Esq., Manor House, Ormesby. This stand had a few very good blooms, but lacked evenness. Mr. E. F. Bull, gardener to J. W. Brooke, Esq., Adrian Lodge, Lowestoft, third.

For thirty-six blooms, in not less than eighteen varieties, confined to Norfolk growers only, two exhibitors were forthcoming, the lead being taken by Mr. J. King, gardener to C. J. Hacker, Esq., The Grange, Great Ormesby, with very fresh flowers that included some really good specimens. There was good competition for twelve distinct varieties of Japanese, Mr. Rogers, gardener to Lord Rendlesham, Rendlesham Hall, taking the lead. Lord Hopetoun, M. Knox, and Magnificent were three of his best flowers; Mr. W. Laws, gardener to G. E. White, Esq., Eaton House, Unthank Road, Norwich, second; Mr. R. Gee, gardener to A. J. Raven, Esq., Conifer Hill, Starston, third. Mr. C. Nicholls had the leading six blooms of one variety of Japanese, staging six good blooms of Mdme. G. Rivol, Mr. J. King, gardener to G. J. Hacker, Esq., took second with very even blooms of capital depth, Reginald Vallis being the variety.

For a group of cut chrysanthemums arranged for effect on four feet run of table space, the lead was taken by Mr. C. Nicholls, who put up nice flowers of Algernon Davis, Hon. Mr. Lopes, Mrs. C. Frick, and others, the table being decorated with trails of smilax. A special first prize in this class was awarded Mr. T. Notley, whose exhibit was of decorative varieties with vine leaves as a setting. Mr. H. Saville, gardener to R. Gurney, Esq., Earlham Hall, received second prize; and Mr. E. Leach, Ormesby, third. There were three entries for incurved, twelve varieties, distinct, and Mr. T. J. Broom, gardener to Miss Langworthy, Gays House, Holyport, was at the head of the competitors with flowers of fine texture, and fair depth; Mr. E. Hill, gardener to F. J. Montagu, Esq., Wynford Hall, Mundford, second. Naturally grown blooms had provision made for them, but it can hardly be said that they made a great display. There were also classes for baskets, epergnes, and for hall stands decorated with chrysanthemums and autumn foliage, some of the arrangements being very tasteful.

MISCELLANEOUS PLANTS.

There were several classes for winter flowering plants, and some useful decorative subjects were staged. Begonia Gloire de Lorraine made a bright bit of colour, Mr. Woodhouse, gardener to Dr. Osborne, The Grove, Old Catton, having the best three plants; Mr. Marjoram, gardener to W. Jerrold, Esq., Roxley, Thorpe, coming second; and Mr. F. J. Endersby, gardener to J. H. Gurney, Esq., Keswick Hall, Norwich, third (8 entries). Mr. Woodhouse also won for six cyclamen, as well as for three Begonia Turnford Hall. The most successful exhibitor of orchids was Mr. Lewis Smith, gardener to Miss T. Fellowes, Shotesham Park, Norfolk, who took firsts for six distinct, three distinct, and second for a single specimen, showing a nice piece of Oncidium varicosum Rogersi.

MISCELLANEOUS CUT FLOWERS.

There were four competitors for the prizes offered for a collection of stove and greenhouse flowers, Mr. J. Hilson, gardener to Sir F. Adair, Bart., Flixton Hall, Norfolk, scoring with Plumbago coccinea, Salvia Pitcheri, Browallia speciosa, allamandas, and other good things. Mr. Smith, Shotesham Park, was a good second, the old favourite Leonotus leonurus and a nice spike of Cattleya Bowringiana being included on his stand. A nice lot of perpetual carnations were staged, Mr. Allan, Gunton Park, and Mr. Rogers, Rendlesham Hall, being awarded equal first prizes for small, but choice collections.

FRUIT.

In the challenge cup class for a collection of twelve varieties of fruit, including grapes, dessert apples and pears, and kitchen apples, Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead House, Norwich, was the only exhibitor, and there was not really much quality in even that exhibit. The same exhibitor was first also for nine dishes of dessert apples; Fearn's Pippin and Allington Pippin were included in this exhibit, and were nice fruits. There were four entrants for six dishes of dessert apples, Mr. W. Allan, of Gunton Park, leading with excellent fruits of Mabbot's Pearmain, Winter Ribston, Ribston Pippin, Blenheim Pippin, Cox's Orange Pippin, and King of Pippins. Second went to Mr. T. Jones, gardener to E. G. Cubitt, Esq., Honing Hall, whose fruits were of firm texture, and very even. Mr. F. Graveling, Bella Vista, Thorpe Road, Norwich, third.

Mr. J. Alborough, gardener to N. Prior, Esq., Thorpe St. Andrew, led for three dishes of apples, and for a single dish of Cox's Orange Pippin Mr. E. Hill received first prize for a dish of fine fruit, but quite unlike any Cox's we have seen, the fruit being very deep, and of almost unbroken lemon colour. In the culinary classes were some big shapely fruits, Mr. G. Davison, gardener to Colonel B. J. Petre, Westwick House, Norwich, staging nine really good dishes in his first prize collection. Mr A. V. Coombe, gardener to Lord de Ramsey, Haverland, was a good second. Mr. T. Jones, Honing Hall, had the best six dishes, and Mr. J. Alborough the best three varieties.

Six dishes of dessert pears brought two entries, Mr. Allan, of Gunton Park, scoring with beautifully finished fruits of Pitmaston Duchess, Durondeau, Doyenne du Comice, Marie Louise, Beurre Diel and Hacon's Incomparable. Mr. Davison, Westwick House, second, having fine fruit. Some nice fruit was put up in the stewing pear classes and in single dishes.

Mr. W. Allan, Gunton Park, obtained first prize for three bunches of Black Alicante grapes, showing beautifully finished bunches of fair size; Mr. A. V. Coombe second, with somewhat loose bunches; Mr. E. F. Greene, Old Catton, third. Mr. Jones, Honing Hall, scored for three bunches of Black Hamburgh, J. Fitzpatrick, Esq., Dereham Road, Norwich, being second, and Mr. F F. Bull, Lowestoft, third. For three bunches, three black varieties, Mr. Coombe took the lead, Mr. Allan coming second, and Mr. Greene third. Mr. H. G. Oclee, gardener to the Marquis of Lothian, Blickling Park, had the best single bunch of black, showing a big cluster of Gros Colmar. Mr. Allan's winning bunch of white was Muscat of Alexandria.

VEGETABLES.

There was a big display of vegetables, which occupied most of the space in the Blackfriars Hall. Messrs. Sutton and Sons, Messrs. Webb and Sons, Messrs. Carter and Co., and Messrs. Daniels Bros., Lim., all provided classes, chiefly for single dishes, and the quality of the exhibits was of a high order all round, the local gardeners and amateurs coming forward heartily to compete for the large number of prizes offered.

NON-COMPETITIVE.

A table of very choice vegetables was exhibited by Messrs. Sutton and Sons, Reading. About ten distinct varieties of tomatoes were represented by dishes of fine shapely fruits. Some beautifully modelled Ailsa Craig onions, good melons, and a variety of uncommon things, were effectively staged with single chrysanthemums as a set-off. Messrs. Hobbies, Lim., Dereham, occupied a large space with an exhibit of single and decorative chrysanthemums in pots, and also in a cut state. A rich crimson single, named Weybridge Belle, was very striking, and there were also good varieties in bronzes, pinks, and yellows. Some baskets of roses were good for the time of year.

Mr. G. W. Miller, Clarkson Nursery, Wisbech, arranged a very nice group of orchids, representative of most of the genera that flower at this season of the year. The plants were small, and of a particularly healthy appearance, and the flowers of bright clean colours. Messrs. Fred Smith and Co., Woodbridge, put up a table of vegetables, including good potatoes, parsnips, carrots, and onions. Some cut chrysanthemums were also used. Zonal pelargoniums, in both cut flowers and growing plants, were well staged by Messrs. C. Holmes and Sons, Acle, Norfolk. The semi-doubles were very fine, especially Gustav Guich, a huge orange-scarlet, and Mrs. Lawrence, a dainty pink.

Across one end of the Blackfriars Hall Messrs. Daniel Brothers, Lim., Norwich, put up a group of miscellaneous winter-flowering plants, supplemented by some fine blooms of Japanese chrysanthemums, Astilbe Peach Blossom, Begonia Gloire de Lorraine, Salvia fulgens, Clerodendron fallax, and liliums, all playing a part in a nicely arranged group. The same firm exhibited groups of small shapely conifers, hollies, eleagnus, etc., and of young fruit trees, pot roses, etc. An exhibit of well-preserved bright coloured apples was staged by Messrs. W. Seabrook and Sons, Chelmsford. Among the culinary varieties were splendid fruits of Peasgood's Nonsuch, Rival, and Norfolk Beauty, and among the dessert varieties, Cox's Orange Pippin, King of the Pippins, and Worcester Pearmain were well shown.

Samples of chemicals, artificial manures, ground bones, etc., were shown by Messrs. W. Colchester and Co., Ipswich, who also exhibited some good vases of new chrysanthemums of good size and substance. The stand was effectively arranged, and came in for a good deal of attention. Alpha spraying machines were exhibited in a number of sizes and patterns. The Knapsack machine, recently awarded the gold medal at the Northern Counties Fruit Congress, was much sought after by the East Anglian fruit growers. The same stand also had on view a new metal propagating tray, with movable divisions, which facilitate transplanting young plants without breaking their roots.

MEDAL AWARDS.

Silver.—Messrs. Sutton and Sons, Messrs. Daniels Brothers, Lim., Messrs. Hobbies, Lim., Messrs. W. Seabrook and Sons, Alpha Extinguisher, Lim.

Bronze.—Mr. G. W. Miller, Messrs. Fred Smith and Co., and Messrs. R. Holmes and Co.

The R.H.S. silver-gilt medal for the best exhibit in the show was awarded to Mr. H. Palmer, for forty-eight blooms of chrysanthemums.

Windsor.

The nineteenth annual autumn display was held in the Albert Institute on November 17. This is a central site, but all too small for arranging the exhibits in the best possible manner. The date was perhaps a trifle late for this southern fixture, still, the cut blooms were quite first rate. The groups of single-flowered chrysanthemums were quite the feature of the show, so well were the plants grown and arranged.

Cut blooms were the leading feature of the show. The chief class was that for five blooms each of six varieties, Japanese, arranged in vases, and for which the King's Challenge Cup was offered with a cash prize, but, unfortunately, on this occasion only two competitors took part—three was the number required. Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead, was an easy first with fully-developed, well-staged blooms of Purity, Lady Talbot, Hon. Mrs. Lopes, Reginald Vallis, Maud Jefferies, and F. S. Vallis. Mr. G. Spong, gardener to W. A. Owston, Esq., Langley House, Langley, second with much smaller blooms. For eighteen Japanese, distinct, arranged in a space 5ft. by 3ft., with any foliage plants, the object being to show how large blooms can be associated with foliage in a decorative manner, Mr. T. Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone, Surrey, was easily first of four entrants with massive examples of Lady Talbot, Hon. Mrs. Lopes, Mdme. G. Rivol, Purity, J. H. Silsbury, and Frank Payne, well displayed on a base of ferns intermixed with Spiræa Thunbergi, and Osmunda regalis with their autumn tints. Mr W. H. Hearn, gardener to Mrs. Gerald Goodlake, Hawthorn Hill, second with good blooms poorly displayed; Mr. Page third with smaller blooms nicely set up.

The latter secured the premier position for twelve incurved and a similar number of Japanese, distinct, with very good specimens of Duchess of Fife, W. Pascoe, Romance, Lady Isabel, Emblême Poitevine, J. F. Evans, Clara Wells, and Fred Palmer. The Japanese were Lady Talbot, Pockett's Crimson, Edith Jameson, Mr. C. Pentord, Hon. Mrs. Lopes, W. Gee, and Mrs. J. C. Neil. Mr. F. Capp, gardener to E. Iveson, Esq., Charters Towers, Ascot, second with smaller examples of similar varieties. A class was provided for twelve large blooms, any section, arranged in one vase with any foliage, to illustrate the value of large blooms for room decoration, and right well the six entrants did this with their various methods of arrangement. Mr. Stevenson, with grandly-developed blooms of the Japanese variety Purity pleasingly associated with sprays of Spiræa Thunbergi and the variegated symphoricarpus, was easily first; Mr. H. W. Hearn was second with well-proportioned flowers of F. S. Vallis; Mr. G. L. Crowsley, gardener to Miss L. Oppenheim, Hawthorn Hill, third with mixed blooms of fairly good quality. Among eight competitors Mr. H. Bowyer, gardener to Sir Robert Harvey, Langley Park, won for twelve Japanese, distinct, with an even set of blooms of popular varieties; Mr. G. L. Crowsley, second. No fewer than twelve entered for six Japanese, any one variety, and Mr. Stevenson won with desirable blooms of Lady Talbot, Mr. Page following with F. S. Vallis, a trifle uneven. In a similar class for incurved Mr. Page, with really good flowers of Clara Wells, won with a little to spare; Mr. G. West, gardener to F. Ricardo, Esq., Old Windsor, second, with Mrs. J. Wynne.

Single-flowered varieties, undisbudded, arranged in vases, were plentiful, and contributed by eight exponents, who made a good display down the centre of the table in the body of the hall. Mr. W. Coles, gardener to Mrs. E. B. Foster, Clewer Manor, was first with such sorts as Sylvia Slade, Mensa, Bessie Pagram, and H. Hearn as the best; Messrs. Page and Stevenson second and third in the order given. A class was provided for six decorative varieties, and Mr. Steward Smith, Englefield Green, won with a desirable collection of flowers for the purpose required.

For a group of decorative chrysanthemums, not disbudded, and arranged in a semicircle 8ft. by 4ft., a challenge cup and a cash prize were offered, which induced five competitors to take part, the class making one of the finest features seen at an autumn show this year. Mr. G. West won decisively with well-grown plants that were displayed so perfectly in a pyramid-like mound that little fault could be found with the exhibit. Such varieties as Sylvia Slade, Lyra, Delphinius, Reginald Godfrey, and a number of seedlings were employed. Mr. W. Cole was second with a really good exhibit, although a few defects in arrangement at the front were perceptible; Mr. F. Capp, third. Mr. G. West won the leading prize for a group of miscellaneous plants arranged for effect, with well-flowered cattleyas, cypripediums, and Oncidium varicosum. Mr. G. Baskett, gardener to P. Nelke, Esq., Woodlee, Virginia Water, second.

Carnations were contributed in good numbers in the various classes set apart for them. Four entrants staged six vases, distinct, for Mr. A. F. Dutton's prizes, Mr. G. West winning with May Day, Carola, Enchantress, Mrs. Burnett, and Britannia, and also for three vases, distinct, six flowers in each, with similar varieties and blooms.

Fruit and vegetables were well shown. Mr. Stevenson secured the first prize for six dishes of apples with exceptionally fine fruit of Rival, Cox's Orange Pippin, and Ribston Pippin.

Messrs. Tett and Son, florists, Windsor, had a pleasing display of bouquets, wreaths, etc., which were admired by the many visitors.

Winchester,

NOVEMBER 15 and 16.

The annual show at Winchester was held in the Guildhall, and was a distinct success. Nowhere can a more complete display of autumn products be seen than here. Chrysanthemums are naturally the leading feature. Cut blooms are of a high order of merit, the incurved specimens being remarkable for their high quality and numbers. The Japanese are of distinct merit, and, the date being suitable for them, specimen plants are here a fine feature. They are not of unwieldy size, but they are furnished with blooms of exceeding high and excellent quality, and that is of far greater importance than mere numbers of flowers. Miscellaneous plants, as groups arranged for effect, begonias, primulas, etc., are all interesting, and of a high order of merit. The management is of the best, in the careful, experienced hands of Mr. Chaloner Shenton, who has long held the office of hon. secretary, and his assistant, Mr. Saunders.

PLANTS, CHRYSANTHEMUMS.

In the class for a collection, with an edging of foliage plants, in a space eight feet by seven feet, quality and general effect to be the leading features, there were two competitors, which is fewer than usual. Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Moreton House, Winchester, was first with quite fine blooms, but a stiff arrangement and a faulty edging. Mr. J. Knight, gardener to James Harris, Esq., Barton Mark, Winchester, second. A class is here provided for nine plants, distinct, suitable for conservatory decoration, with not less than five blooms on each. The aim is to encourage high quality flowers on dwarf plants with good foliage. Mr. G. Adams, gardener to Colonel Dickins, Edge Hill, Winchester, was easily first with dwarf, well-flowered plants of the following: Madame G. Rivol, J. Peed.

DO NOT MISS THE
BRITISH COLUMBIA GOVERNMENT
APPLE EXHIBIT
At the ROYAL HORTICULTURAL SOCIETY'S EXHIBITION OF COLONIAL FRUITS at VINCENT SQUARE, WESTMINSTER, S.W., on December 1st to 3rd.

See the free display of animated pictures of Industries and Scenery in British Columbia in the Hall.

Information given by Government Representative in charge of the Exhibit, or can be obtained free of charge from the Agent General for British Columbia, Salisbury House, Finsbury Circus, London, E.C.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

Madame R. Oberthur, Splendour, Emblême Poitevine, and F. S. Vallis as the best. Mr. G. Cousins, gardener to J. A. Fort, Esq., 69, Kingsgate Street, Winchester, second. Mr. H. Gigg, gardener to the Rev. R. M. Moorsom, Holyrood, third. For nine plants, any white and yellow varieties, under similar conditions, there were three entries, and a good display. Mr. Adams was again the most successful, with really fine specimens of F. S. Vallis, Nellie Pockett, Godfrey's Eclipse, C. H. Curtis, Mrs. F. Judson, and Emblême Poitevine. Messrs. G. Cousins and H. Gigg followed in the order here given.

Naturally-grown undisbudded plants here receive encouragement. For three, Mr. A. Taylor, 3, Hillside Terrace, Winchester, was first with quite freely-flowered plants of the single Sylvia Slade, Kate Thompson, and Glitter. Single specimen plants were numerous and good, Mr. Adams, with J. H. Silsbury, carrying remarkably fine blooms, was first.

CUT BLOOMS.

Cut blooms are here staged on boards, with the exception of those in two classes, which are arranged in vases. The former method is more popular here.

For the prizes for thirty-six, in not less that twenty-four varieties, there were three competitors, and Mr. C. Moore, gardener to Mrs. Clark, Frensham Place, Farnham, won the premier award with grandly developed blossoms of the following varieties: Hon. Mrs. Lopes, Maud Jefferies, Bessie Godfrey, W. Mease, Lady Talbot, J. H. Doyle, J. H. Silsbury, J. Lock, W. Gee, F. S. Vallis, Master James, Mr. C. Penford, Pockett's Crimson, Splendour, Leslie Morrison, Mrs. R. H. B. Marsham, John Peed, Purity, Keith Luxford, Mrs. A. T. Miller, and Rose Pockett. Mr. A. J. Marsh was a good second with a somewhat uneven set of blooms; Lady Talbot, F. S. Vallis, Madame P. Radaelli, and Madame G. Rivol were the more noteworthy. Mr. W. Higgs, gardener to Mrs. B. Hankey, Fetcham Park, Leatherhead, who was third, followed the second prize winner very closely.

In the class for twenty-four, not less than eighteen varieties, exhibitors in the preceding class not to compete, there were five entrants, making a good display. Mr. W. Baxter, gardener to Captain F. J. Dalgety, Lockerley Hall, Romsey, occupied the premier position with clean, richly coloured examples of popular varieties well staged. Mr. W. Wilson, gardener to Mrs. Christie, Ribsden, Windlesham, second. There were four entries in the class for twelve, and Mr. D. Edwards, gardener to W. Garton, Esq., Sarisbury Court, Southampton, was first with medium-sized even blooms of popular varieties. Mr. Rone gardener to J. Ridley Shield, Esq., Carden, Alresford, second.

As usual, the incurved varieties formed an important section of the show. In the class for thirty-six, in not less than twenty-four varieties, there were three competitors and the first place was occupied by Mr. W. Higgs with a characteristic stand of modern varieties. The more prominent blooms were those of Clara Wells Lady Isobel, Emblême Poitevine, G. F. Evans, Daisy Southam, Duchess of Fife, Amber Beauty, Buttercup, Frank Christian, Mrs. J. Wynne, Frank Hammond, Calypso, J. Wynne, Doris Rainer, The Egyptian, Mrs. G. Denyer, and Mrs. Bernard Hankey. Mr. Wilson was second with a somewhat uneven set. Mr. J. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, third.

Eighteen, in not less than twelve varieties, were best shown by Mr. M. A. J. Marsh, his blooms being of medium size and high quality. Messrs. D. Edwards and J. Hughes followed closely for second and third places in the order of their names.

There was but one entry in the class for six varieties, Japanese, arranged in vases, and that was from Mr. C. Moore, who had fine examples of J. H. Silsbury, Hon. Mrs. C. Lopes, F. S. Vallis, and Splendour. Single-flowered varieties, not disbudded, are here a distinct feature, and in the class for six vases there were seven competitors. Mr. J. Hughes won easily with Bronze and White Pagram, Sylvia Slade, Roupell Beauty, and Mrs. Kitson, all beautifully developed. Mr. C. Smith, gardener to A. H. Evans, Esq., Harris Hill, Newbury, second; Mr. E. Henderson third. Decorative varieties, other than singles, not disbudded, receive much encouragement, and in competition for the prizes for six bunches, distinct, Mr. A. Taylor won with effectively arranged vases of Soleil d'Octobre, John Shrimpton, Kate Thompson, Sœur Melaine, and W. Sabery; Mr. J. H. Hughes second.

OPEN TO LADIES ONLY.

The most tastefully arranged dinner table was exhibited by Mrs. Arthur Bide, Alma Nurseries, Farnham, who used the beautiful yellow rose, Lady Hillingdon, with good effect. Mrs. Ladhams was second. The last-named won for a stand of flowers, foliage, and grasses with carnations, and lily of the valley; Mrs. Bide quite close for second place, with Madame A. Chatenay rose.

VEGETABLES.

Vegetables were finely shown, especially by Mr. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, who won the leading place in competition for Messrs. Sutton and Son's prizes, and also in Messrs. Toogood's class, staging very fine onions, tomatoes, celery, leeks, and potatoes.

MISCELLANEOUS.

Non-competitive exhibits were not numerous, but they were good, and added materially to the interest of the show. Messrs. E. Hillier and Sons, The Nurseries, Winchester, had a fine display, including apples, carnations, begonias, shrubs, etc. (gold medal). Mr. Myers had apples grandly coloured, quite rivalling the British Columbian exhibits in that respect (silver medal). Messrs. Toogoods, Southampton, had vegetables; Messrs. Ladhams, shrubs and hardy plants; and Mr. Wootton, Fair Oak, carnations.

Aylesbury.

The thirty-second exhibition of the Vale of Aylesbury cultivators was held on November 17 in the Corn Exchange and adjoining Meat Market, in conjunction with a "bread competition," in which fully 2,000 two-pound square loaves were entered for the medals and prizes offered by the several large milling firms in the United Kingdom—an attractive combination of "flour" and "flowers."

Aylesbury would seem to be somewhat conservative, for while many societies are reducing the number of classes for chrysanthemums in pots, this society provides eleven classes in two or three divisions in addition to groups for effect. On the present occasion some 96 plants were in competition, the old Cedo Nulli pompons being conspicuous. Among the "extras" was an interesting exhibit arranged by Mr. Philip Mann, F.R.H.S., horticultural instructor to the Bucks County Council, comprising a collection of apples grown in the county. No special manure had been used in the cultivation of the trees, generally six or seven years' planted, but the samples on plates and those graded and packed bore strict scrutiny as to form and colour—very handsome and bulky were the examples of Lord Derby, Lane's Prince Albert, Sandringham, Alfriston, Emperor Alexander, Peasgood's Nonsuch, Tyler's Kernel, Charles Ross, Blenheim Pippin, Bramley's Seedling, Annie Elizabeth, The Queen, Tower of Glamis, Bismarck, and Warner's King; while of dessert kinds Allington, Wyken, Cox's Orange, King and other pippins were associated with James Grieve, Red Reinette, Lord Burghley, and Calville Rouge Precoce.

One of the principal classes for cut blooms was the ten vases of triplets, the chief award going to Mr. W. Tipler, gardener to Mrs. E. D. Lee, Hartwell Park, who had in grand form Splendour, F. S. Vallis, Dubison Foubert, G. J. Bruzzard, Lady Talbot, Reginald Vallis, Bessie Godfrey, Magnificent, and Algernon Davis; the second prize falling to Mr. Pullen, gardener to Miss Napier Higgins, Winchmore Hill. For eight varieties in vases first prize went to Mr. R. Mead, who was strong with Romance, Countess of Warwick, Reginald Vallis, C. H. Curtis, and M. L. Resseau. For six incurved, one variety, the awards went first to Buttercup, second to C. H. Curtis, and third to Mad. Ferlat; and to one incurved first and second to Romance, and third to Battercup; and for six Japanese, one variety, the stands of Master James, Reginald Vallis, and C. H. Totty were selected for honours.

Fruit was largely staged, the grapes being Alicante and Alnwick Seedling; the apples and pears being well-known sorts, nicely coloured, Mr. Pullen, Winchmore Hill, having a fine assortment as an extra exhibit. Vegetables were staged in the Meat Market, and comprised fully 900 specimen potatoes, the onions, sprouts, cauliflowers, turnips, etc., being also good; the Intermediate carrots were simply superb, shapely, and of excellent colour, but parsnips, though gigantic, were a trifle rough; the cottagers put up twenty collections of six kinds each.

Bristol Chrysanthemum Society.

The annual exhibition of this society was held on November 16 and 17, in the Victoria Rooms, Bristol, and proved to be a decided improvement upon those held in recent years.

CUT BLOOMS.

The chief class for these was for thirty-six Japanese, in which six exhibitors participated. Mr. G. Hall, gardener to the executors of the late Lady Ashburton, Melchet Court, Romsey, secured leading honours with handsome blooms of Maud Jefferies, Mary Inglis, Ernest Godfrey, Purity, John Peed, W. A. Etherington, Annie Hamilton, J. W. Wells, Mrs. J. C. Neal, Miss Hankey, Lady Talbot, etc., and with the last-named won the prize offered for the best bloom in the show. The second place was taken by Mr. W. Iggulden, Frome, who staged almost equally fine examples of Frank Jolliffe, Mad. G. Rivol, W. Mease, Mad. P. Radaelli, Rose Pockett, Mrs. W. Iggulden, Mad. R. Oberthur, etc.; Mr. J. R. Tooley, gardener to H. Andrews, Esq., third. For twelve blooms, Japanese, Mr. Baker, gardener to Dr. J. Cropper, was placed first, and staged a good set, including Sir Frank Crisp, Miss E. Fulton, Leigh Park Wonder, Rose Pockett, and F. S. Vallis. The second prize went to Mr. F. Yerbury, gardener to Mrs. J. Wheeler, who was followed by Mr. A. M. Wilson. In a similar class, open only to gentlemen's gardeners and amateurs, there were seven entries, Mr. G. Hall again securing the lead, and staging in fine condition Maud Jeffries, Mrs. G. Mileham, Mad. Bott, Pockett's Crimson, Lady Henderson, etc.; Mr. G. Sutton, gardener to W. A. Todd, Esq., was placed second, and Mr. F. Lockwood third.

For incurved, distinct, twelve blooms, Mr. Hall once again proved invincible, and staged model flowers of Mrs. J. Judson, Souv. de W. Clibran, Doris Rayner, Triomphe de Mont Brun, Mad. Primley, Nellie Hall, Romance, Miss Cora Stoop, Ialene, Mrs. J. Wynne, and Pantia Ralli. Mr. Baker, who had as his best Clara Wells, Buttercup, Fred Palmer, Godfrey's Eclipse, and Emblême Poitevine, was a good second, and Mr. J. Bishop, gardener to H. E. Murray Anderson, who, had some of his blooms been a little more dressed, might have been higher placed, was third. There were six entries.

VASE CLASSES.

The blooms staged in this class were very handsome. For six vases Japanese, three blooms in each, Mr. Hall again secured the coveted position amongst five exhibitors, with a splendid set composed of T. W. Vallis, F. S. Vallis, Lady Talbot, Annie Hamilton, Mrs. G. Mileham, and Mary Inglis, Mr. C. Vincent, gardener to J. A. Waller, Esq., was second, and Mr. W. Iggulden third. Mr. Iggulden took leading honours for six blooms of any variety, shown in two glasses, with splendid blooms of Mad. P. Radaelli; Mr. H. Cornelius being second with J. H. Silsbury; twelve entries. For six blooms of any white Japanese variety, Mr. Iggulden was placed first, staging beautiful blooms of Purity, and was followed by Mr. C. Vincent, with Elsie Fulton, Mr. Sutton being third with A. T. Miller. Mr. Iggulden again scored in a similar class for a yellow Japanese, having Helena Williams; Mr. Vincent was again second, and Mr. G. Runnacles took the third position. Single varieties in six sorts, arranged in separate vases, brought six entries, and made a charming bank. Mr. A. O. Shelton, gardener to Calvert Fisher, Esq.; Mr. Hignell, gardener to W. Reid, Esq.; and Mr. Jennings, gardener to R. Dalton, Esq., were the prize-winners in the order named.

GROUPS.

Only three exhibits of chrysanthemums and ornamental-leaved plants, arranged on fifty square feet, were forthcoming, and the best of these was from Mr. Bannister, gardener to Mrs. St. Vincent Ames, who had a bright and good arrangement of well-grown plants, the chief of which were Japanese and single chrysanthemums, skilfully blended with crotons, palms, and other graceful subjects, and edged with maidenhair fern. Mr. Thoday, gardener to L. Todd, Esq., was placed second, and Mr. Ellis, Weston Nursery, Weston-super-Mare, third.

For a group of miscellaneous plants, chrysanthemums excluded, Mr. Ellis took a good lead with an imposing group, containing as his chief plants, several kind of orchids, and liliums, poinsettias, palms, crotons, and ferns; Mr. Curtis, gardener to Sir W. Howell Davies, was the other exhibitor. The best of two groups of chrysanthemums came from Mr. F. A. Burt, gardener to Mrs. Stucky Wood, who used plants with good foliage and fine blooms, well varied in colour, nicely arranged and edged with Maidenhair fern; Mr. Hunter, gardener to J. Buckland, Esq., second.

Orchids had eight classes provided for them, and were, as is invariably the case at Bristol, well shown, cypripediums in particular being present in many choice varieties. A class for a group brought two exhibitors, viz., Mr. Spowage, gardener to Col. Carey Batten, and Mr. Woodward, gardener to E. Watts, Esq., who each arranged a choice assortment of well-grown plants, and were awarded prizes in the order named. Mr. R. J. Love, gardener to A. S. Groves, Esq.; Mr. Shelton, and Mr. Woodward, were leading exhibitors in other classes.

For winter-flowering begonias, ornamental fruiting plants, salvias, cyclamen, primulas, poinsettias, together with specimen ferns, and ornamental foliage plants, classes were provided, and the exhibits skilfully disposed about the rooms did much to increase the beauty of the show.

FRUITS.

For a collection of six dishes of fruit the leading exhibitor was Mr. Tooley, gardener to H. Andrews, Esq., who had grand Alicante and Muscat of Alexandria grapes, Early Favourite melon, Cox's Orange Pippin apple, and Beurre Bachelier and Beurre d'Esperen pears; Mr. Wilkinson, gardener to G. A. Gibbs, Esq., was placed second with an almost equally good collection, and Mr. Springham third.

Mr. Tooley, proved to be a champion with grapes, being placed first for Muscat of Alexandria, Alicante, Gros Colmar, and Mrs. Pince; while Mr. R. H. Jennings, gardener to R. Dalton, Esq., was first for Lady Downes Seedling, and Mr. Coote first for any other black variety with Gros Maroc. Messrs. Wilkinson, E. Chivers, Shelton, and Curtis were other prominent prize winners.

Apples were,throughout the five classes provided for them, splendidly shown. G. Pow, Esq., led for six dishes, culinary varieties, with grand fruits of Bramley's Seedling, Lane's Prince Albert, Gascoigne's Scarlet, Tyler's Kernel, Peasgood's Nonsuch, and Newton Wonder; Mr. H. C. Meadows second. For one dish Mr. Wilkinson led with an exceptionally fine, highly-coloured set of Peasgood's Nonsuch; Mr. Davies, gardener to Dr. Shaw being second with the same sort. S. Pow, Esq., again won leading honours for six dishes, dessert varieties, with splendid fruits of Cox's Orange Pippin, Allington Pippin, Ribston Pippin, Baumann's Red Reinette, Lord Burghly, and Rival; second, J. H. Virgo, Esq. Mr. Pow again led with four dishes, dessert, and was followed by the Rev. J. R. Wood. Twenty dishes of a dessert variety were staged, Mr. Baker, Mr. Stucky, and Mr. Hedges winning the prizes with Cox's Orange Pippin. Mr. Bannister retained his reputation as a cultivator of pears, securing the leading prizes both for six dishes and for four dishes, with grand fruits of Durondeau, Doyenne du Comice, Beurre Bosc, Beurre Diel, Marie Louise, and Pitmaston Duchess; Mr. McIntosh, gardener to Lord Islington, and Mr. Little were his chief rivals. Mr. McIntosh led with Doyenne du Comice for a single dish, and was followed by Mr. Baker and Mr. Bannister, each staging Doyenne du Comice.

TRADE EXHIBITS.

Gold medals were awarded to Mr. Cypher, Cheltenham, for orchids; Mr. Murrien for floral designs; Messrs. Clibran, Manchester, for vegetables; and The British Columbia Government for apples. Silver gilt, to Messrs. Garaway and Co., Bristol, for apples, zonal geraniums, and decorative plants; and Messrs. Parker and Sons, Bristol, for floral designs. Silver, to Messrs. Stuart Low and Co. for orchids; Messrs. Parsons and Co., for bulbs, etc.; and The Tilehurst Pottery Company for horticultural pottery.

Bolton.

As usual, the Bolton Horticultural Society staged an exhibition worthy of its high traditions. The Albert Hall was packed, on November 18 and 19, with a varied and interesting display. The five groups, twelve feet in diameter, all followed the same lines, i.e., a substantial pyramid in the centre, surmounted by a good palm, and surrounded with small groups and dot plants, the intervening spaces filled with plants in variety. Mr. H. Shone, the esteemed treasurer, gardener to J. W. Mahant, Esq., occupied the position of honour, his sprays of Oncidium Rogersi, in quantity, spreading a brightness over the whole; cattleyas, dendrobiums, begonias, crotons, etc., also proved effective. Mr. W. Burgess, gardener to John Harwood, Esq., was second, with good palms, crotons, etc.; Mr. J. Wainwright, gardener to E. T. Crook, Esq., third.

For a group of undisbudded chrysanthemums Mr. W. Burgess led with a fair lot; Mr. Robert Tyrer second; and Mr. H. Bishop, gardener to G. Hughes, Esq., third. For a group of large flowers Mr. H. Drinkwater, gardener to H. Parke, Esq., led with fair-sized fresh blooms, well staged. For a table of growing orchids arranged with foliage plants, Mr. W. Holmes, gardener to J. McCartney, Esq., was first, and secured the R.H S. silver medal. Mr. W. Holmes proved the winner for a table of cypripediums with a batch of fine healthy plants; Mr. H. Arthur, followed.

For twelve incurved and twelve Japanese blooms Mr. C. Jennings, gardener to F. W. Jameson, Esq., led with good blooms of Mr. A. T. Miller, F. S. Vallis, Lady Talbot, May Shields, Romance, Lady Isabel, etc.; second prize fell to Mr. G. W. Drake, Cardiff; third to Mr. G. Haigh, gardener to Sir W. H. Tate, Bart. For thirty-six Japanese blooms, not less than twenty-four varieties, Mr. A. Chandler, gardener to A. James, Esq., had the best out of four good lots, his finest flowers being F. S. Vallis, Lady Talbot, Hon. Mrs. Lopes, W. Mease, J. H. Silsbury, H. Stone, Algernon Davis, etc.; Mr. G. Haigh second, with a good stand; Mr. Charles Jones, third.

For six vases of singles, Mr. A. Adshead led, and he also led for six vases of decorative varieties.

Mr. J. Wright, gardener to E. Lord, Esq., won in the grape class with moderate bunches of Alicante, and for the two white bunches the same exhibitor scored with Muscat of Alexandria. For a collection of eight varieties of vegetables Mr. James Bailey won with good examples, including tomatoes, Brussels sprouts, etc.

Mr. W. Eckersley was successful in winning the gold medal for two pots of large-flowering chrysanthemums.

Woolton.

This small but charming show was held on November 16, in the Church Hall, under most unpleasant circumstances, the weather, which, unfortunately, has proved the case with most of the Liverpool and district shows, being so bad that the takings were greatly reduced.

As usual, the main feature was the single varieties, nine vases, with nine blooms in each vase, arranged on a space 4ft. square. The winner, Mr. G. Eaton, gardener to W. Tod, Esq., Allerton, may be proud of his win as Woolton claims to stage the finest singles in the country. The winning stand was composed of Felicity, Edith Pagram, Admiral Seymour, Metta, White E. Pagram, G. W. Forbes, Pink Felicity, Merstham Jewel, and Mansa; the blooms were from six to seven inches in diameter, with splendid substance and great purity of colour, arranged over pleasing coloured foliage backed with fronds of Davallia; the other prizemen were Mr. T. Keightley, gardener to P. W. Barr, Esq., who had much larger flowers, but lacking in quality and colour; Mr. H. Howard, gardener to A. S. Mather, Esq., and Mr. J. Rothwell, gardener to S. S. Bacon, Esq.

For twenty-four Japanese Mr. Eaton again had the premier set with a good all-round stand; Mr. J. Stoney, gardener to Colonel J. Gaskell, was second. For eighteen Japanese, distinct, Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., led the way with a good collection. For eighteen incurved varieties Mr. Haigh was again to the fore with fine blooms. For twelve Japanese Mr. T. Keightley led, and for the same number of incurved Mr. J. Clarke, gardener to T. Clarke, Esq., proved the winner. For ten Japanese and five incurved, arranged with any foliage, Mr. G. Haigh led with heavy blooms, formally arranged. For three vases of singles, six in each vase, Mr. J. Stoney staged the winning lot. For three large-flowering chrysanthemums, in pots, Mr. T. Keightley won with handsome, trained plants, his Mrs. Norman Davis being especially noteworthy. For one incurved Mr. W. Wilson, gardener to W. Cunningham, Esq., was first and likewise for one pompon, one reflexed, and one single; Mr. T. Keightley had the best anemone, and Mr. Haigh the best reflexed. For one palm Mr. G. Haigh scored with a grand Kentia, and for the single fern Mr. J. McColl, gardener to J. W. Hughes, Esq., led with a grand Goniophlebium subauriculatum. For two orchids Mr. McColl again led the way, and for the single plant won with a grand Vanda cærulea with nine large flowers of deep rich blue colour. Mr. Haigh had the best foliage plant, Mr. G. Eaton the best cypripedium, Mr. Stoney the best three decorative plants. Mr. Keightley the best two begonias, and Mr. Haigh the best three salvias.

For two bunches of white grapes, Mr. J. Hoggarth, gardener to Colonel W. H. Walker, M.P., won with good Muscat of Alexandria, and for black grapes Mr. McColl led with Alicante; for three dishes of dessert apples Mr. J. Clarke led; for a collection of vegetables Mr. J. Clarke was first in the gardeners' class, and Mr. James Gore in the farmers'.

Chester.

This exhibition was held on November 16 and 17, in the Town Hall, the Assembly Hall and annexe with the Council Chamber being utilised to the full. The show was held under the auspices of the Chester Paxton Society, which is doing admirable work in diffusing knowledge in the culture of hardy fruits; each exhibit in this division bears a card giving the name of the exhibit, the soil, stock, and, in some cases, the age of the tree, and other valuable information. The schedule embraces eighty classes for fruit, the majority being for single dishes.

The show is famous for its groups of chrysanthemums, and this year possibly the four groups staged were in advance of former years. For a group of single varieties Mr. E. Stubbs, gardener to Major MacGillycuddy was to the fore with a bank of richly-coloured bloom, charmingly arranged; the flowers, although reaching to a height of nine or ten feet, faced the visitor—an important factor in lofty arrangements. Mr. A. Walker, gardener to Mrs. Potts, was second with a telling display. For a group of representative, naturally-grown flowers Mr. T. Gilbert, gardener to T. Gibbons Frost, Esq., led with a fine bank of colour, in which ferns and greenery were blended; Mr. E. Stubbs followed with a pleasing combination. For four pots, distinct, single varieties, Mr. E. P. Smith was first.

For six distinct Japanese varieties, three blooms of each, in vases, Mr. C. Goves, gardener to Sir Gilbert Greenall, Bart., was the winner with heavy blooms; and for twelve Japanese, set up in two vases, the same exhibitor won, having good President Viger and Leslie Morrison. For five blooms of one variety Mr. J. Fleet, gardener to Mrs. Thompson led with extra heavy specimens of F. S. Vallis. For five incurved, distinct, Mr. C. Goves was again to the fore. For twelve Japanese not less than nine varieties, arranged on stands, Mr. W. May, gardener to W. Drensfield, Esq., led, having good blooms of Hon. Mrs. Lopes, J. H. Silsbury, etc. The best-arranged six vases of naturally-grown sprays were from Mr. A. Petcarin Campbell, who had unnamed varieties, the same exhibitor winning for six vases of single varieties.

For the best-arranged table Mrs. J. Nixon was well ahead with a beautiful table of orchids; this lady also had the best basket.

For two bunches of black grapes Mr. W. May was successful with Alicante, and for whites Mrs. James Clack, gardener to J. G. Frost, Esq , led with Muscat of Alexandria. Mr. Godfrey F. Hugh secured the bronze medal in addition to the first prize, with excellent fruits of Cox's Orange Pippin; Mr. W. A. Peirce also had a like award for extra large fruits of Lord Derby, and Mr. James Thornton for heavy fruits of Bramley's Seedling. For a new kitchen apple Mr. J. Weaver won with Byford Wonder. For twelve distinct varieties of kitchen apples Mr. P. Greene was first, having good Peasgood's Nonsuch, Lord Derby, and Warner's King. For six dishes Mr. W. Pilgrim was first, having extra fine Loddington Seedling, etc.

For twenty-four varieties of apples and pears Mr. G. Aitken was an excellent first with extra fine Worcester Pearmain, King of the Pippins, Pitmaston Duchess, etc. For six varieties of dessert apples the Rev. L. Garnett won with well-coloured fruits of Cox's Orange, Melon Apple, Adam's Pearman, etc.

In the non-competitive division a large gold medal was awarded Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, for a large display of chrysanthemum blooms arranged with dried grasses, coloured foliage, berries, etc. Messrs. Dicksons received a like award for a fine display of chrysanthemums, interspersed with bamboos, palms, etc. Messrs. Clibrans had a small gold medal for a bank of cut chrysanthemums. A fine exhibit of apples was staged by the British Columbia Government, and chrysanthemums, palms, fruit, etc., by Messrs. McHattie. Mr. J. Francis secured a bronze medal for a collection of cacti.

National Chrysanthemum Society.

The Floral Committee meeting of this society, held at Essex Hall on Monday, November 21, was well attended, and the room was well filled with exhibits of beautiful flowers, including many splendid novelties, from Messrs. W. Wells and Co., Merstham; Mr. L. Lawrence, Shoreham; Mr. H. W. Thorp, Worthing; Mr. G. Mileham, Leatherhead; and Mr. Philip Ladds, Swanley Junction. It was a very fine display for so late a date and for so cold a day, and the Floral Committee had a very busy sitting.

At the meeting of the Executive Committee, held at Carr's Restaurant in the evening, there was again a good attendance, Mr. Thomas Bevan presiding. The cash balance to date was £73 0s. 1d., and it was estimated that there would be a comfortable little balance to the good at the end of the year. The Dinner Committee expected a record attendance and an excellent programme at the annual dinner, and the secretary reported everything in order for the forthcoming Chrysanthemum Conference. A few special awards recommended by the judges at the November show were confirmed, and it was resolved that a silver-gilt medal be presented to Mr. W. Higgs, suitably engraved, to commemorate his record of winning the Holmes' Memorial Cup for incurved blooms for twelve years in succession.

Mr. C. Harman Payne graphically described the Paris Show, and its attendant festivities, and referred to the presentation by Sir Albert Rollit of N.C.S. Medals to the respective presidents of the National Chrysanthemum and National Horticultural Societies of France. Mr. Thomas Bevan gave an interesting report of the Brussels Show, and referred to several points in connection with the Paris Show, not mentioned in Mr. C. H. Payne's narrative. The meeting was a most interesting one, and showed that the society is still full of life, and has, indeed, the promise of a renewal of vigour and prosperity.

Broughty Ferry Horticultural Association.

The ordinary monthly meeting took place on the evening of the 15th inst., the president, Mr. James Bethel, presiding. Being question night, Mr. James Slater, Panmure Villa Gardens, enquired, "The cause of, and remedy for, red rust on roses?" Mr. Slater explained that he had no knowledge of the disease, his roses being free from attack: but he knew from reports that it was prevalent in many gardens. Mr. Grant, Fernhall Gardens, expressed his opinion that badly drained soil was likely to cause it. He had one or two beds, hollowed out of rock, which were planted with H.P.'s three years ago, and these showed increasing signs of the disease, which he thought was imported with the plants; but, as none of the other beds showed any signs of the rust, the latter idea had been almost abandoned. Mr. George Masson, Ayestree Gardens, said, undoubtedly bad drainage and low-lying situations were the chief causes; he had charge of a garden a few years ago where the disease was very bad, and he had succeeded in keeping it in check by spraying with paraffin emulsion and sulphur. Other members spoke in like manner.

The chairman exhibited some shoots of roses showing the rust on the leaves, and he explained that they were taken from a plant growing in the shrubbery adjacent to a plant of Buxus balearica, the plants in the rose garden being comparatively free from attack. He opined that the disease was a species of puccinia, a fungus found in gardens as P. buxta on box edgings and other plants; P. mentha on mint, P. grossularia on leaves of gooseberries and fruit; P. malvastrum on the hollyhock, and on farms there was the dreaded Puccinia graminis or wheat rust. He thought it desirable to look for the rust on other plants in the vicinity of infested roses, as there was a probability that it was migratory, or had different hosts at different periods. The conditions already mentioned were congenial to the dispersion of the spores, but he had seen two gardens lately very badly affected where the conditions were by no means alike, one being low lying, shaded, and damp, while the other was on the top of a hill exposed even to sea breezes; the subsoil was, however, a heavy clay. Sulphate of copper or Bordeaux mixture, sprayed on the plants at graded strength to suit the season of application, ought to be efficacious if proper conditions of cultivation were observed. The question was a very important one, and worthy of an answer from a more scientific body.

The second question, asked by Mr. G. Masson, was in relation to the preparation of the ground for sweet peas. After debating the question, the consensus of opinion was that trenches for lines and pits for clumps ought to be taken out at least two feet deep, farmyard manure placed in the bottom, the natural garden soil replenished as well as possible with turfy loam, and a dressing of kainit and basic slag, these being applied in autumn. Sulphate of potash, sulphate of ammonia, and other stimulants to be applied during the growing season.

The Chairman exhibited leaves of holly and the common "bishop-weed" badly affected with the leaf-mining maggot, and enquired of the members a remedy for this troublesome pest, which seemed as much at home in the leaves of dandelion and bishop-weed in the hedges as in the cinerarias and chrysanthemums in the greenhouse. If they were allowed to multiply at the present rate, a plague was inevitable. He questioned the use of fumigants, except for killing the fly when on the wing under glass, while squeezing the maggot in the leaf was a laborious job, but nevertheless the recognised method of destruction. A decoction of bitter aloes or quassia extract rendered the leaves distasteful, but this could not readily be employed in the woods and hedgerows. As no other remedies could be suggested, the chairman hoped that the Board of Agriculture and Fisheries would make investigations into this matter, as well as into red rust on roses.

Banbury.

Cold, but bright weather attended the twenty-fifth exhibition of chrysanthemums, winter flowers, fruit, and vegetables, held in the Town Hall on November 16 and 17. Cultivators in the district of the "town of sweet cakes" were in excellent form, the cut blooms being remarkable for their size, and the competition was good throughout. The show was opened by the Hon. Mrs. Molyneux, Bodicote, in the presence of a very distinguished company. The schedule does not provide any class for chrysanthemums in pots, but those reserved for winter-flowering begonias, cyclamens, and foliage plants made a fair show, and the tables of orchids, on twelve-feet square, proved a very attractive feature. Mr. G. F. Hallett, gardener to Lady Hesketh, Easton Neston, Towcester, won the "Banbury Cross" Twenty-guinea Challenge Cup and cash for the third year in succession, and thus becomes the owner. His collection was tastefully arranged, the arching spikes of Oncidium varicosum gracefully depending over the many well-flowered examples of Cattleya Mossiæ, Odontoglossum grande, and other forms, with several stout racemes of Vanda cærulea; Mr. J. M. Bush was placed second for a beautiful arrangement, his Calanthe Veitchi being very bright.

CUT BLOOMS.

Generally these were most effectively staged, and filled the bulk of the central table and side staging. For nine triplets, in vases, a fine exhibition resulted, the "Town Challenge Cup" and cash going to Mr. Bush, gardener to F. J. Myers, Esq., Charlton Lodge, who put up large, well-finished specimens of Madame P. Radaelli, Walter Jinks, Mrs. A. T. Bott, Maud Jefferies, Master James, Marquis of Northampton, Hon. Mrs. Lopes, and Bessie Evans; Mr. G. Hallett, second; and Mr. C. J. Sadler, gardener to Lord Lawrence, Chedwode Manor, third. For a dozen varieties, in vases, cut with long stems, Mr. S. Brown, gardener to W. C. Cartwright, Esq., Aynho Park, filled the post of honour, with some grand blooms, and singularly attractive were Mrs. E. Crossley, Valerie Greenham, F. S. Vallis, F. Penford, W. A. Etherington, Reginald Vallis, Miss Olive Miller, Sapho, and Splendour: Messrs. Bush and Hallett took the lower awards. For eighteen varieties (on boards) the competition was keen, Mr. Bush heading the list with a set of giants: back row: W. Etherington, F. S. Vallis, Magnificent, Marquis of Northampton, Maud Jefferies, Mrs. C. Penford; mid row: Madame P. Radaelli, Master David, Mrs. Barclay, Mr. H. Stevens, Walter Jinks, Mrs. W. Cole; front row: Madame Rivol, G. Hemmings, Miss Nicoll, Lady Talbot, W. King, and Splendour. Messrs. S. Brown, and F. Tapper, gardener to Sir S. Scott, Westbury Park, received lower awards.

For twelve Japanese Mr. Salter was strong, his premiers being the Rev. W. Wilks, Pockett's Surprise, Bessie Godfrey, Frank Payne, and Leslie Morrison; Mr. Brown, second, with replicas of a former class; and Mr. Tapper third, who had very fine examples of Reginald Vallis, Mary Inglis, Lady Henderson, and Pockett's Surprise. For six Japanese, any one variety, the prizes went to Mr. Brown, for Splendour; Mr. F. Carter, gardener to W. G. Peareth, Esq., Thorpe Mandeville, with F. S. Vallis; and Mr. Bush for Bessie Godfrey. For a dozen incurved Mr. Salter held his own with full-sized exquisitely finished examples of Pantia Ralli, Lady Isabel, Emblême Poitevine, W. Pascoe, C. H. Curtis, Hanwell Glory, Daisy Southam, Perle Palace, Louisa Giles, Romance, Comtesse d'Estoile, and Ialene; the lower award falling to Mr. W. J. Florey (schoolmaster), Chipping Warden. For six incurved, one variety, Mr. Hallett scored a premier with Romance, and in the class for six Japanese (amateurs) the prizes went to F. S. Vallis (2) and Mrs. Knox.

FRUIT AND VEGETABLES.

The show of fruit in the Council Chamber was a grand one, the chief point of interest being the dessert tables, the society's challenge cup and cash going to Mr. S. Brown, who utilised single chrysanthemums; Mr. E. Cox, gardener to Lady Knightley, Fawsley Park, and Mr. Bush sharing the lower awards. The show of grapes was an average one, Gros Colmar and Muscat of Alexandria being most in evidence; pears were very fine for the season, and the culinary apples appeared more in character than the dessert kinds.

Vegetables, of which there was a large display, were located in the basement of the building, the big collections being in the hands of Mr. R. Wadham, gardener to Mrs. Bradshaw, Steeple Aston, and Mr. Bush. The onions were of the Ailsa Craig type, and giant leeks and Intermediate carrots were extensively presented; while sprouts, cauliflower, and beet met the view all round. Potatoes were of good useful size, King Edward VII., Mr. Bresee, Factor, Up-to-Date, Duchess of Cornwall, Purple Perfection, Centenary, Sutton's Favourite, Ninetyfold, Dalmeny Beauty, and Windsor Castle being most largely represented.

Croydon Gardeners' Association.

Of the many great improvements observable in plant life of late years there is nothing more prominent than the hybrids of amaryllis we have at the present day. The whole history of this great improvement in these lilies was dealt with at this society's last meeting, and the society were fortunate in getting one of the most successful cultivators, in the person of Mr. J. Heal, of Messrs. Veitch's Royal Nurseries, Chelsea, S.W., to lecture upon the subject.

The lecturer brought under notice the whole family of amaryllis, but dealt principally with the hippeastrums. In the early part of last century the hybridising of these flowers received attention, and what was considered a great achievement about 1824 was the successful crossings and re-crossings by Dean Herbert, who claimed to have thirty-five different crossings. However, when one compares illustrations of these flowers with those of to-day they are insignificant in colour and size, as well as shape. Skipping a period of fifty years, during which time nothing eventful had taken place, we find other cultivators specialised with them, especially horticulturists of the Netherlands. It was at the establishment of one of these growers that the lecturer first acquired his enthusiasm, for on a business visit for Messrs. Veitch he observed several plants quite in advance to what he had previously seen, and coming back with a few bulbs he set to work hybridising and selecting. Like all lovers of the craft, he has received reverses as well as successes, and these reverses have fostered in his mind a keener love of his charges than perhaps would have been the case. It was interesting to hear him remark that since his commencement with their culture Messrs. Veitch had obtained 110 awards of merit.

Dealing with their culture, he advised the preparation of the soil, giving each component part, and advising the mixing of these soils five to six months before using. The bulbs should be well ripened, and clean from decayed roots and soil. Potting should commence in January, about the second week, and at a little later period another batch may be started. Plunge the pots in tan at a temperature of 60 degrees, with the house temperature five degrees lower. The temperature of the house can then be raised to 60 degrees, and great care must be taken in watering. The latter part of the cultivation appears to be one requiring the most care, for unless the water is given judiciously trouble will result.

Propagating by bulbs and seeds was freely dealt with, and when stock is worked from seeds it will require about two years to obtain flowers, although in Mr. Heal's experience he had obtained flowers in considerably less time. It is not always advisable to allow them to flower each year, for a twelve months' rest will help very much to build up the bulb, and then the results from the following year will amply repay waiting.

Thrip and red spider are the two commonest forms of insect pests which the cultivator has to combat, but with the many good insecticides at one's disposal nowadays these can be kept in check.

Mr. Heal generously offered to answer any questions from his audience, and the information derived from this source considerably augmented his treatise, because it brought out the very information required where success had not been experienced by the cultivators. The lucid and practical manner in which Mr. Heal had given his lecture was exceedingly interesting, and his audience in unanimous spirit accorded him a hearty vote of thanks.

Mr. O. Jeal exhibited three heads of Standard Bearer celery, and Mr. R. Cleveland staged a basket of Black Hamburgh grapes cut from the open air.

Birmingham Gardeners' Association.

"Some Features of the Birmingham Chrysanthemum Show" was the title of a talk by Mr. William Spinks (the treasurer of the Gardeners' Association) at the Athletic Institute, on November 14; Mr. C. H. Herbert occupied the chair, and there was a good attendance. At the same meeting there was, in response to the prizes offered by the society for a vase of cut flowers by under-gardeners only, a keen contest by four aspirants, each having chosen chrysanthemums, and considerable ability in the disposal of the flowers was evidenced throughout. The contestants were placed in the order named: Mr. R. Clark, Mr. P. Catt, and Mr. Kemp.

Mr. Spinks dealt with his subject in a very interesting and suggestive manner, and more or less adverted to nearly every prize exhibit, and to the non-competitive and trade contributions. Upon the conclusion of his congenial task Mr. Spinks invited a discussion, and suggestions for the consideration of the Chrysanthemum Show Committee, in view of next year's schedule. Mr. Walter Jones (the chairman) and Mr. Alfred Noakes (the secretary of the show) were present, and the former animadverted upon the extremely low financial position of the society, and his great disappointment at the comparative lack of support by wealthy occupiers of large gardens around Birmingham, and that unless a more substantial financial support was quickly forthcoming, he feared a collapse would be the result ere long, and the imminence of which is accentuated by the serious deficit in the "gate" receipts at the recent show, chiefly owing to the adverse weather. Mr. Noakes, in acknowledging the various suggestions advanced, remarked that due consideration would be given them.

At the conclusion of the proceeding Mr. W. Gardiner (the librarian) essayed as a fitting concomitant to the subject of the evening's discourse to read (more especially for the edification of the younger members of the association) the life history of the respected treasurer of the association (he has been treasurer from its initiation, upwards of twenty years ago). The narration was much appreciated, and Mr. Spinks, with characteristic modesty, intimated that Mr. Gardiner was solely responsible for the course he had taken.

Mussænda erythrophylla.—This stove shrub was introduced from the Congo district over 20 years ago, and anticipations were then freely indulged in as to its probable highly decorative value. It, however, proved in most cases so shy-flowering that it gradually dropped out of cultivation. True, it has within recent years flowered at Kew, but that is the only place I have met with it in bloom till on a recent visit to Messrs. Veitch's nursery at Feltham. I found it there in good condition. It is not the blossoms themselves that form the showy part of the inflorescence, but the large leaf-like bracts of a bright red colour which subtend them. If it can be induced to bear these bracts more freely than it has hitherto done, it may yet become a popular plant in gardens.—W. T.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

STOVE AND GREENHOUSE PLANTS.—B. W., Walsall: A very useful book of the kind you need is "Greenhouse and Stove Plants," written by the late Mr. Thomas Baines, and published by John Murray.

INFESTED GRAPES.—J. G. W., Stoke: We received the second parcel, and the mites we found were those so usually found upon decaying vegetation. We think, as before stated, that the cause of the trouble must be sought elsewhere. Examine some of the roots and see whether there are any insects upon them.

STRAWBERRIES ON SMALL HOLDINGS.—A. C. J., Bucks: Owing to the extent to which strawberries exhaust the land, and to the risk of damaging the bed by subsequent manuring, the soil must be well manured at the outset. As much as twenty to thirty tons of good short dung may be applied per acre when the bed is formed, and ten tons in the autumn after the second crop is taken. Bone manure may be substituted for the latter dressing, but artificial manures are not in general use. The cost of farmyard or town manure may be put at about 6s. 6d. per ton, and in addition 2s. per ton for haulage to the ground, and from 2s. to 3s. per acre for spreading, must be allowed, so that the average cost of manuring will work out to something like £9 to £12 per acre.

CHRYSANTHEMUM SPORT.—E. W. K., Bath: We recently saw some flowers of the type, and so are able to say that yours is a sport, but whether a similar sport is in the hands of other people we do not know. Your best plan would be to approach some chrysanthemum specialist on the matter both in relation to the distinctness of the sport, its possible value as an introduction, and means of distribution. A specialist can usually manage anything in his line far better than a general dealer, unless the latter has a very wide clientele.

MEAGER ON PLUM TREES. — S. J., Waterford: We happen to have a copy of "The New Art of Gardening," by Leonard Meager, and so are able to answer you at once. Under the title of "Plumb Trees, and How to Order Them," he writes:—"Plumb-trees are Planted from the Middle of Winter, to the Ides of February; but if you set the Stones soon after the fall of the leaf, let it be done in November, in a good and mellow ground, two handfuls; they may be also set in February, but then they must be steeped in lye three days, that they may the sooner spring; they are also planted from the young sets that grow from the body of the tree either in January or the beginning of February the roots being well covered with dung; they prosper best in a rich and moist ground, and in a cold country they are grafted towards the end of March, and are better in a cloven stock than the bark, or else in January, before the gum begins to drop out; it is grafted upon his own stock, the Peach and the Almond. There are several sorts of Plumbs, whereof the Damsen is not the least esteemed, joying in a dry ground, and in a hot country; it is grafted as other Plumbs are. There are divers coloured Plumbs, white, black, purple, and red, Wheat-plumbs and Horse-plumbs; the Finger-plumbs are most commended, bearing near the length of a man's finger, and blue in colour, but later. The Damsens may be dryed in the sun upon lattises, leads, or in an oven; some do dip them before, either in sea-water, or in brine, and after dry them."

WATERING COOL ORCHIDS.—L.C.C., Brentwood: At this season of the year cool orchids should be watered with great care, or trouble will be sure to follow. Watering should be done on a bright day, and as early in the day as possible provided the inside temperature has risen to the proper degree for the day, and also provided the water used is rather over than under the maximum day temperature for the house. Under these conditions give every plant that needs it a good watering so as to thoroughly wet every portion of the rooting material. Whatever may be said for the practice of standing the pots directly upon the ashes or other material that covers the stages (we do not recommend it at any season, however) during spring and summer, it is very necessary that during winter the plants should be raised well above the moisture-holding material by means of inverted pots or a movable trellis stage. This will allow the moisture applied directly to the plants to pass through the potting material quickly, and this is an important matter in the dull season. Handle all the plants frequently, remove any excessive sphagnum growth, as well as dead and decaying leafage.

FAILURE OF PLANTS IN CONSERVATORY.—R. E., North Finchley: It is quite possible that the paint has a great deal to do with the failure of the plants. The odour of paint is distasteful to plants, and especially so if the paint is an arsenical one. When the paint has become perfectly hard the trouble will, no doubt, cease. Remove the plants, turn on all the heat possible, and freely ventilate the house so that the paint may become thoroughly dry before returning the plants to it.

NAMES OF PLANTS.

W. A. M., Nottingham.—1, Pteris Wimsetti; 2, P. tremula Smithi; 3, not recognised; 4, Davallia dissecta.

L. M. E., Bournemouth.—1, Cypripedium Leeanum giganteum; 2, C. Spicerianum; 3, C. Actæus; 4, C. Euryades.

T. L. L., Sevenoaks.—1, Begonia fuchsioides; 2, Calanthe Veitchi; 3, Salvia azurea; 4, Oncidium crispum.

S. F., Bedeford.—1, Symphoricarpus racemosus; 2, Olearia Haasti; 3, Spartium junceum; 4, Trachycarpus excelsa; 5, Erica herbacea.

A. E., Mill Hill.—1 and 2, Cattleya labiata, the former is the best variety; 3, Cattleya Loddigesi; 4, C. Bowringeana; 5, Cypripedium insigne; 6, C. Spicerianum.

NAMES OF FRUITS.

J. F., Badminton.—1, Mère de Ménage; 2, Alfriston.

B. G. C., Worcester. — Waltham Abbey Seedling.

K. W. E., Wendover.—1, King of the Pippins; 2, Lord Derby.

G. A., Horsham.—1, Beurre Bachelier; 2, Beurre Diel; 3, Bergamot Esperen; 4, Lane's Prince Albert.

T. W. T., Southampton.—1, Baumann's Red Winter Reinette; 2, Yorkshire Beauty; 3, Allington Pippin; 4, Bramley's Seedling.

C. T. J., Axminster.—1, Loddington; 2, Bismarck; 3, Smart's Prince Arthur; 4, Cox's Orange Pippin; 5, Catillac; 6, Beurre Rance.

GARDENING APPOINTMENT.

Mr. R. Winter, formerly at Avishays House Gardens, Chard, has been appointed head gardener to Mrs. Harriss, at Three Ashes House, Cold Norton, near Maldon, Essex.

FORTHCOMING ENGAGEMENTS.

THURSDAY, December 1.—Colonial Fruit Show at the Royal Horticultural Hall, Westminster; three days.

SATURDAY, December 3.—French Horticultural Society of London.

Situations Wanted.

MR. E. R. BEVAN highly recommends his late HEAD GARDENER; 13 years in his service; life experience in all branches; most capable and trustworthy; 39; married, one child. H. KING, Rempstone, Corfe Castle.

GARDENER (Head, where several are kept); thoroughly experienced in all branches, inside and out; grapes, peaches, melons, stove and greenhouse plants; four-and-a-half and eleven years' excellent references as head; married, family out. E. STONE, 13, Coniston Road, Addiscombe, Croydon, Surrey.

GARDENER (Head); life's practical experience in all branches, Inside and Out. Grapes, Peaches, Melons Stove and Greenhouse Plants, Malmaison and Tree Carnations, Orchids, Chrysanthemums, Landscape, and Rock Garden, Vegetables and Hardy Fruits; nearly eight years as head of six; excellent references; age 35. F. SMITH, 4, Mellish Terrace, Morden, Surrey.

GARDENER (Head Working or Single-handed); life experience in Fruit, Flowers, and Vegetables, both Inside and Out; excellent references; disengaged; married, three in family. PEARCE, Herriard, Basingstoke.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here 5½ years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working); life good practical experience in all branches, Inside and Out, Early and Late Forcing; excellent references. H. TURNER, 62, Star Road, Peterborough.

GARDENER (Head Working), requires SITUATION; experienced in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants; Flower and Kitchen Garden, Hardy Fruit, etc.; good references; married, no family. W. S., 73, Allen Street, Maidstone, Kent.

GARDENER (Head Working), age 45; married, no family; experienced in all branches (Inside and Out); excellent testimonials. WM. SMITH, care of Mrs. Clibury, Weather Lane, Astley, Stourport.

GARDENER (Head Working, where two or more are kept); good all round; can be well recommended; married when suited; age 36. PEARCE, 10, Roxwell Road, Shepherd's Bush.

WANTED, SITUATION as HEAD WORKING GARDENER, where two or more are kept; lifelong experience in all branches, inside and out; also landscape work; Churchman; abstainer; excellent references; married; one child; North of England preferred; age 30. Apply GARDENER, care of Hy. Wardhaugh, Shotley Bridge, Durham.

GARDENER (Head Working).—H. ESSAM can with confidence recommend his Foreman, where several are kept; life experience in all branches; age 30; married when suited; excellent references. Address Closes Hall, Gisburn, Clitheroe.

GARDENER (Head Working) requires SITUATION; experienced Vines, Peaches, Melons, Fruit, Flowers, Vegetables; 5 years' good character; married. C. N., Clarence Cottage, Broadbridge Heath, Horsham.

GENTLEMAN recommends GARDENER (Head of two or three); life experience in all branches; understands formation of new or renovating old gardens; married, one boy 10 years; age 45. PENNELLS, Phœnix Green, Winchfield, Hants.

GARDENER (Single-handed or otherwise); good all-round man in all branches, or handy man on gentleman's estate; good at either; willing to be useful; active and reliable; good character; age 45; married, one child. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER (Single-handed), or as good all-round Hand on large establishment; well experienced Inside and Out; age 30; Single; excellent testimonials. GARDENER, 197, High Road, Wood Green, N.

WANTED, Re-engagement as MANAGER or FOREMAN GROWER; 30 years wide experience. Present situation Manager of over 2,000 feet run of Houses; an expert Cucumber Grower. Other specialities, Vines, Figs, Peaches, Melons, Tomatoes, Chrysanthemums, Seakale; good knowledge of outdoor fruit. Satisfactory reasons given for leaving. F. G., Office of this Paper.

C. W. CATT, Esq., will be pleased to recommend his SECOND GARDENER to any lady or gentleman; a thoroughly trustworthy and energetic Man, as Head Working Gardener, where 3 or 4 are kept; his credentials are of the highest order. Full particulars on application. Outwoods Gardens, Duffield, Derby.

SECOND GARDENER seeks SITUATION in good establishment where several are kept; well up in vines, peaches, melons, stove and greenhouse plants, including carnations and chrysanthemums; well recommended. Apply S. C. LOCK, Village Benenden, Cranbrook, Kent.

GENTLEMAN recommends YOUNG MAN, age 22, as Second of four or five; Inside and Out; 7 years' experience; good reference. Apply T. ROGERS, Michelmersh, Romsey, Hants.

GARDENER; good all-round; middle age; 25 years' good references; wife take charge of house when family away; clergyman's references. SEX, 2, Radley Lane, S. Woodford, Essex.

JOURNEYMAN (Inside and Out) or GARDENER (single-handed); good hand with scythe; age 27; total abstainer; single; good references; free when suited. JAMES BROWN, The Gardens, Otterburn Hall, Northumberland.

M. MEREDITH BROWN, Esq., strongly recommends young man as JOURNEYMAN (Second, Inside); 3½ years present place; age 20. F. GEE, Westbrook, Bromham, Chippenham.

GARDENER (Under, Inside and Out) seeks SITUATION in Esher or surrounding districts; two years last situation. C. CULVER, 3, Wotton Cottages, West End, Esher, Surrey; no Bothy.

UNDER GARDENER and JOURNEYMAN, Inside and Out; 2½ years' present, 3½ previous; age 22; good references. C. G. STEVENS, 10, Clinton Road, Leatherhead.

IMPROVER.—GEO. PICKER, The Gardens, Hesslewood, near Hull, can recommend HERBERT HESSY, as Improver; had nearly 4 years' experience (Outside and Inside); age 18 years. Apply as above.

ESTATE JOINER requires SITUATION; can undertake to keep Property in thorough repair and to collect rents if required; best references. W. E. S., 18, Carrs Hill, Gateshead-on-Tyne.

IF any Lady or Gentleman requiring a really capable GARDENER (Head) will apply to HEATH and SON, Alpine Botanic Gardens, Cheltenham, full information will be given of a man wishing to leave his present employer; he is thoroughly efficient and is very industrious, and has had charge for some years of one of the best known and choicest collections of Hardy Plants and Rare Trees in this country; previously to which he held a responsible position at Kew; he could move at any time by giving the ordinary notice.

LANDSCAPE FOREMAN, being under an Editor on Gardening for a number of years, seeks a SITUATION with Lady or Gentleman to lay out new Garden or improve old; excellent references; married; middle age. W. B., 31, Queen's Road, Horley, Surrey.

MAN (43) seeks SITUATION in Nursery (Outside or In); experience in chrysanthemums, tomatoes, roses, shrubs; clerical work if required; 3 years' experience; abstainer; good references. B. S., Bethany, Rowlands Road, Worthing.

SITUATION required to look after Pony and Trap, help in Garden, and generally useful; good references; age 21. E. WEBB, Crowsley Park Lodge, Harpsden, Henley-on-Thames.

YOUNG MAN, age 21, seeks SITUATION in large garden (Inside or Out), Kitchen Garden or Pleasure Grounds; 8 years' general experience; excellent references; Bothy preferred. Write GARDENER, c/o Wardley's Stationery, Mill Street, Guernsey.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Deep Cultivation.

Some of our readers will probably remember the story they read in their younger days of the old man who, feeling that his life's work was done, called his sons about him, and bid them search diligently in the garden for hidden treasure. The sons acted upon the advice given them by their father, and in their search they dug over the garden to a depth far exceeding anything that had previously been known, but they were disappointed in not finding, as they anticipated, treasure of gold or silver. They were not, the story proceeds, without their reward, for in the following year the crops were so enormous as to leave no doubt in the minds of the sons as to what their father meant when he gave them the advice. This simple story, which belongs to the far distant past, is of interest as showing that the importance of deep cultivation in the production of garden crops is not a present-day discovery, but was recognised, to some extent, at a time when gardening had not attained to a very high position in the estimation of the community at large. At the present time the deep stirring of the soil is generally regarded as an essential part of good cultivation, and it forms part of the regular practice of all who have achieved any considerable degree of success in garden management. There are some whose experience has not been sufficient to enable them to fully appreciate the value of deep cultivation, and there are those who do not clearly understand the conditions under which it can be carried out with the greatest advantage to the various classes of useful crops and ornamental plants, and a brief reference to the subject at the present time can hardly fail to prove useful. As a general proposition, it may be stated that all the vegetable crops and hardy herbaceous plants attain to a higher state of development when occupying beds and borders that were deeply trenched previous to their being sown or planted, and that fruit trees and ornamental trees and shrubs make the most satisfactory growth when the ground has been prepared by trenching, than where the soil preparation has been limited to ordinary digging. Therefore, trenching should be regarded as an essential part of the routine work, both in kitchen and flower gardening, and where, as in the majority of gardens, it is not practicable to trench the whole of the area each year, as large a portion as possible should be trenched. The advantage of this method of soil preparation, as compared with digging to a depth of twelve inches or so, are, briefly summarised, so great an increase in the depth of the soil as to enable a considerable proportion of the roots to push down deep enough to be beyond the influence of short periods of drought, a doubling at least of the area over which the roots can extend in search of food, the greater facility afforded for the passage of rain water through the soil, and the improvement in capillarity the latter a point of much importance to the plants in dry weather. Opinions differ somewhat as to the manner in which ground should be trenched, with a view to ensure the highest degree of success. There is a general agreement as to the desirability of trenching to a depth of not less than two feet, but there is a difference of opinion as to whether the bottom spit should be brought to the surface, or be merely broken up where the subsoil is a strong clay. The majority of cultivators hold decided views as to the advantage of simply turning over and well breaking up the top spit, and then forking over the bottom spit, and incorporating with it any partly-decayed manure, vegetable refuse, and gritty matter that may be available. Other cultivators consider the practice of bringing the bottom spit to the surface in all cases as the better of the two, and the position to which they have attained justify their opinions being treated with the greatest respect. With regard to the latter, it is probable that in the statement of their views upon this important point they have not in their mind, unless we are much mistaken, strong clays that have not been broken up to a depth exceeding twelve inches many times, if at all, but a heavy soil that has been deeply cultivated for a considerable number of years. If a soil of the latter description is trenched during the autumn, or at the commencement of the winter, and left in a rough state on the surface, the frosts, rains, and winds will so break it down as to render it comparatively easy to secure a good tilth, more especially if liberal supplies of old potting soil, decayed manure, leaf-mould, and similar materials be spread over the surface, and forked in to a depth of six or eight inches. But if a soil resting on clay within twelve or fifteen inches of the surface is trenched, and the bottom spit brought to the surface, the soil which had been so ameliorated by cultivation and exposure to atmospheric conditions as to enable the roots to run freely through it, will be buried to a depth that practically places it beyond their reach. Some thirty years or so ago the deep trenching of both heavy and light soils was strongly recommended,

MR. J. WHITTLE.

without any qualifications, and we remember many quarters that were rendered of comparatively little use for a year at least owing to the advice having been blindly followed, and the ameliorated soil buried below a layer of tenacious clay. The proper course is to trench to a depth of not less than two feet, and if there is good soil throughout, reverse the top and bottom spit, well breaking up the soil in the process. Should, on the other hand, the soil be heavy, but considerably ameliorated by previous cultivation, bring the bottom spit to the surface, and apply a good dressing of light material in the spring, and well mix it with the surface. Then, in the case of the clay subsoil, allow it to remain in the bottom, until it has been greatly improved by the methods of amelioration that find favour in good gardens.

Mr. J. Whittle, whose portrait we have the pleasure of giving in this issue has during the past five years been in charge of the gardens of Chevening, Maidstone, the residence of Lieut.-Colonel Borton, and during this period he has specially distinguished himself as a cultivator and exhibitor of hardy fruits, in which his employer takes much interest. As will be remembered by those who visited the Royal Horticultural Society's exhibition of British-grown fruits in October last, or read our report of the show, Mr. Whittle was successful in occupying the first place in the great class for thirty dishes of hardy fruits, and in several of the principal classes for apples, staging in all cases fruit equally remarkable for its large size and superb finish. Mr. Whittle's successes have been such as to afford the best possible proof of his having had the advantage of a thorough training in the art of gardening, and it is a matter of some interest to mention that in his probationary period he occupied positions in the gardens of Park Hall, Oswestry; Culford Hall, Tring Park, and Cowley Manor, and that for several years he was general foreman in the gardens of Mote Park, Maidstone, where hardy fruit is grown with much success. The successes of Mr. Whittle as an exhibitor of hardy fruit would form a somewhat lengthy list, and for the present purpose it will suffice to mention that he has been awarded six Hogg Memorial medals, of which two were silver-gilt; the Worshipful Company of Fruiterers' silver-gilt medal, and the Veitch Memorial medal. At the last three fruit shows held by the Royal Horticultural Society Mr. Whittle has been first in the class for thirty dishes of hardy fruit; and at each of the last four exhibitions he obtained the premier award for twenty-four dishes of apples, distinct varieties; for six dishes of culinary apples; and for six dishes of dessert apples, a record of which any fruit-grower might justifiably feel proud.

National Sweet Pea Society.—The annual general meeting of this society will be held in the North Room, Hotel Windsor, Victoria Street, Westminster, S.W., at 3 p.m. on Thursday, December 15, 1910. A presentation of silver plate will be made to Mr. and Mrs. Charles Foster on this occasion. A Sweet Pea Conference will also be held at the Hotel Windsor on the above date, commencing at 7 p.m., when the following papers will be read: "Judging Sweet Peas," by Mr. Walter P. Wright; and "Cultivation of Sweet Peas," by Mr. George Herbert. For the convenience of members dinner will be provided at the Hotel Windsor at 5.30 p.m. on the above date. Tickets, 5s. each (exclusive of wine). Application for tickets must be made to the Hon. Secretary, Adelaide Road, Brentford, Middlesex, not later than December 14

Sale of Poisonous Insecticides.—In the Winchester County Court the Pharmaceutical Society of Great Britain brought a claim against Mr. C. W. Breadmore, of Winchester, for the recovery of £5, the amount of a fine imposed upon him by the society for the alleged non-compliance with the Pharmacy Act of 1908, by not affixing his name to a bottle of "XL All Insecticide." The case was heard at considerable length, and Mr. George Waldock, the representative of the society, stated that on July 13 he purchased at Mr. Breadmore's shop, a bottle of insecticide, and that the bottle did not bear the name and address of the seller. Mr. W. C. Connett, the assistant who sold the bottle, said he was certain the bottle was labelled. Mr. E. Newton, another assistant, gave evidence with reference to receiving the consignment of the insecticide from the manufacturer, and said the bottles would not be put into stock without being labelled: and Head Constable Sim, the inspector under the Pharmacy Act, stated, in his evidence, that he had paid three surprise visits to Mr. Breadmore's premises since October, 1909, and examined the bottles and tins, and saw they were all properly labelled. His Honour gave judgment at considerable length, and stated that on the evidence he was satisfied the bottle in question was sold with the label, and that judgment would be for the defendant, with costs.

Electrical Control of the Weather.—Mr. S. Z. de Ferranti, president of the Institution of Electrical Engineers, evidently holds highly optimistic views of the development of electrical science. In the course of his inaugural address, which was delivered the other evening, he said it would be a desirable thing if, instead of the dark weather that we now often experienced owing to cloud obstruction, we could have continuous sunshine at certain times of the year. The amount of sunshine would, no doubt, be largely increased by the abolition of all smoke in the air, as not only did smoke itself obscure the sun, but also it seemed to have the effect of assisting the formation of cloud, which greatly diminished the light and heat we received. He believed that the time would come when it would be thought no more wonderful largely to control our weather than it was now thought wonderful to control the water after it had fallen on the land. He thought that it would be possible to acquire knowledge which would enable us largely to control by electrical means the sunshine which reached us, and in a climate which usually had ample moisture in the atmosphere to produce rainfall when and where we required it. It might be possible, when we knew a great deal more about electricity than we did to-day, to set up an electrical defence along our coasts by which we could cause the moisture in the clouds to fall in the form of rain, and so prevent these clouds drifting over the country between ourselves and the sun, which they now blotted out. It also seemed to him that it would be possible, when more water on the country was required, to cause the falling of rain from the clouds passing over the highest part of the country, and so produce an abundance of water which, properly used, would greatly add to the fertility of the country.

R.A.S.E. Flower Show at Norwich.—The Royal Agricultural Society will, in accordance with the custom that has obtained for several years past, hold a flower show in conjunction with its great exhibition, which will be held at Norwich during the last week of June next. The schedule contains twelve open classes, and these are for groups of miscellaneous plants, collections of orchids arranged for effect, groups of carnations (cut blooms and plants), groups of tuberous begonias, displays of herbaceous flowers, bamboos, lilies, and foliage, either cut or in pots, collections of stove and greenhouse plants, of cut sprays of carnations, of cut hardy perennials, of cut roses, of sweet peas, and of vegetables, and for decorative displays of ripe fruit. The prizes for miscellaneous plants are £30, £25, and £20; for displays of herbaceous flowers, £20, £15, and £10; and for displays of ripe fruit, £20, £15, and £10. In addition thirteen classes are provided for cut flowers, fruits, and vegetables, in which the competition is limited to members of the Norwich Horticultural Society. Of these classes seven are for roses, one each for carnations and sweet peas, two for hardy perennials, and one each for collections of fruit and vegetables. The exhibition of the contributions to the open classes will open on Tuesday, June 27, 1911, and be continued until the following Friday, and the exhibition of local flowers, fruits, and vegetables will be held on June 29 and 30, 1911. The manager of the horticultural section is Mr. Peter Blair, Trentham Gardens, Stoke-on-Trent.

Sweet Pea Trials in 1911.—The National Sweet Pea Society will hold its annual series of trials at the "Times Experimental Station," Sutton Green, near Guildford, in 1911, and will test novelties and grant awards and certificates according to merit. No awards or certificates will be granted to sweet peas unless they are sent for trial at Guildford. For these trials the varieties will be accepted only from the raiser or introducer. A charge of 2s. 6d. for each variety will be made. Orange and salmon-coloured varieties will be shaded if the raiser or introducer expresses a wish that they should be so treated. A further trial, solely for the purpose of testing correctness and purity of stocks of sweet peas, will also be held, and a charge of 10s. per variety or stock will be made. Sweet peas for these trials must reach Mr. Charles Foster, "Times Experimental Station," Sutton Green, near Guildford, not later than January 14, 1911, and in every instance the colour class to which the variety belongs should be stated. For the novelty trials not less than fifteen seeds should be sent, and for the purity trials not less than two dozen seeds of each variety or stock. At the same time a list of the varieties, together with the amount due for trial charges, must be sent to the hon. secretary, Mr. C. H. Curtis, Adelaide Road, Brentford, Middlesex.

The Cooking of Vegetables is so important a matter in the economy of the household that the lecture on this subject by Mr. C. Herman Senn at the general meeting of the Royal Horticultural Society on Tuesday next should be of much interest. If the interest shown is proportionate to the importance of the subject the lecture room will be crowded.

WATERING CARNATIONS IN WINTER.

The old adaptation that "Good waterers are born, not made," is, to a certain extent, true, and there are many more growers of carnations who imagine that they know all there is to be known about this art, than there are those who possess the actual knowledge. An observant grower, however, can, by close observation and the application of common sense, quickly become proficient in the art, an art which everyone who grows flowers, from the chief in the Botanical Gardens to the old lady who uses a tea pot, think they thoroughly understand.

Everything depends upon the climatic conditions and season of the year. Carnation plants, if growing vigorously and blooming profusely, require considerable water in winter, whereas, on the other hand, plants which were overpotted or potted late, or in unsuitable soil, and hence suffer from weak root action, do not require much water. It is between these two extremes that the difficulty lies.

No carnation plant should be kept perpetually wet or perpetually dry, and it is the craftsman who can discriminate between these, who most appreciates the root action of the plant, and the means by which it grows. Excessive moisture not only enfeebles the root action, but invariably turns the soil sour and useless, whilst excessive drought checks the root action, and the plant is then unable to properly absorb the moisture when it is given.

During the dull season of the year greater care has naturally to be exercised, and the selection of suitable days studied. No plant ever wanted more water simply because it is Saturday and the waterer is doing Sunday duty. To water heavily upon dull rainy days is sheer ignorance, or foolishness, simply because little or no evaporation through the leaves is in progress. Few of us realise that half the moisture absorbed by a carnation transpires through the leaves, and does not actually go to build up the growth.

Evaporation through the leaves of carnations goes on more quickly in summer than in winter, and also on bright days more than on dull ones, consequently we must be ever on the guard against excess of moisture in dull weather, particularly so in the case of plants not in the most vigorous health.

In the early mornings of bright days is when the bulk of the watering should be done, so that any moisture is dried from the foliage by night, and the air of the greenhouse becomes reasonably dry, thus avoiding risk of fungoid diseases. It is always wise to admit some air to the house when watering during the winter, on account of any steam that may arise from the pipes, although excessive fire heat should be avoided in a carnation house, as it creates the wrong atmosphere, and dries out the plants near to it too quickly.

Artificial feeding of carnations before the new year is the cause of all too many failures. A plant must be in an exceptionally vigorous state to require artificial manure during October, November, or December, whilst even then your house must be light and airy, and situated in a bright country district. The whole policy of this early winter feeding is like working for a temporary success—which never pays.

Montagu C. Allwood.

Bush Hill Park.

PELARGONIUM HIS MAJESTY

When the fine new zonal pelargonium named His Majesty gained an Award of Merit, on the occasion of the Royal Horticultural Society's meeting, November 23, 1909, those who saw the flowers of it agreed that for brilliance, size of bloom, and size of truss it was splendid for the time of year, but cautious people were not satisfied that the variety would prove wholly successful for winter flowering, and so withheld their verdict. If they had seen the plants in flower at Mr. W. H. Page's nursery, at Hampton, at that time, they would have been quite satisfied, and if they saw the large, freely-flowered specimens this clever grower staged at the Royal Horticultural Hall on November 22 last they would, with all others who saw them, have become convinced that His Majesty is a pelargonium well worthy of its name, and a famous variety from every point of view for flowering during the winter season. Many individual blooms are over three inches in diameter, and their brilliant deep crimson-scarlet colouring is enhanced by the neat white eye to each flower. Our illustration represents one of the specimens from the Tangley Nurseries, as shown by Mr. Page, and it measured nearly a yard through.

PELARGONIUM HIS MAJESTY.

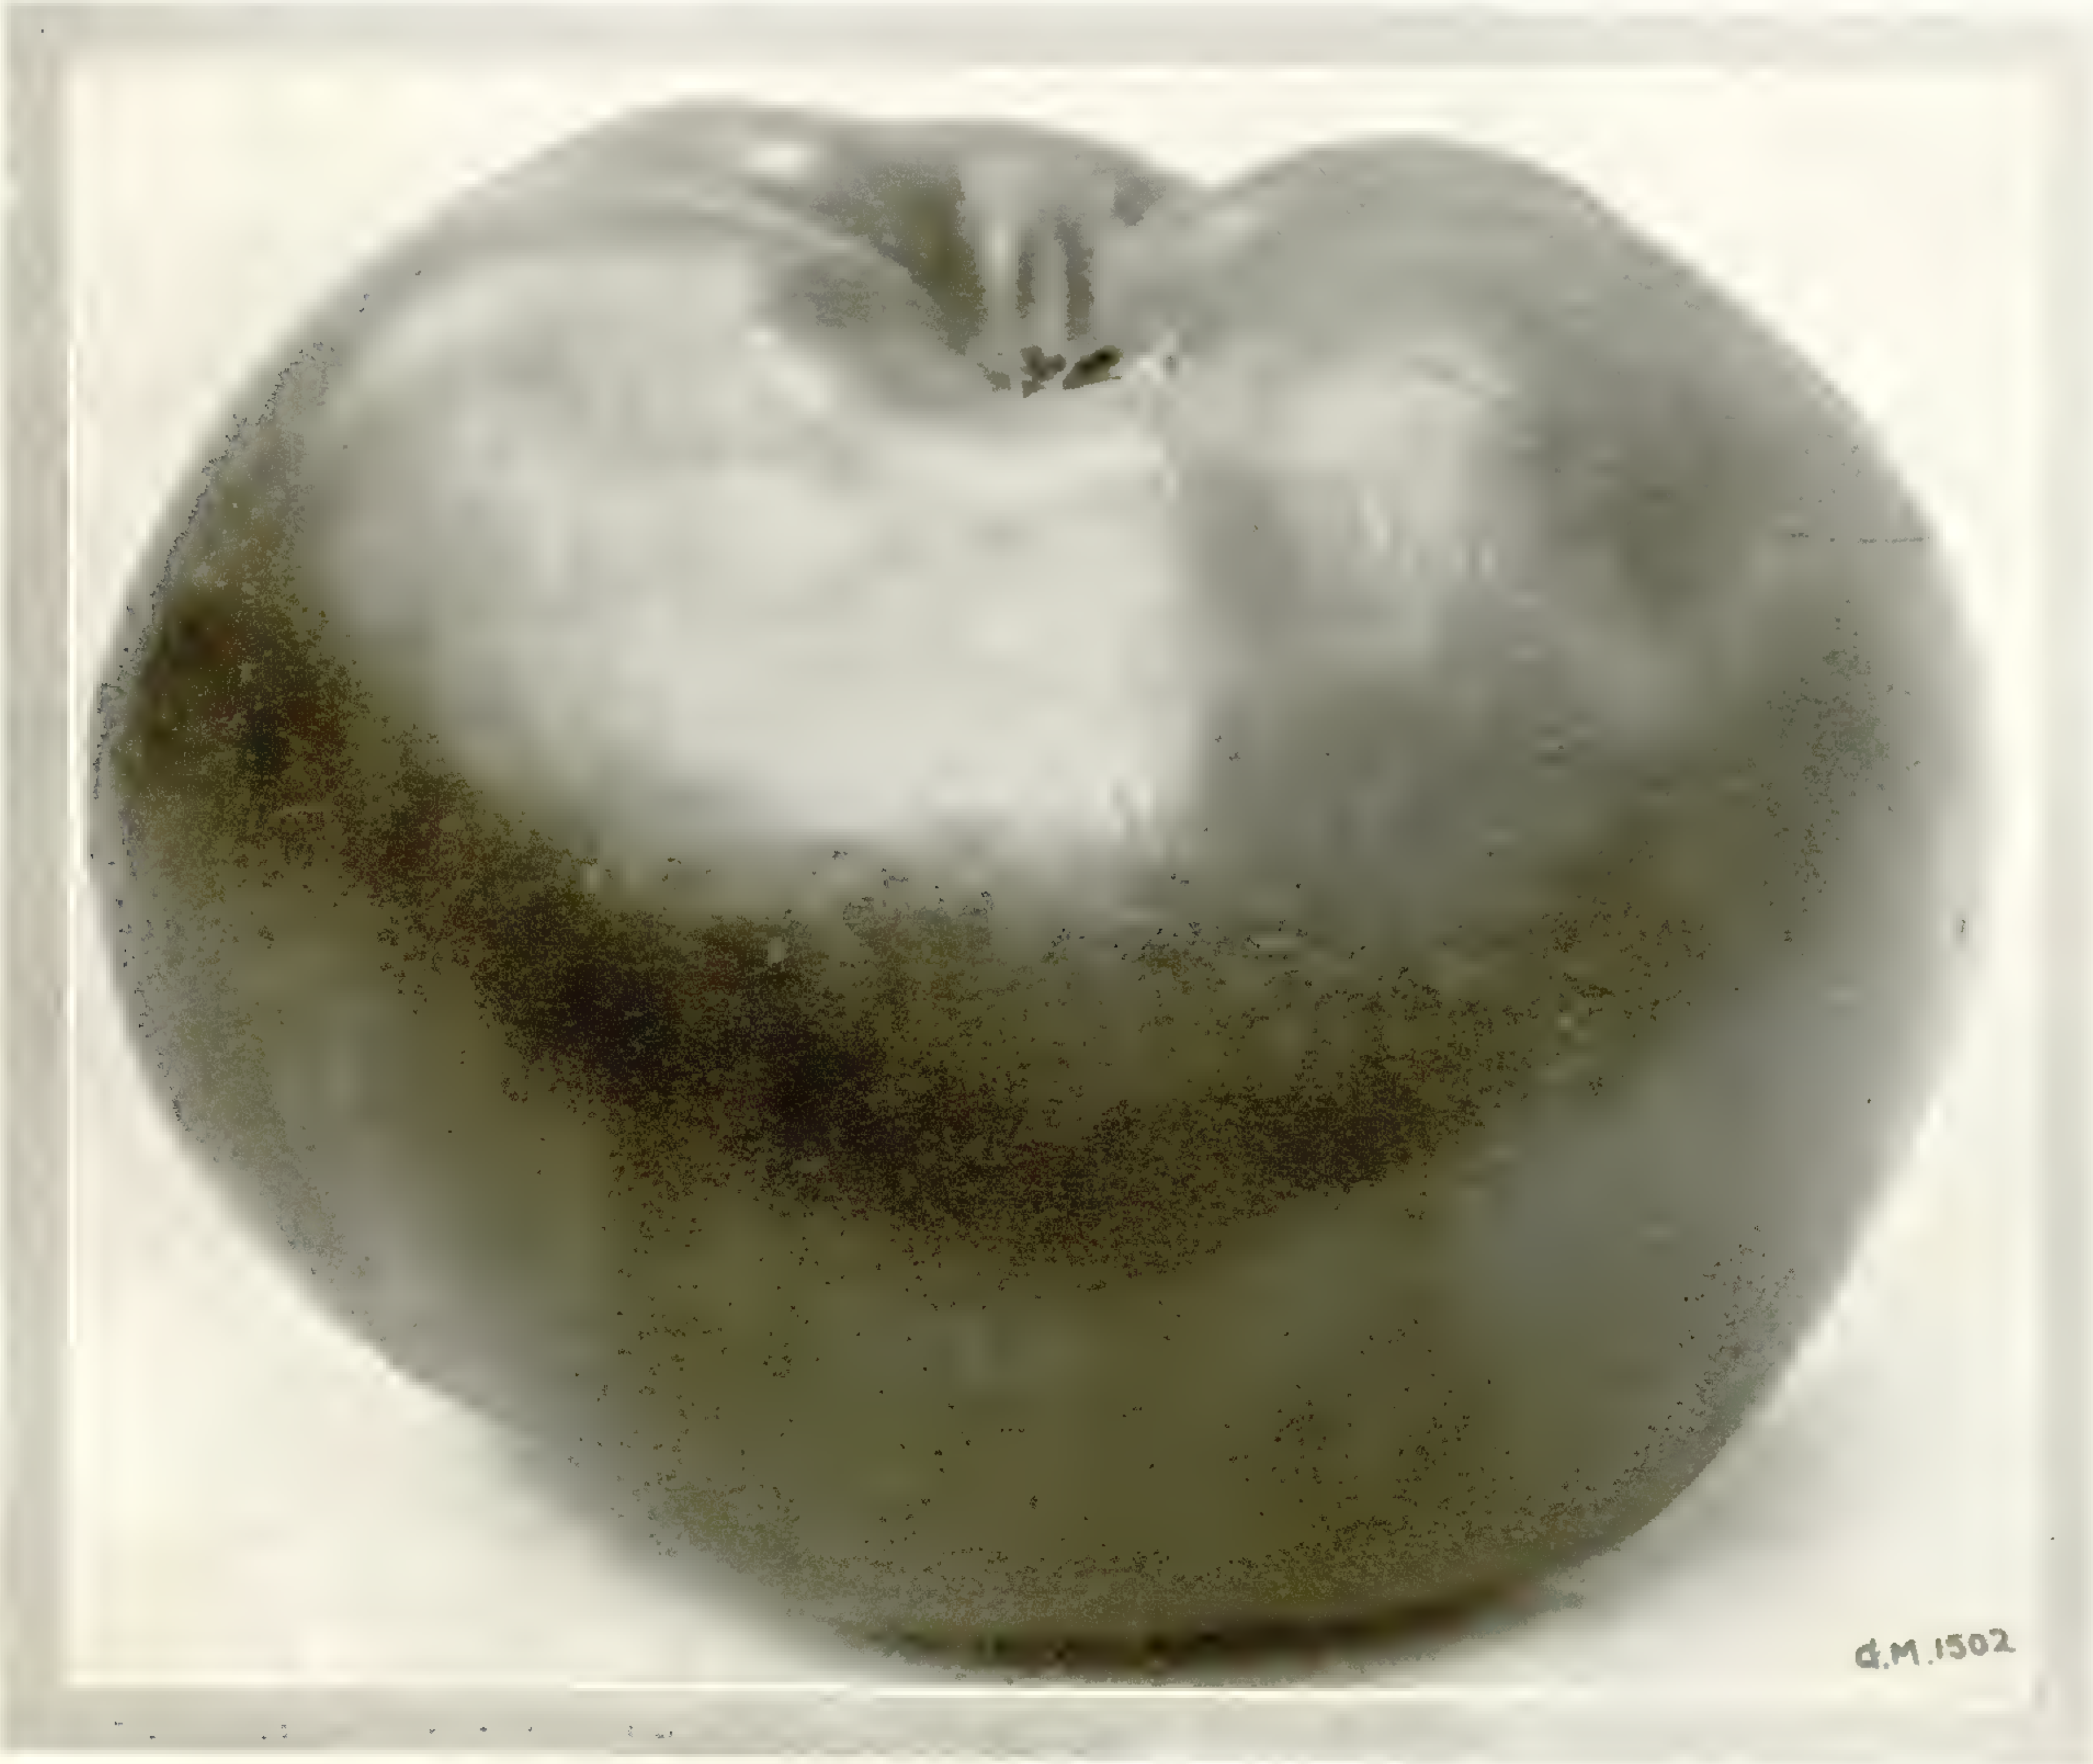
A fine winter-flowering zonal variety with crimson-scarlet flowers; exhibited by Mr. W. H. Page, Tangley Nurseries, Hampton.

Aster Finchley White.—As with all classes of popular plants, the long lists of Michaelmas daisies are very puzzling to anyone wishing to make a selection therefrom. I should not like to guess how many white-flowered forms are to be met with in different catalogues, but I do know that this is one of the best that has come under my observation. —W. T.

TWO GOOD KITCHEN APPLES

Apple Bramley's Seedling.

Beyond knowing that this apple was sent out by Messrs. Merryweather and Son, of Southwell, we appear to know little of its origin, or the date of its introduction. Whatever may have been its origin, I feel well assured it does not belie the advertisement of it, so well known, as being the finest apple upon earth. I for one believe that assertion. Let us consider its many good qualities. There are few situations in which it will not grow; certainly it is at home in a stiff soil, showing not the slightest sign of canker. As a standard it revels in its natural habit of growth, a semi-horizontal form of branch, requires no pruning as a standard, beyond the keeping of the branches thin. Very often the stems are crooked, which seems to be a point in favour as a standard in a wind-exposed site, at any rate in this form the wind does not appear to affect the trees so much. The only fault I find with Bramley's Seedling is that when worked on the free, or seedling, stock it is rather long in coming into bearing, as it grows so vigorously. On the paradise stock no doubt it would be more amenable, and be better suited for a small garden. Whenever I can I recommend it as a standard. Dr. Hogg says the fruit will keep until January; my experience is that it will, under ordinary conditions, keep till May. As a kitchen apple for midseason or late use it has no superior, and so hardy is its constitution that the fruit is not nearly so liable to be infected by scab as many of the softer skinned varieties.



APPLE BRAMLEY'S SEEDLING.

Lane's Prince Albert.

If but three culinary apples were to be grown in any garden this variety must be one of the trio; it has so many points in its favour to warrant its inclusion in so limited a number, and so few against it. Of the latter I would first speak. Perhaps this apple requires more assistance, from a manurial point of view, than any other variety to maintain its growth in a sufficiently free manner to enable the trees to crop to their fullest extent, especially in soil other than a deep sandy loam, which is no doubt quite in keeping with its natural requirements. Some years ago I carried out some manurial experiments with a bush-grown tree of this apple, applying farmyard manure to the roots carefully during the winter, and supplementing this with a surface dressing of Thomson's vine manure directly the fruit was taking its first swelling. The tree grew freely, was quite healthy, gave an annual crop of fruit which grew to a large size, in spite of the heavy crop, which had been thinned judiciously. For field culture this apple succeeds well as a half-standard. This form of training suiting its natural semi-drooping style of growth. As a bush, at times, where growth is not vigorous at the commencement, the branches are liable to be too near the ground. Of course, this fault is aggravated by the heavy crops of fruit the trees bear. A severe thinning of the fruit is a good plan while the trees are young, to encourage more vigorous growth until the foundation of the bush is laid.

For the small grower this apple should be always included, and the trees treated liberally to manure, even at planting time. When once established, either as a bush or as a standard, this variety requires perhaps less pruning than any other owing to the scarcity of new shoots made, when cropping is regular, as it will be when there are apples at all in the neighbourhood. As a culinary apple, from October to the end of March, it contains all the good points required, and for dessert there are many worse, although classed as dessert varieties. For instance, Baumann's Red Reinette. Lane's Prince Albert was raised by Messrs. H. Lane and Son, Berkhamsted, and was introduced by them in 1857.

E. Molyneux.

PARSLEY.

This humble but quite indispensable herb is of very great importance, as it is required all the year round. Common as it is, and humble as it may seem, it has certain idiosyncrasies that baffle even the oldest practitioner. Everyone is more or less familiar with parsley "going off," i.e., when in the most exuberant health and vigour the leaves suddenly turn yellow and droop, and the plants look in a very pitiable condition; they do not exactly die, and after a time they make another feeble attempt to grow, but no good result ever follows, as all the leading roots are dead, and only two or three weak roots spring from the collar of the plants near the surface of the ground.

In my younger days it was always considered prudent to make several sowings of parsley in different positions as far apart as possible in a very large garden, so that if one position or soil did not suit another position or soil might do so. I have adhered to that system as far as possible, and have tried in many ways to ensure a supply of nice green parsley all the year round. We always devote several cold frames to parsley culture, and in some we sow seed and for others we dig up roots from outside beds, and plant them thickly, keeping them well covered up in severe weather. In the spring I have found it a good plan to sow a good supply in 3in. pots, and plant them out as early as possible in March, as plants from this sowing are much in advance of those sown in the open in March. It is a good plan to reserve some of the pot plants until April, for if the weather is very frosty sometimes the newly set out plants do not succeed well. Another good sowing should be made in well-prepared soil at midsummer, which plants are fairly strong and are able to stand the rigours of a moderate winter, and thus produce the earliest supply outside the following spring.

Parsley has "gone off" very badly in our district this year. I heard of one gardener who had a good supply, and I sent to ask him if we could have some roots for our frames, and he replied that we could have a cartload. We were contented with a good wheelbarrow load, and were so very much struck with the wonderful healthiness and robust character of the roots that I felt determined to make a note of it, and send the editor a specimen of a root from this oasis in the parsley desert. The particular bed was sown at midsummer, 1909, on entirely unmanured ground on black shale formation, almost belonging to the coal measures, a specimen of which the editor will see enclosed. The interesting fact about the matter is that where the parsley has done so well is an enlargement to an old garden which at present has not been cultivated, and the parsley in the old cultivated garden hard by has "gone off" very badly.

The lesson seems to be that parsley likes fresh ground, and is not over partial to heavy manuring, as the pasture field out of which the new garden ground was taken is poor and barren. W. M.

Cheshire.

[The plant of parsley sent by our contributor formed a dense mass of finely curled leaves measuring two feet across.—Ed.]

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

BY APPOINTMENT. BY APPOINTMENT.

CHEAP OFFER TO CLEAR.

We beg to inform our numerous clients that we have secured a large tract of land adjoining one of our principal Nurseries, and that it is our intention to clear the Stocks off some of our outlying branch Nurseries at a sacrifice.

Everything has been grown with our usual care, and offered in Lots, subject to being unsold; we guarantee the numbers and quality of each Lot offered.

Particulars of above, together with our General Catalogue, will be sent on application.

JAMES SMITH & SONS (Nurserymen to H.M. THE KING), **DARLEY DALE NURSERIES, near MATLOCK.**

Inspection cordially invited. Visitors met by appointment at Darley Dale or Matlock Stations.

GOLD MEDAL ROSES

WILLIAM LOWE'S

BEESTON ROSES

ARE THE BEST.

For all Soils and Situations.
Roses for Exhibition.
Roses for Pergolas.
Standard and Bush Roses.
Roses for Garden Decoration.
Pillar Roses. Climbing Roses for Walls.
Old and New and all the Best Roses.

All are magnificent plants, and the best value for money obtainable.

Also a grand lot of

FRUIT TREES, ORNAMENTAL TREES, SHRUBS, etc.

Intending Planters should come and inspect my stock of HOLLIES and EVERGREEN SHRUBS of all descriptions.

THE QUINCES.

The quinces are represented in gardens by five species, of which the Common Quince (Cydonia vulgaris) and the Japanese Quince (Cydonia japonica) are the most common. All possess qualifications as ornamental flowering trees or shrubs, as the case may be, whilst the fruit is usually attractive, either in appearance or fragrance. The fruit of at least three species can be used to some extent for culinary purposes, either for flavouring with other fruit, or for jelly making, but it does not appear to be employed for these uses to any great extent. The market value of the fruit is hardly worthy of consideration, for it finds its way into commerce in such irregular quantities that there cannot be said to be any regular supply or demand for it. The seeds of the common quince are, however, used in pharmacy.

From a commercial standpoint the common quince obtains its greatest value from the fact of its forming an excellent stock on which to work pears; trees growing on this stock being considerably dwarfer, and coming into full bearing very many years earlier than those which have been worked on a free-growing pear stock. This, and the ornamental qualities, therefore, form the principal assets of the family. The quinces cannot be said to be very fastidious regarding soil, for they thrive in poor and good loam, though, like other plants, their maximum proportions are attained when a generous rooting medium is provided.

In the following notes attention is directed to the various species and their varieties.

C. cathayensis.—This is the least ornamental of the group, and is rarely met with in gardens. It is a Chinese shrub, but is said not to be common in a wild state. A free and vigorous grower, it forms long rambling branches clothed with lanceolate dark green leaves, and armed with spiny, spurry branchlets. The flowers are a couple of inches across, pale pink, or occasionally almost white, and the fruits are large, three to four inches long, and two to three inches wide. The date of its introduction is not known, but it appears to have been in cultivation in a few gardens for many years.

C. japonica, the Japanese quince, is a native of both China and Japan, and is popular all over England as a wall plant. There is, however, no reason why it should be planted against a wall, more especially in the southern counties, for it is perfectly hardy, and forms large bushes in the open. Some years ago a remarkably fine example was to be seen growing in the gardens of Wimbledon House. This was ten to twelve feet high, and quite twenty feet in diameter, and it flowered with remarkable freedom. It grew on a lawn, and as there was plenty of open space about it the specimen formed a beautiful object. The best results are obtained when they are growing in a border where the root run is restricted, or the soil not of very rich quality, as short-spurred growth is then formed, from which flowers are produced, rather than strong flowerless branches. It stands pruning well, and, in fact, has to be hard pruned when grown against a wall to keep it within bounds. The type with deep red flowers one and a-half inches across is most frequently met with, but there are varieties with white, pink, rose, and yellowish flowers. The fruit differs somewhat in shape, for whilst usually oblong, and two to two and a-half inches in length, it is sometimes apple-shaped and rather flat. The rind also exhibits some difference, for, whilst some have a viscid surface, others are quite dry. They are sometimes used for jelly. Good varieties are camelliæfolia, with semi-double pink flowers; cardinalis, with very deep red blooms; candicans, with white flowers; luteo-viridis, with greenish-yellow blossoms; and flore albo, white. The type is occasionally used for hedges.

C. Maulei.—This Japanese species is usually met with between one and a-half and two and a-half feet in height, forming a rather dense, spreading bush. The flowers are brick red, borne with great freedom, and are succeeded by round fruits, which are yellow when ripe, and very fragrant. These fruits may be used for similar purposes to those of the common quince, and are said to be better flavoured than the fruits of other species. There are several varieties, all of which are useful. Alba has yellowish-white flowers, whilst atrosanguinea, Leichtlini, and superba are remarkable for their large rich red blossoms. One of the three is, however, sufficient to obtain.

APPLE LANE'S PRINCE ALBERT.

C. sinensis, the Chinese quince, was originally described by Thorin, from a tree in the Jardin des Plantes, Paris, and he states that it was introduced into England and Holland during the last decade of the eighteenth century. It, however, appears to have been lost sight of for many years, and it and C. cathayensis were mixed up and thought to be one and the same thing until a ripe fruit was found on a tree in the garden of the late Sir T. Hanbury at La Mortola, by Sir W. T. Thiselton-Dyer, and the history of the two plants was then worked out. C. sinensis is rather tender when grown in the open about London, and it really needs the protection of a wall. The leaves are three to four inches long, ovate, and considerably paler in colour than those of the Japanese quince. The flowers are pink, about one and a-half inches in diameter, and are succeeded by fruits, which, when mature, are from five to six inches in length, and deep yellow in colour. These fruits are credited with being of use for preserves, and for mixing with apples for tarts.

C. vulgaris, the common quince, is met with in gardens and orchards in many parts of the country. About its origin a great deal of uncertainty prevails, but it has been suggested that it was probably found wild in the Caucasian provinces, Persia, and Asia Minor. It has, however, been cultivated from time immemorial, and in old books a number of wonderful tales are ascribed to it, amongst them the one that it was the quince with which Eve tempted Adam. Medicinal properties are ascribed to it, and in Bentley and Trimen's "Medicinal Plants," vol. ii., No. 106, it is stated that "the seeds are used medicinally on account of the mucilage, which possesses emollient and demulcent properties." "In this country it is used externally in the form of a decoction, as a demulcent in skin diseases, affections of the eye, erysipelas, and other cases where mucilaginous applications are useful." The same work adds: "Quince seeds are highly valued by the Mahommedans in India and all over the East as a demulcent tonic and restorative. Europeans have also employed them with success in dysentery. The mucilage of quince seeds is one of the substances used by hairdressers under the name of bandoline, for dressing the hair." Under cultivation the common quince is met with as a tree from fifteen to twenty feet in height. The flowers are pink, or sometimes almost white, and are large and showy. The fruits ripen during the latter end of September and early part of October. Early in their development they are covered with a dense pubescence, but much falls off before they ripen. When ripe they are golden in colour, and very fragrant. On different trees a difference in shape may be noticed, for some trees bear pear-shaped fruits, whilst others more closely resemble an apple in outline. This has resulted in the terms pyriformis and maliformis being applied to the two kinds.

W. D.

NEW PLANTS, ETC.

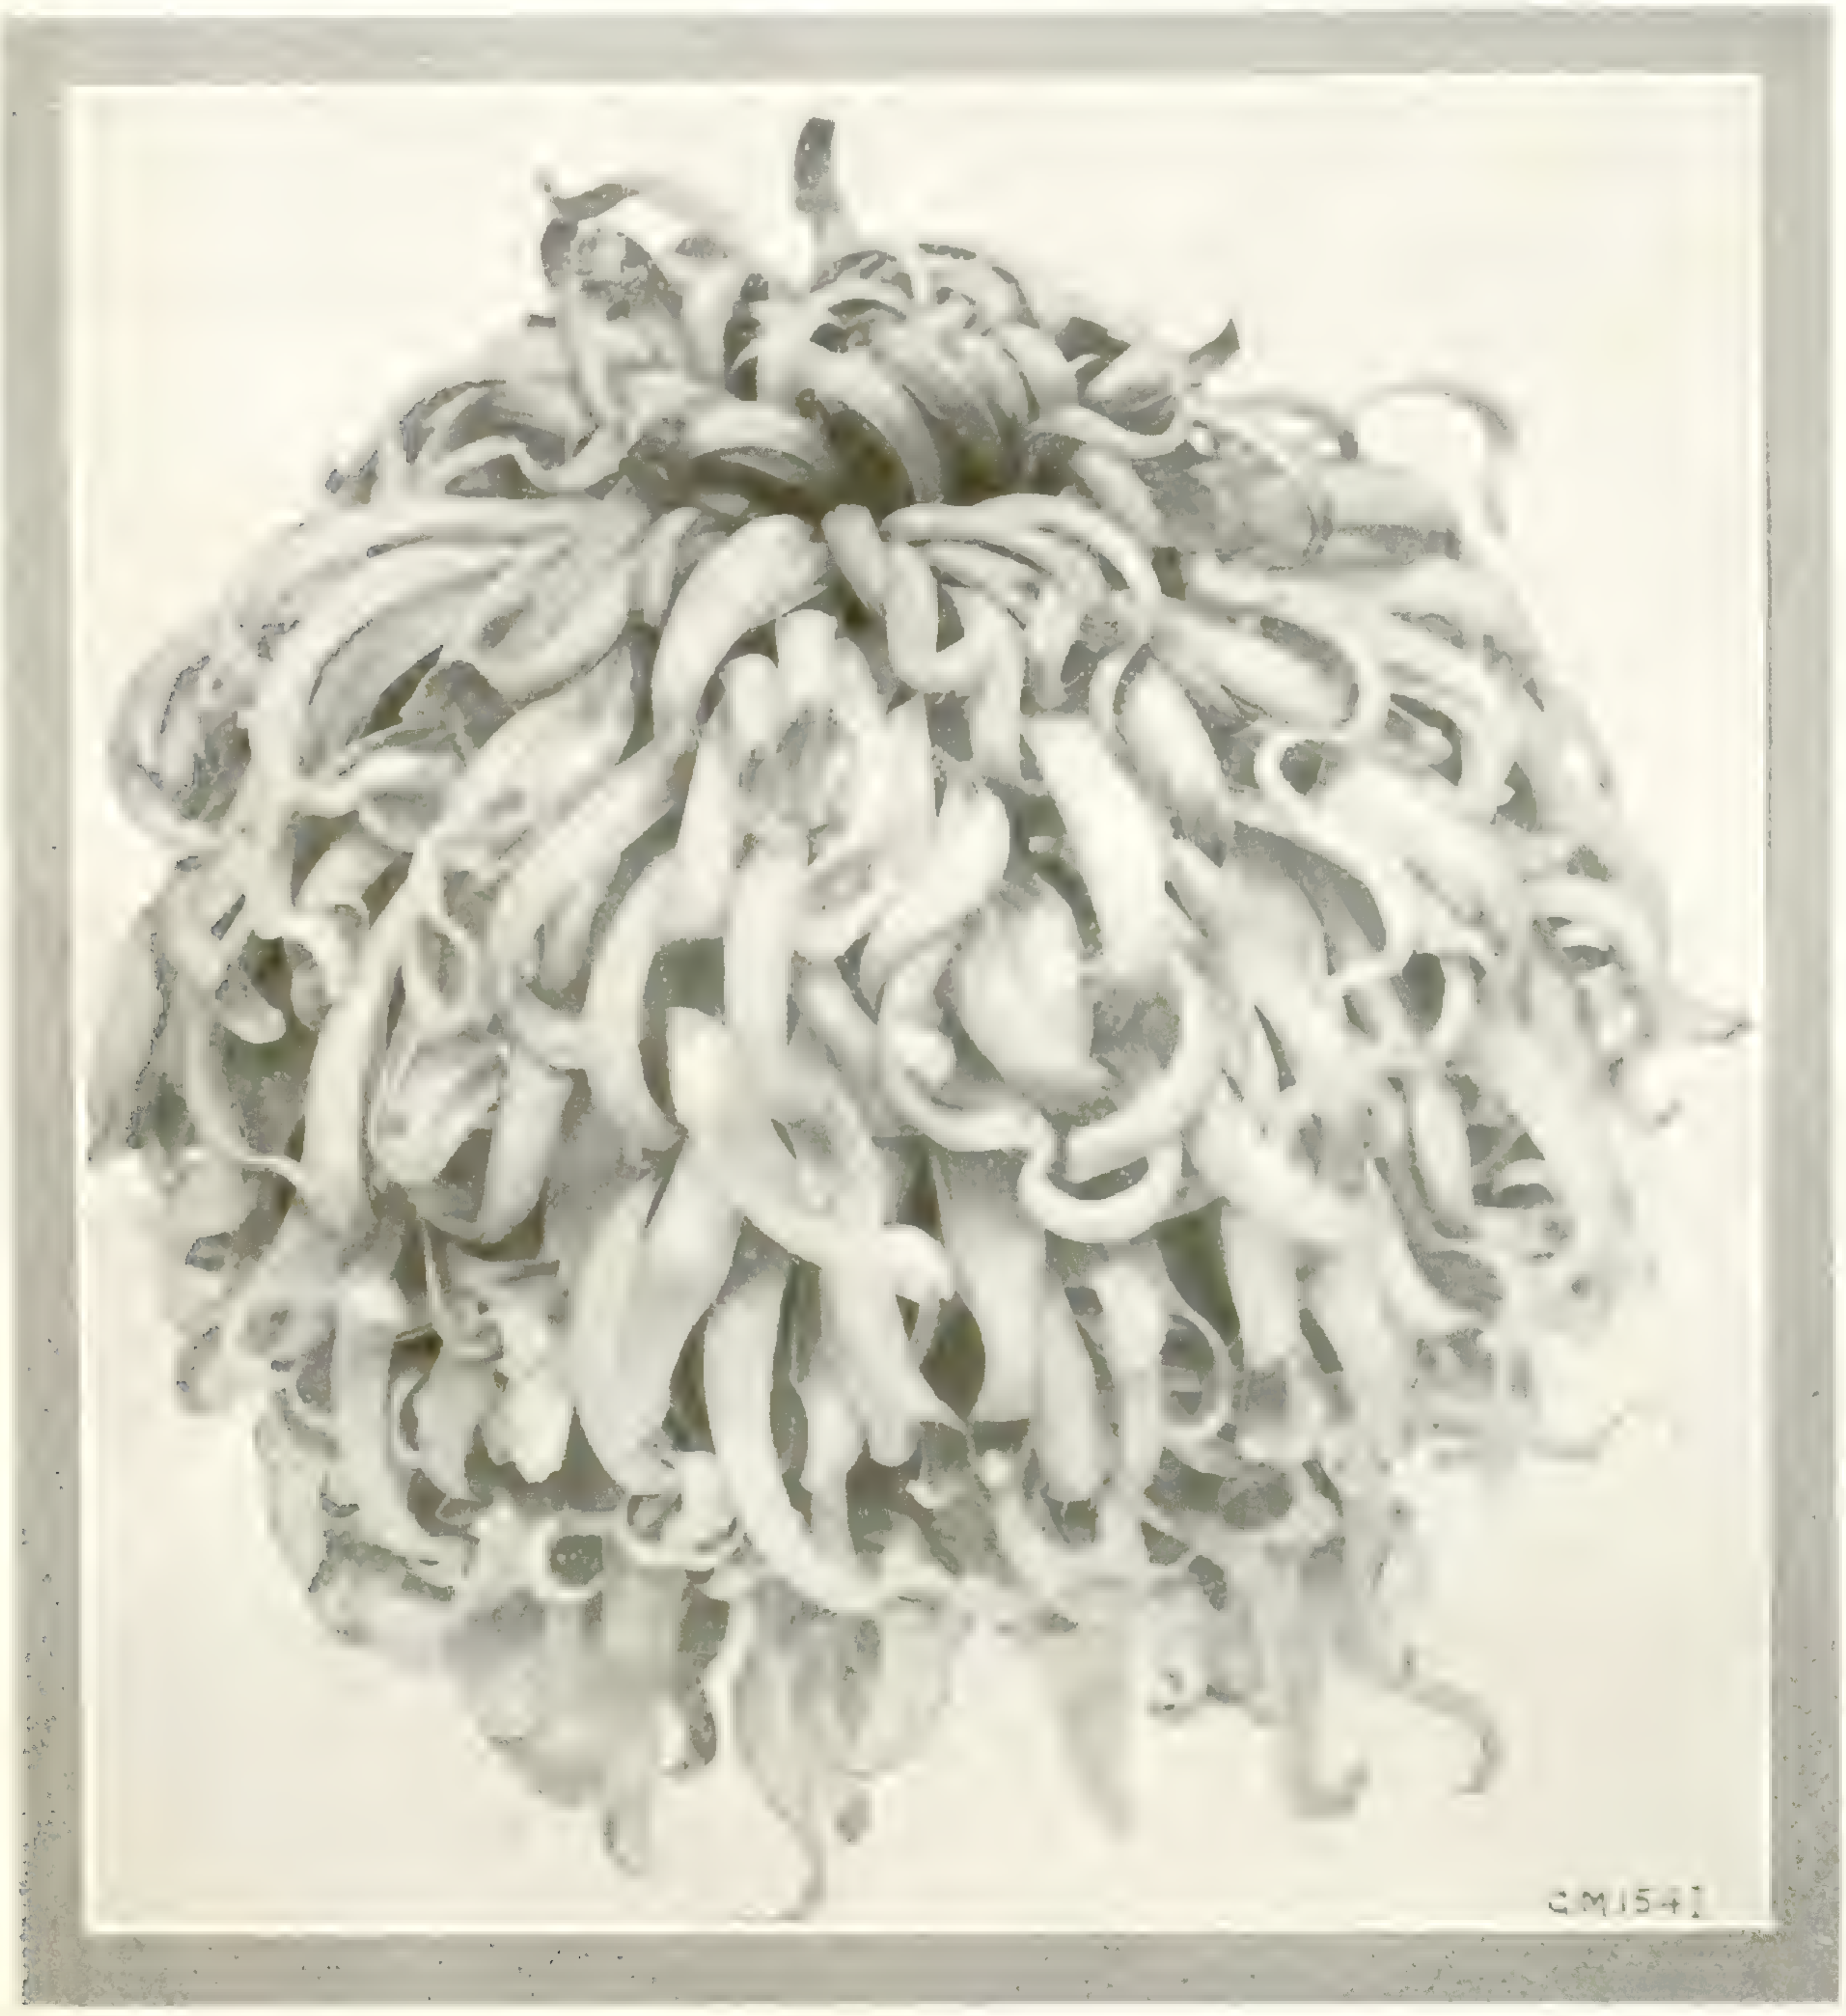
◆

CHRYSANTHEMUMS.

Crimson Jewel.—A very handsome variety with flowers of large size, semi-double, or, say, like a single with about five rows of florets. The rich crimson-chestnut colouring, with tips and margins of gold, is most attractive. F.C.C. (as a semi-double decorative). November 21; A.M., R.H.S., November 22. Messrs. W. Wells and Co., Merstham.

Golden King.—A large incurved variety, a trifle rough, as shown, but evidently capable of being dressed into a striking flower. It makes a full solid bloom, with pointed florets. Commendation, N.C.S., November 21; Messrs. Wells and Co., Merstham.

Sandown Radiance.—A brilliant single of vivid crimson-scarlet colour. It is not quite so even in outline as some of the newer large-flowered sorts, but its size and colour will make it popular. F.C.C., N.C.S., November 21; A.M., R.H.S., November 22. Messrs. W. Wells and Co., Merstham.



CHRYSANTHEMUM D. B. CRANE.
A fine Japanese variety, golden-buff, shaded with chestnut-red. A.M., R.H.S., Nov. 22. Mr. Martin Silsbury, Shanklin, Isle of Wight.

William Turner.—A grand pure white incurved Japanese variety of finest exhibition size. The flowers are very solid, composed of broad curling and incurving florets. F.C.C., N.C.S., November 21; A.M., R.H.S., November 22. Messrs. W. Wells and Co., Merstham.

Colonel E. C. Converse. — A Japanese variety with broad incurving florets, the tips incurving very decidedly. The colour is deep rosy-red, with nankeen reverse. F.C.C., N.C.S., November 21; Messrs. W. Wells and Co., Merstham.

Mrs. W. Powell.—A fine market Japanese variety of a beautiful soft yellow shade. The flowers are of good size and elegant form, the florets drooping prettily. F.C.C., N.C.S., November 21; Mr. H. W. Thorp, Worthing.

Thorp's Beauty.—A splendid deep Japanese variety with moderately broad petals of a bright rosy-red shade with a bright buff reverse. One of the largest of the new exhibition Japanese varieties. F.C.C., N.C.S., November 21; Mr. H. W. Thorp, Worthing.

Phyllis Bryant. — A single variety with rather broad but pointed florets. It bears its flowers freely in good sprays, and is of a pretty soft yellow shade. Commendation, N.C.S., November 21; Mr. Philip Ladds, Swanley Junction.

Mrs. W. Higgs.—A big single variety raised by Mr. W. Higgs. The florets are very broad and regular, and there are two or three rows of them, closely and evenly set. The colour is soft rosy lilac. F.C.C., N.C.S., November 21; Mr. Philip Ladds, Swanley Junction.

Ivy Gay.—A very useful market variety belonging to the incurved section. It is a good grower, and carries solid silvery-pink flowers on good stems. F.C.C., N.C.S., November 21; Mr. Philip Ladds.

Queenie Chandler. — A lovely and refined Japanese variety with very gracefully drooping florets, the lower ones being narrower than the upper ones, and prettily and loosely twisted. The colour is soft primrose-yellow. F.C.C., N.C.S., November 21. Mr. Martin Silsbury, Shanklin, Isle of Wight.

Fred Green.—A grand exhibition Japanese variety with very broad, evenly disposed, drooping florets of a very bright and rich amaranth-purple shade. F.C.C., N.C.S., November 21. Mr. Martin Silsbury, Shanklin, Isle of Wight.

Harry Mann. — A large broad-petalled Japanese variety; the colour is bright chestnut with buff reverse. Commendation, November 21; Mr. G. Mileham, Leatherhead.

Peter Plant.—A large-flowered single, very free, but with rather slender stems. The broad, rich rosy-pink florets recurve slightly. Commendation, N.C.S., November 21; A.M., R.H.S., November 22. Mr. L. Lawrence, Shoreham.

Pink Delight.—A charming single variety of medium size. The flowers are of good shape, and borne freely in elegant sprays. The colour is bright rose-pink, with pale zone round the eye; very effective. F.C.C., N.C.S., November 21; Mr. L. Lawrence, Shoreham.

D. B. Crane.—A splendid Japanese chrysanthemum of fine exhibition size, and yet making a refined bloom. The petals droop gracefully, and are loosely curled; the colour is rich golden-buff, shaded with chestnut-red. A.M., R.H.S., November 22. Mr. Martin Silsbury, Shanklin, Isle of Wight.

Mrs. Foot.—A large reddish-purple single variety, with a white ring round the dull yellow centre. A.M., R.H.S., November 22. Mr. L. Lawrence, Shoreham.

Strawberry.—A beautiful and free-flowering single variety, with the general form and character of the popular Mary Richardson. The colour is bright fawn-red, set off by a bright yellow centre. A.M., R.H.S., November 22. Messrs. G. Williams and Son, Cardiff.

Ernest G. Mocatta.—A beautiful Japanese chrysanthemum, with broad, regular, and gracefully drooping florets that make up a refined flower of good size. The colour is soft yellow, with paler reverse. This variety is a sport from Edith Jamieson. A.M., R.H.S., November 22. Mr. T. Stevenson, Woburn Place Gardens, Addlestone.

Ethel Thorp.—A very large variety that will no doubt have to be classed as an incurved; it will need a good deal of dressing, but in the hands of a skilful grower and exhibitor it will no doubt make a useful addition to the show board. The colour is deep silvery-rose. A.M., R.H.S., November 22. Mr. H. W. Thorp, Worthing.

Brightness.—A large single variety of crimson or rich chestnut-red colour, with a whitish ring round the centre. A.M., R.H.S., November 22. Messrs. G. Williams and Son, Cardiff.

CATTLEYA LUCIDA.

A very free-flowering hybrid from C. Bowringiana and C. Schilleriana. It grows well, and bears its flowers in a closely-set spike. Each flower is of fair size, and of magenta colouring, with a light rosy-mauve edging round the flattish lip. A.M., R.H.S., November 22. Samuel Larkin, Esq. (gardener, Mr. Hale), Haslemere.

CYPRIPEDIUM MINOTAUR.

This is a magnificent hybrid, with a wonderful pedigree. It has a large, rounded, and very broad dorsal sepal, with a small green base, and a median band and some spots of rich red-purple. The petals and lip are green and rich brown. The parentage set out is as follows:

C. Minotaur	C. Minnie	C. nitens	C. villosum C. insigne Maulei
		C. Leeanum	C. insigne C. Spicerianum
	C. Euryades	C. Boxalli	
		C. Leeanum	C. insigne C. Spicerianum

It is interesting to notice that only four distinct species have entered into the composition of the new flower, i.e., C. villosum, C. insigne, C. Spicerianum, and C. Boxalli, the latter coming in as a grandparent. This fine cypripedium was figured on p. 931. F.C.C., R.H.S., November 22. Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

CYPRIPEDIUM IOLANTHE.

A handsome and bold hybrid derived from C. insigne Sanderæ and C. Euryades. The round white dorsal sepal has a green base and some rather large purple spots all over the central area. The petals and lip are green, heavily shaded with bright brown. A.M., R.H.S., November 22. Messrs. James Veitch and Sons, Chelsea.

CYPRIPEDIUM CHARLESWORTHI TEMERAIRE.

A remarkable variety of a now well known species. It differs from the type in having an unusually large dorsal sepal that is wavy, and is bluntly pointed at the apex. The colour of this segment is deep and bright rose, with darker veining. The petals and lip are of the usual greenish-brown colour. F.C.C., R.H.S., November 22. Messrs. Sander and Sons, St. Albans.

VANDA CÆRULEA SANDERÆ.

A remarkable and very distinct variety of the well-known blue-flowered vanda, but instead of the flowers being blue they are light rose coloured, the colour being deepest on the petals, while the lip is dark rose-red. A most novel and striking variation from the type, and probably an unique plant. F.C.C., R.H.S., November 22. Messrs. Sander and Sons, St. Albans.

SOPHRO-CAT.-LÆLIA ALTHÆA.

This handsome orchid is derived from Cattleya Percivaliana and Sophro-lælia Gratrixiæ. The plant is a good grower, and carries flowers of good size. The petals are carmine, flushed with salmon-buff, and the sepals are salmon coloured, while the frilled lip is purple and gold. A.M., R.H.S., November 22. H. S. Goodson, Esq. (gardener, Mr. Day), Fairlawn, Putney.

RHODODENDRON UNGERNI.

This species comes from the Southern Caucasus, and bears a large corymb, or truss, of campanulate pale rose flowers. Whether the plant is perfectly hardy has not yet been determined, but probably it is. At Kew it flowers but rarely. "Bot. Mag.," t. 8,332.

CHIRITA RUPESTRIS.

An interesting and pretty gesneraceous plant, found by Mr. C. Curtis when exploring the Lankawi Islands. Under cultivation it needs moist tropical conditions, and then becomes a bushy plant 2ft. high, that produces blue yellow-blotched flowers freely during the autumn. It is of annual duration. "Bot. Mag.," t. 8,333.

TRISTELLATEIA AUSTRALIS.

A climbing tropical shrub, with pendulous racemes of yellow flowers with red anthers. The flowers are regular, with five broad-lombed segments, and are about an inch and a-half across. The species is found near the sea coast, along the Malay and Australasia. "Bot. Mag.," t. 8,334.

MICROMELES CALONEURA.

This quite hardy tree promises to become popular in gardens. It is closely related to the thorns, and it bears whitish flowers, each a quarter of an inch across, in many-flowered corymbs, on short twigs, and these, with their purple anthers, are very attractive. The flowers are followed by brownish, white-dotted fruits. The strongly-veined and serrately margined leaves are of rich green colour. "Bot. Mag.," t. 8,335.

ALECTORURUS YEDOENSIS.

This graceful liliaceous plant is a member of the asphodel group, and a native of Japan. The plant is a hardy perennial, with long narrow leaves and a tall branching spike a yard or so high. The rosy flowers are more or less pendant along the branches of the inflorescence, and they are dimorphic, some plants bearing short-staminate and others long-staminate blossoms. July is the flowering season, but it does not appear to flower freely. "Bot. Mag.," t. 8,336.

Jasminum grandiflorum. — A deliciously fragrant jasmine, and a most desirable greenhouse climber is this Himalayan species. It is not much grown in this country, though it is often met with on the Continent, and in the warmer parts of Italy and Spain it is largely grown for the sake of the scent obtained from the flowers. Treated as a greenhouse climber it will flower throughout the latter part of the summer and well on into the autumn. Its nearest affinity is with the common hardy jasmine (J. officinale), but it is of a more straggling style of growth, while the flowers are considerably larger, and have a reddish tinge on the exterior. As a roof plant it does not keep much light from the subjects underneath.—W. T.

HARDY PLANT CHAT.

Adonis amurensis.

Owners of slug-infested gardens are cautioned lest they forget that the Amoor adonis is liable to attack from these pests, and that some precaution is desirable if they are to retain their plants of this lovely flower, which gains immensely, in our estimation, from the fact that it blooms very early in the season, sometimes in February. I question, however, if the slug is the sole cause of the losses which occur among plants of this beautiful early adonis. Our winters are so full of changes that a plant which, from what we know of its native regions, is dormant in winter, and then comes on quickly when the weather gives it a settled spring, cannot but suffer from the premature hurrying into growth we frequently have in our winters, followed by keen frosts unaccompanied by snow. It is impossible for us to give this adonis any other conditions in our climate, but we may do something to keep it back, and thus prevent it from being so liable to injury. Planting in shade retards it, and, therefore, gives it less chance of suffering. We naturally wish to have A. amurensis as early as possible, but by putting it in sun we render it more liable to injury by the sun striking upon it when covered with white frost. But slugs ought to be guarded against, and nothing equals the old precaution of a ring about the plant, although one of fine brass gauze is even more effectual than a zinc one. If the latter is notched along the edges it is a great barrier to the vaulting ambitions of the gastropod.

Primula pulverulenta.

To admirers of the Japanese primrose (Primula japonica) it seemed, a while ago, as if nothing of the same class could rival that fine plant. But the advent of P. pulverulenta has shaken this conviction, and when we secure varieties of pulverulenta with the same shades of colour as in P. japonica we shall probably find the latter largely superseded by its more imposing relative. Taller, and more effective because of this, P. pulverulenta is very handsome, with its farina-covered stems and leaves, and its noble spikes of whorled flowers of crimson with golden centres. Like P. japonica, it prefers moisture, and a plant put by way of experiment into a dry border, has failed to do credit to the species, and has looked unhappy, compared with others in moist borders and corners. Where a dry place is the only one available, shade, or partial shade, will be beneficial, but in moisture the flowers are brilliant when in full sunshine. For planting by a

CHRYSANTHEMUM SANDOWN RADIANCE.

A handsome single variety with elegant crimson-scarlet flowers. F.C.C., N.C.S., Nov. 21. A.M., R.H.S., Nov. 22. Messrs. W. Wells and Co., Merstham.

rivulet or a little pond this primrose is grand indeed.

Œnothera Michael Cuthbertson.

This is sometimes catalogued as W. Cuthbertson, but it was first named M., or Michael, Cuthbertson, for an all-sufficient reason. This is that it was raised and distributed by Mr. Michael Cuthbertson, of Rothesay, and my friend, Mr. W. Cuthbertson, who is entitled to all honour for his great work among flowers, would be the first to acknowledge that "Honour should be given to whom honour is due." It is a semi-double variety, but is much superior to the old Œ. Youngi plena, being more vigorous, and also a much prettier colour. It takes after the style of Œ. fruticosa Fraseri, and gives in summer a supply of golden-yellow flowers, almost double, with crimson buds, and the appearance of the plant when in bloom, with open flowers of gold and buds of crimson, is very pretty indeed. The foliage is bronze in autumn, and this border plant, about two feet high, is thus an acquisition to the garden.

Orchis foliosa.

Why is this fine plant so expensive after being so long in cultivation? This is a question which occurs to us, as we see good clumps in some gardens, and apparently there this leafy orchis from Madeira increases in a satisfactory manner. But in other gardens we find that it is less free, and that there a single plant may remain without affording any offsets for years. It would be an assistance to many could we arrive at the precise cause of this discrepancy between the experiences of cultivators of this fine plant, which is the best of the orchises. It does not appear to be a question of moisture alone, as I know of gardens in which it increases well, but where there is no special supply of moisture even better than in some where it is in moister places. So far as my observation goes, it likes a good and well-manured loam better than the peaty soil we are apt to associate with the orchises. I am not at present aware of its natural conditions, but even these would hardly help us much, as the rainfall and the temperature of Madeira are vastly different from ours, and these are factors which cannot be ignored in the cultivation of exotic plants. Whether we possess a small plant or a large one, we must all admire this handsome orchis, with its fine broad leaves, and its nice spike of fine purple flowers.

Orobus aurantiacus.

Botanists, in their natural desire for accurate classification, have abolished the name of orobus from their genera, and have divided the plants we knew by that name between the lathyruses and the vicias. In this distribution we find that Orobus aurantiacus, or aurantia, has now to be called Vicia aurantia. Long usage, however, has so sanctioned the name of orobus that most catalogues retain it, and so we find that O. aurantiacus is to be found in the trade lists. This is quite convenient for gardening purposes, and I am therefore retaining it in this note. It is a plant which is frequently described as having "old gold" flowers. This partially describes the colouring, which is also occasionally called "orange." I do not think that anyone can say it is a showy plant, but it is a pretty one, with its pea-like blooms, in June, and its neat foliage. The plant is about eighteen inches high, and thrives in practically any soil.

S. Arnott.

THE LANGPORT NURSERIES.

He would proclaim himself an absolute ignoramus in horticultural matters who confessed that the name of Kelway, of Langport, was new to him, for surely it would be impossible for anyone to spend a single season among horticulturists, professional or amateur, without learning something of the great work that has been accomplished at Langport, and of the many choice delphiniums, pæonies, gladioli, and other good things that have been raised and introduced to gardens by the Messrs. Kelway. The name is, indeed, of world-wide renown, and every gardener knows so well how much richer our gardens are to-day by reason of Kelway introductions that it would be but retailing stale news for us to dwell upon that subject.

A brief account, however, of what we saw on the occasion of a recent visit to the extensive nurseries will, we believe, be of interest to our readers, particularly those—now a goodly number—who live in distant lands, and have no opportunity of visiting the great horticultural establishments of Britain. Langport is a quiet little Somersetshire town, situated about midway between Yeovil and Taunton, and the soil and climate are admirably suited for the cultivation of hardy plants. Until recent years the nurseries might have been described as off the beaten track, beyond the reach of smoke and dirt; but since the advent of the motor-car this paradise of peace has suffered in common with many another, and the roadside hedges that were so fresh and green are now sadly marred by the dust churned up by an almost constant stream of hurrying motor traffic. As one approaches from the direction of the railway station a glimpse of one part of the home nursery reveals something of the treat that is in store, for there are great beds of brilliant flowers and a number of fine ornamental shrubs within sight of the road. The offices face the entrance gate, but stand some distance back from the road, the space on either side of the walk being laid out in an attractive manner.

The great feature of the home nursery is the fine example of a colour-scheme border, which, as everyone knows, Messrs. Kelway have made a special study. This border is of great length, and considerable space is given to flowers of one separate colour, the grouping being so skilfully arranged that there is a continuous succession of flowers in each colour from spring to late autumn, and the blending or contrasting of colours throughout the whole border bears testimony to the work of a true artist as well as a skilled plantsman. One has but to set oneself the task of selecting, say, a series of scarlet-flowered plants that will grow together and maintain an effective display throughout spring, summer, and autumn to realise what a vast amount of care and thought Messrs. Kelway must have bestowed upon their scheme, which runs through the whole gamut of colours from pure white to richest crimson, orange, and blue. They set themselves a high ideal, and have so well achieved their object that a Kelway border, seen at any time from March to October, is a mass of beautifully-mingled colours, bold and striking in effect, furnishing innumerable gems for close inspection, and an abundance of flowers for cutting. One is impressed here, if never before, with the inexhaustible store of beauty and usefulness that is to be found in hardy herbaceous plants.

Passing through the nursery, the walks of which are all cemented, therefore comfortable to walk upon in any weather, one soon discovers that here is a veritable plant factory, where everything really worth having in the way of hardy perennials is produced in thousands. A few things noted in passing were Œnothera speciosum album, Aconitum lycoctonum, Platycodon grandiflorum, Romneya Coulteri, Zauschneria californica, and, indeed, one might compile a huge catalogue of the good things hereabout. A capital phlox, which is a Kelway introduction, is White Lady, growing about 18in. to 2ft., and producing grand trusses of purest white flowers. Astilbe Davidii was carrying plumes of richly-coloured flowers, and near by helianthemums and potentillas were still ablaze with colour. About twenty acres of pæonies are grown, five acres being planted under fruit trees, and it is found that the partial shade not only lengthens the life of the blossoms, but also improves the colours. A field of pyrethrums in their second bloom was very fine, the single variety, James Kelway, being conspicuous among the richest colours. It is hard to beat.

Leaving the home nursery, we had a look in at England's Fields—a big addition to the original ground upon which the firm was started. Here were great breadths of gladioli spawn, young delphiniums, pæonies, and other general stock; and in Barrymoor Fields, near by, were the beds of pæonies which furnish blooms for exhibition, and an enormous quantity of gladioli in full bloom. It would be difficult to name even the cream of the collection, but a few noticed as of special merit were Queen Mary (white), Limburg (pink and white, with a yellow blotch), Beatrice Kelway (bright pink), King of Gladioli (orange-scarlet), and Huish Tower, an enormous cerise flower. Mention must also be made of a new race of hybrids which Messrs. Kelway have produced by crossing G. primulinus with G. gandavensis. Some lovely things have been obtained from these crosses, but they are not yet to be put in commerce. One particularly striking variety was carrying a spike of great length, the flowers being flame colour suffused with golden-yellow. It is a great acquisition. In what goes by the name of the Allotments were still more gladioli, and big breadths of sweet peas for seed, the latter being particularly true stocks.

Still another large nursery is occupied in close proximity to the famous old church of Huish Episcopii. The fine old tower stands in full view, and the surrounding country is exceedingly fine. It is through this nursery that the Great Western Railway cut their way when making the new line for the Plymouth express, and passengers in passing trains get a fine view of the masses of gladioli, pæonies, and delphiniums that bloom in their respective seasons.

Harking back to the home nursery, we had a hurried peep into the glass houses. Some forty-five houses, of an average length of 50ft., were occupied by such things as begonias, calceolarias, cinerarias, and primulas for seed, tomatoes, cucumbers, and melons being largely grown for the same purpose. There are two great seed stores, four-storied buildings of very large capacity, an inspection of which suffices to convince one that Messrs. Kelway's seed business is even greater and more important than their nursery business. Near by the seed stores stands the gladioli and bulb store, another building of substantial proportions, where the great quantities of bulbs are cleaned, stored, and drawn upon to supply the great demand from this and foreign countries. The nursery staff, independent of the staff employed on the seed farms, numbers well over a hundred hands, and one noticed how smoothly and methodically the whole work of this busy place was progressing. There were labour-saving appliances of various kinds in evidence, as it is imperative in a place of this kind that there shall be no waste of valuable time and labour. The water supply is maintained by the aid of a lofty windmill, and most of the propagation is carried on by the aid of about two thousand pyramidal handlights. Everywhere it was apparent that here is a vast, well-organised business that is of immense importance to the immediate neighbourhood, as well as to British horticulture.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

"CROWN-GALL" DISEASE IN ENGLAND.

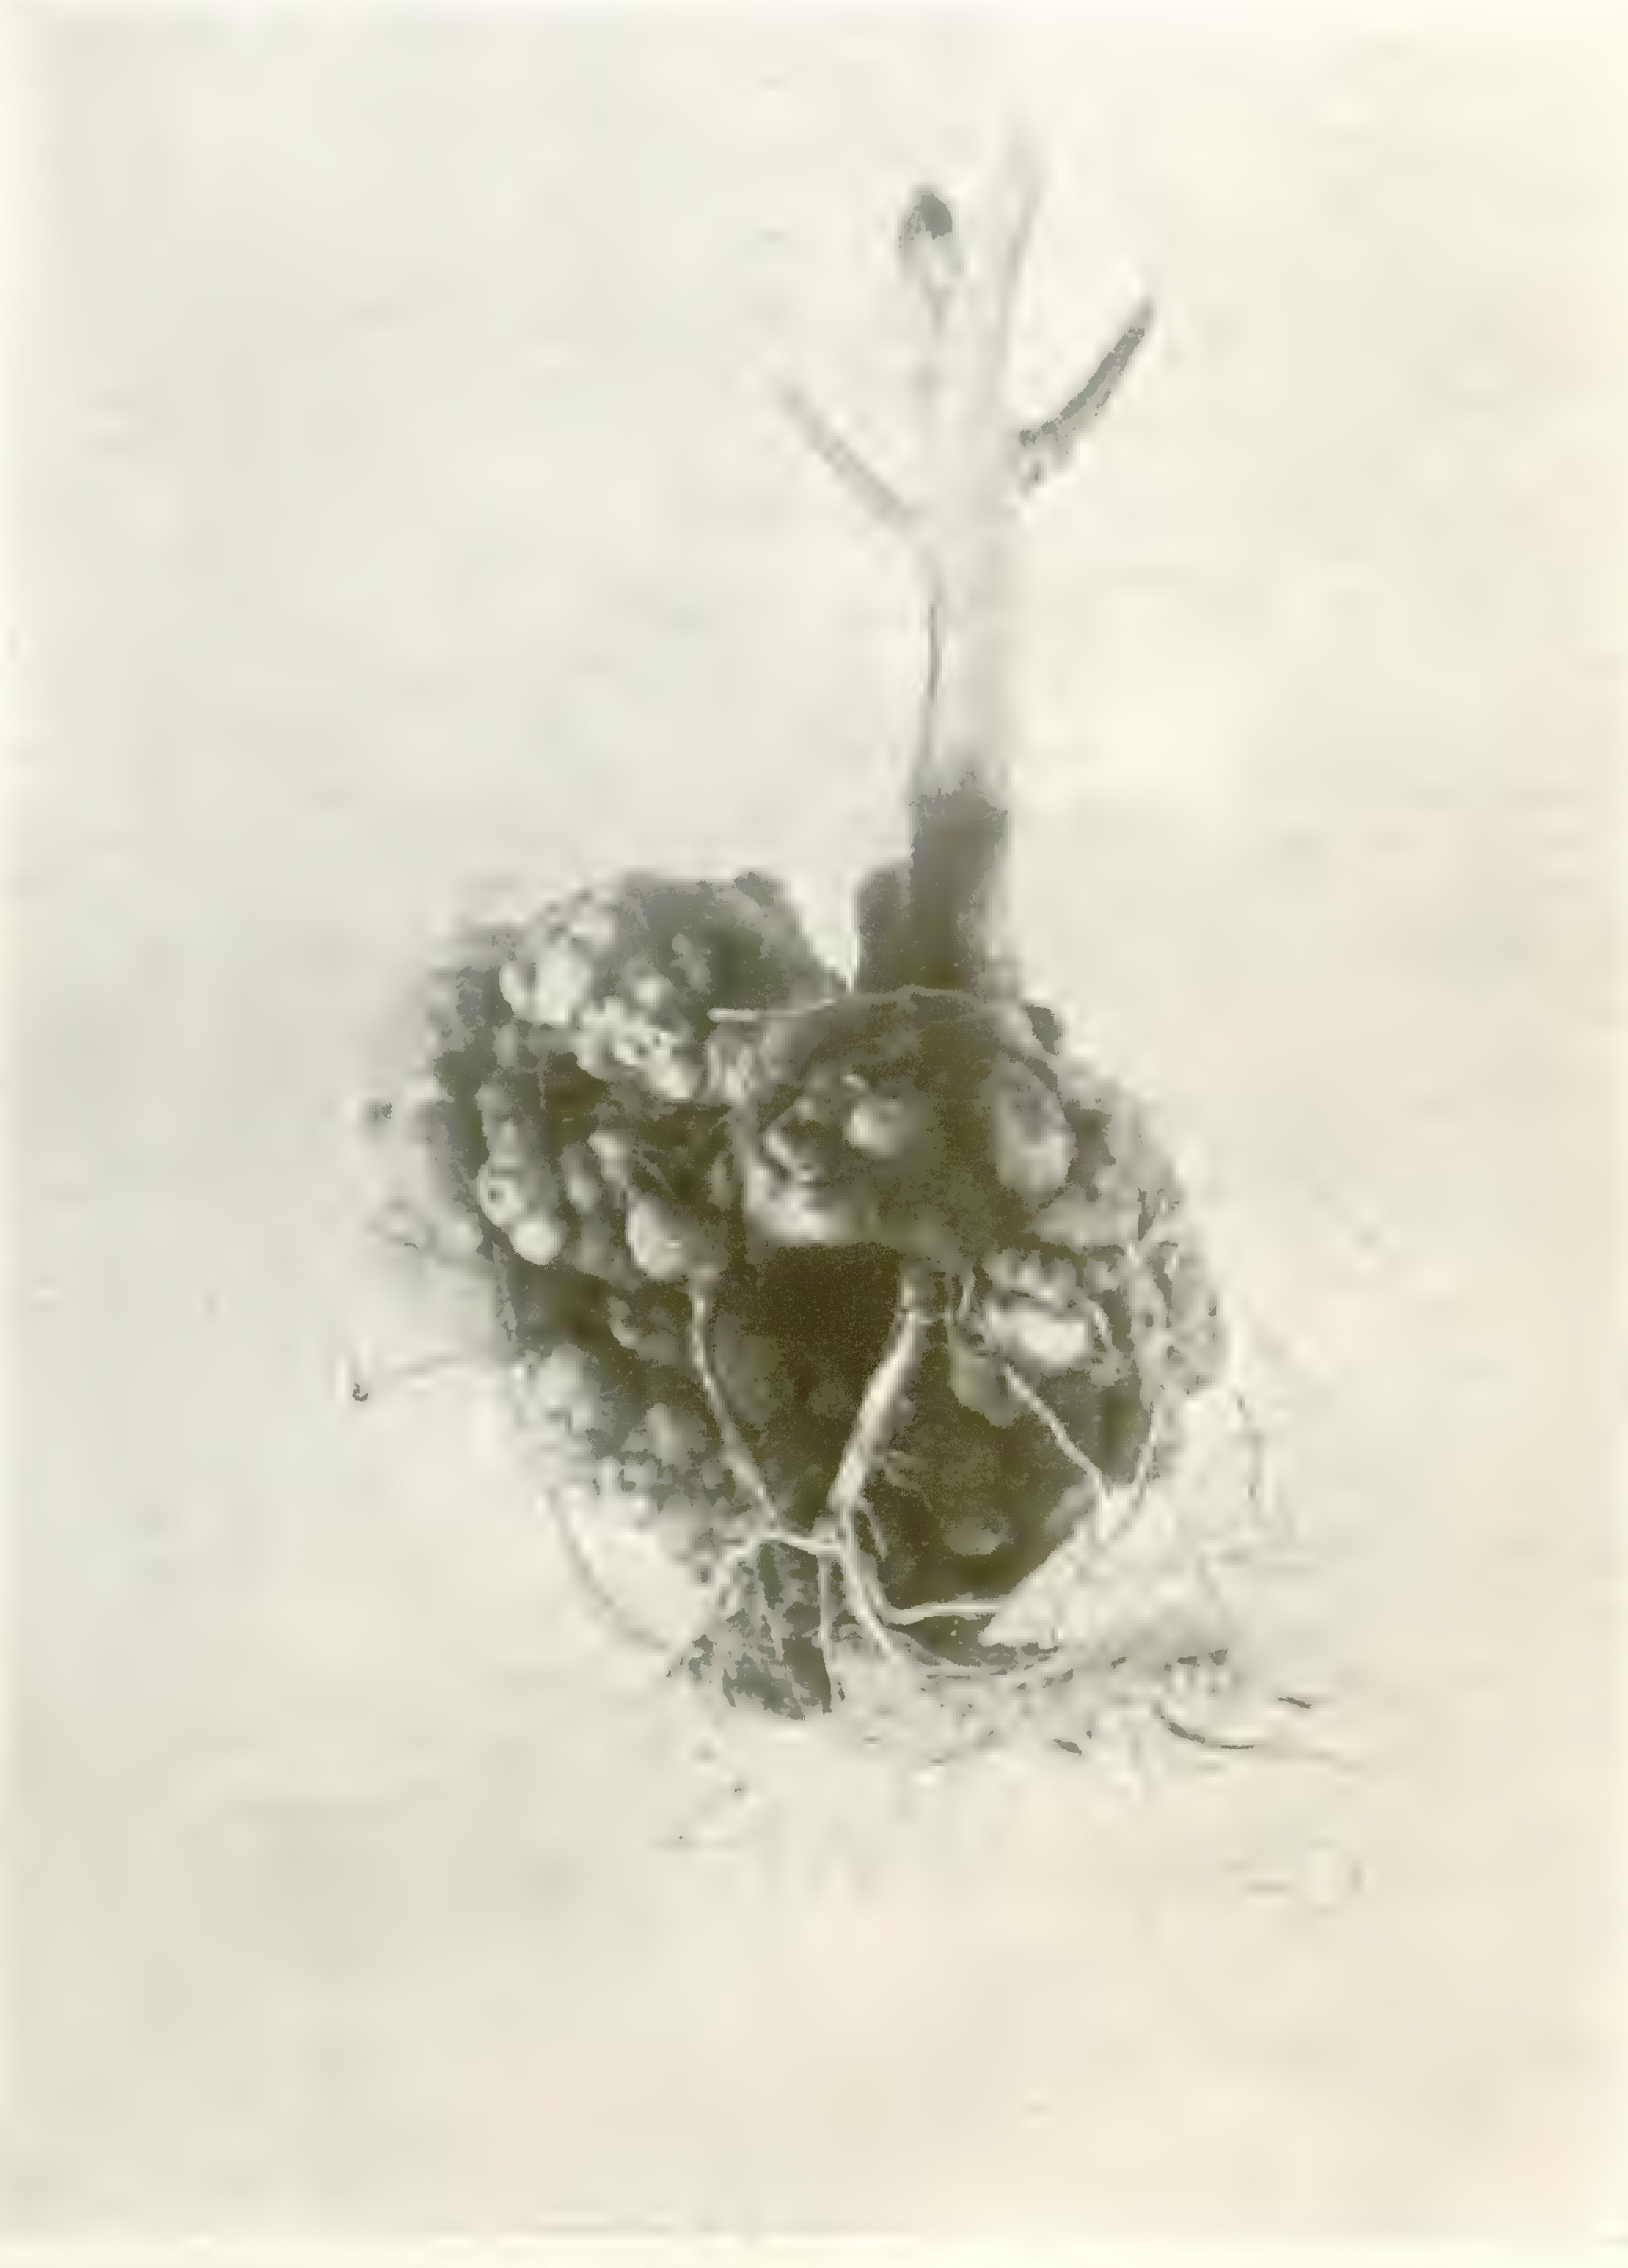
During the present season, examples of plum, rose, raspberry, and chrysanthemum plants have been received at Kew for investigation, each bearing irregularly globose, nodulose galls or swellings originating from the crown or collar region of the stem. The galls varied in size from a pea to that of a cricket ball, and one gall at the base of a rose stem measured seven inches in diameter. Small galls were in some examples also present on the branches of the root. Most of the galls were in an exolete or woody condition, and gave no indication of the true cause of their formation. Mycelium was present in some instances in the dead tissues, and various conidial conditions of fungi were not uncommon in the crannies present on the surface, but nothing of a nature that suggested, from analogy, an organism capable of inducing the formation of a gall.

It was not until a batch of Chrysanthemum frutescens, L., having the base of the stems covered with large excrescences, was examined, that the true nature of the gall was discovered. This proved to be the well-known and very destructive disease called "crown-gall" in the United States. The galls are caused by Dendrophagus globosus, Toumey, one of the Myxogastres, allied to Plasmodiophora brassicæ, Woronin, the cause of "finger-and-toe" or "anbury" on the roots of many cruciferous plants. When a section of a gall in active growth is examined under the microscope, strands of plasmodium are seen permeating the tissues of the gall in every direction. Eventually the plasmodium concentrates in the peripheral cells forming the gall, and from thence passes on to its free surface, where numerous minute, globose, yellow sporangia or fruit-bodies are formed. If a gall containing the organism in an active, or swarming condition is allowed to dry, the plasmodium concentrates into compact masses, and passes into a resting condition. On the application of moisture these resting massses of plasmodium gradually expand and assume an active condition, moving from cell to cell through the wall-pits, and consuming the contents of the cells. "Crown-gall" is considered as a very serious disease in the United States. Hundreds of thousands of fruit trees have been killed by it when growing in the best soil, and with the best treatment. The subject has been very carefully worked out by Toumey who describes the galls as occurring on the following trees: Peach, apricot, almond, prune, plum, apple, pear, English walnut and grape, cherry, poplar, chestnut, raspberry, and blackberry.

Seedlings from one to six months old are most susceptible to the disease. The galls appear in the region of the collar or on the larger roots. A gall commences growth as a very minute, smooth, colourless, wart-like body, often attached to the stem or root by a narrow neck. Growth is rapid, and the surface of the gall becomes nodulose or warted, and darkens in colour. The galls usually decay at the end of one season's growth, and leave an open wound which extends for some distance into the wood. The following spring gall formation commences round the margin of the wound formed the previous season. These galls perish in turn, and the process is repeated each season, resulting in a large, deep wound. When two or three galls are produced on different sides of the stem, it becomes so weakened that the tree breaks off at the injured joint.

Toumey has proved that the disease is of a contagious nature. Healthy seedlings planted in soil mixed with sliced galls contracted the disease, as did also healthy trees planted in proximity to diseased ones.

Since the investigations of Toumey were published, Messrs. Erwin F. Smith and E. V. Townsend have devoted a considerable amount of attention to the origin and cause of "crown-gall," and have come to the conclusion that the primary cause of these outgrowths is a Bacterium, B. tumefaciens, a species not previously described, and that Toumey's Myxogaster is but a secondary agent. It seems quite certain that the galls investigated by Toumey and by Smith and Townsend are identical in origin. It is also quite certain that the "crown-galls" met with in England exhibit the Dendrophagus described by Toumey, and that in these no trace has yet been met with of B. tumefaciens, as described by Smith and Townsend in Centralbl. f. Bakt. Parasit. u. Infektionskr., xx., p. 89 (1907).



"CROWN-GALL" DISEASE IN ROSES.
(By permission of the Controller of His Majesty's Stationery Office.)

From the economic standpoint, however, this variation in the experience of different workers does not materially affect the problem. It is not open to dispute that "crown-gall" is caused by the presence of a living organism. It is therefore possible to formulate definite preventive measures. Further, it is admitted by all who have investigated the subject that the affection, whatever its precise cause, is contagious. Nurserymen and fruit growers will on this account doubtless be glad to adopt such measures as are required to prevent the wholesale dispersion of the disease.

The diseases "crown gall" is probably not new to this country, nor to other European countries, as descriptions of galls corresponding in appearance and position on the host-plant with "crown-gall" are described in works on plant pathology. Sorauer, who made some observations on such galls in Germany, noticed that they were much more frequent in some nurseries than in others, which indicated a parasitic origin, but not succeeding in finding the parasite, he considered such galls as probably the result of mechanical injury or some physiological disturbance. We have at present no knowledge of the relative frequency of "crown-gall" in this country. The galls are formed just underground, and thus escape observation, and those galls that have been observed from time to time have had their origin attributed to other than the true cause, and have not been considered as the symptom of a dangerous disease.

"Crown-gall" is most destructive to nursery stock, as the disease spreads rapidly along the rows, killing a large number of the seedlings outright. The widespread dissemination of the disease in the United States is attributed to the wholesale distribution of infected stock from nurseries, also to the carelessness of orchardists in not dealing promptly with diseased material. In the case of older trees becoming infected, the galls may continue to be produced for many years, the tree living on, but making less growth and producing less fruit, and of an inferior kind to that of a healthy tree. It is estimated that $1,000,000, possibly much more, are lost annually in the fruit-growing regions of the United States through this disease.

When trees are not badly diseased, Toumey found that by removing the galls and covering the wounds made with a paste composed of one part of sulphate of iron, two parts of sulphate of copper, and three parts of quick lime, the further development of the gall was frequently arrested. On the other hand, the most economical course is to remove and burn trees that are at all badly diseased, as they not only constitute centres of infection, from which the disease spreads rapidly through the soil to adjacent trees, but such trees, though they may continue to live for years, never produce a crop equal in either quantity or quality to that produced by a healthy tree.

Quick-lime should be worked into the soil in orchards known to be infected. Finally, nursery stock should be examined critically before it is planted.

NATIONAL HORTICULTURAL SOCIETY OF FRANCE.

This famous French Horticultural Society, which occupies in France the same position as the R.H.S. does in England, was founded in 1855. M. Viger, formerly Minister of Agriculture, is the president. It was under the auspices of this society that the recent International Exhibition and Chrysanthemum Congress was held in Paris. Twice a year the society holds, on a splendid site in the Cours-la-Reine, a spring and an autumn exhibition, besides smaller shows for dahlias, roses, gladiolus, etc., at other periods, which take place in the society's hall in the Rue de Grenelle. The big spring and autumn shows are each visited by about 100,000 visitors. On the first Sunday during the recent chrysanthemum show about 35,000 persons passed through the turnstiles. Both these shows are open for ten days, Sundays included. The library of the society, unequalled in Europe, has about 15,000 volumes, most carefully classified, and of which there is an excellent catalogue compiled by the librarian, M. Geo. Gibault, an eminent authority on horticultural literature. Fortnightly meetings are held, at which papers are read on various subjects of interest relating to the practical and scientific phases of gardening. Much of the work is done by sub-committees, there being thirteen in all. The chief of these are the Scientific, Pomological, Kitchen Gardening, Floral, Orchid, Rose, and Chrysanthemum Committees.

Awards are made to gardeners for long and faithful service to their employers, and scholarships are awarded to young gardeners. The annual expenditure in this respect amounts to 30,000 francs. The annual subscription for ordinary members is 20 francs (16s.) per annum, which can be commuted for a lump sum of 250 francs (£10). There are also various other grades of membership, such as life members, honorary members, corresponding members, etc. Altogether the roll numbers at the present moment 4,536 members.

Lilium nepalense.—This, one of the most distinct of lilies, is essentially an autumn flowering kind. Though previously referred to by botanists, it was quite unknown in this country till imported and flowered by Messrs. Low just 22 years ago. It is of rather tall, spare growth, with the lower portion of the stem particularly firm in texture. The drooping flowers are recurved in a very graceful manner, the upper part of the segments being greenish-yellow, and the basal portion deep purple, thus forming, as it were, a purple centre to the flower. This lily is a native of Burmah, and needs greenhouse culture.—W. T.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s 6d., by post 1s. 8d., from W. H. and L Collingridge, 148 and 149, Aldersgate Street, London

FRUIT TREES AND SPRING FROSTS.

(Concluded from page 912.)

Theoretically there are two reasons why quick thawing should cause injury to the plant:

Firstly: In the changing of solid ice into water, heat must be absorbed from somewhere, and some of it obviously should come from the more deeply placed plant cells, so that, cold before, they become even colder then.

Secondly: It is impossible that the cell wall can on the instant suck up the great masses of suddenly formed water from the thawed ice, which means that the water remains in the intercellular spaces, is evaporated into the open air and lost before it can be taken back into the plant cell.

A point to be considered is the temperature at which ice is formed in the plant.

It does not begin at the ordinary freezing point of water, i.e., at a temperature of O°C, but usually at some degree lower. The freezing point of cell sap varies with its composition, but is always below O°C. Muller-Thurgau and others have shown that the sap is cooled down below its freezing point before ice is formed, i.e., a super-cooling or under-cooling occurs. When this occurs the ice forms suddenly, and is accompanied by a rise of temperature.

In the grape, for example, under-cooling took place till a temperature of minus 7 degrees centigrade was reached, and then ice formed and the temperature rose to minus 3 degrees centigrade.

Apples and pears were cooled to—2°C or —5°C before ice formed suddenly at —14°C to —1.9°C.

Experiments carried out by Professor Sarauer on fruit trees show generally that as a result of frosts a browning of the protoplasm takes place. The cell wall was not discoloured, as a rule, and the damage was most apparent in cells with rich, sappy contents.

It is very difficult to avoid confusing damage by frost with damage from other causes. For example, while experimenting with Morello cherries, and before freezing the twig artificially, I opened some apparently healthy buds, and in many cases found that the centres were already turning brown or black. Now this is a symptom almost invariably attributed to frost, but in the case described it could not be due to it, since we had experienced no frost for some time previously. On microscopical examination the tissue proved to be full of fungus threads, and no doubt the blackening was due to the fungus. This shows how easily wrong conclusions may be drawn concerning the matter.

As regards the effect of the wind, one or two points may be mentioned. The shaking of the branches and the quick passage of air promotes loss of water, and creates a tendency for the leaf to dry up, thus we often notice dried up leaves hanging on the branches after a great wind. The same drying up effect is seen, although to a lesser extent, in a browning round the margins of the leaves.

According to Hansen, the wind, like frost in this respect, does not directly cause the leaf to wither, but causes a similar drying up of the protoplasm of the leaf cells. He also describes a similar appearance to that produced by frost. Professor Sorauer, in his "Handbook der Planzen-Krankheiten," mentioned that protection against raw spring winds is often more necessary than against frosts.

He mentioned a case in which young rhubarb leaves were frozen and slowly thawed, only those leaves which had met with the wind were injured. Portions of rose bushes also which were in a protected place were unharmed after a frost, whereas other portions to which the wind had free access were destroyed. The wind may also interfere with the normal distribution of the sap in the plant. It may also do harm by blowing away snow which would otherwise cover up and protect plants in periods of cold.

It is obviously desirable to have an accurate knowledge of all available facts with regard to the action of frost, and the actual changes of temperature that occur, and investigations and collection of information on the following points are being carried on at Wye College.

1.—The changes of temperature that occur in plantations between sunrise and sunset.

2.—The distribution of temperature near the ground and at the height of the blossoms.

3.—The effect of antecedent weather conditions.

4.—The effect of local conditions (shelter, shade, air currents, situation, etc.).

5.—The incidence of frost in variously arranged plantations; such questions, for example, as whether more damage is done in plantations wholly of gooseberries or where these are mixed with plums.

6.—Whether the nature of the ground and methods of cultivation have any effect on hindering frost damage.

7.—The examination, microscopical and otherwise, of the injuries actually done by the frost.

8.—The effect of artificial freezing on blossoms.

In this last connection, I tried the effect of an artificial freezing on forty-five different twigs of four sorts of trees, viz., Morello cherries, damsons, greengages, and apples.

In order, as far as possible, to obtain actual conditions, the freezing was carried on with living twigs actually on the tree. By thus keeping the twig on the tree it is possible to watch its further growth, and to compare it with others which have not been treated.

The part of the twig to be frozen was put into a freezing chamber and surrounded by another vessel containing a mixture of ice and salt.

A sensitive Centigrade thermometer was fixed so that the bulb was in the freezing chamber, and readings were taken every two minutes. The end was covered in so as to inclose the twig as completely as possible, and precautions were taken to prevent the flowers and leaves from touching the cold sides of the freezing chamber.

We have so far tried the effect of (1) varying temperatures for the same interval of time, and of (2) the same temperatures for varying intervals of time.

Short exposures to frost, even if the temperature falls as low as —6°C, seem to have but little effect on apple and damson blossoms; this is in accordance with the general experience that apple and damson blossoms suffer less from frost than, for instance, greengages and cherries.

This is well seen in the following cases:

	Min. Deg. C. below Zero.	No. Time of Freezing in Minutes.	
Apple	8.8	14	Flowers and leaves killed, but dormant buds breaking.
	7.4	14	Flowers all killed, early leaves affected, but shoot quite recovered.
	6.3	40	Flowers all fallen, leafage rather worse than last.
	3.0	66	One fruit set, but retarded. Foliage affected.
Damson	6.3	12	Unaffected.
	6.2	20	All flowers killed and leaf buds received a big check.
	3.9	20	Unaffected.
Cherry	4.0 (in bud)	30	Unaffected
	4.5	10	Killed.
	2.6	10	Many fruits set.
Damson	6.5	11	Unaffected.
Cherry	6.4	10	All blossoms killed.
Apple	6.9.	9	Unaffected.
Cherry	4.5	10	Killed.
Apple	4.9	30	Unaffected.

So far we have dealt only with the formation of ice in the plant, but damage may occur without the formation of ice.

The movement of sap in the plant, the manufacture of plant food, and, in fact, all the functions of a plant depend on a favourable temperature. If the temperature remains low the functions are carried on less energetically just as in the case with the human body in cold weather, and anything that tends to produce and prolong low temperature is harmful for the plant, quite irrespective of the formation of ice.

Each plant has its own specific minimum temperature for growth, which is generally about the freezing point of water, and as we get near to this the plant begins to lose activity, quite apart from whether ice is formed or not.

On a dry, still night the plant loses much heat, so that portions of it, especially thin portions, with a relatively considerable amount of surface, become much cooler than the surrounding air, and may, indeed, be several degrees below freezing point while the air around is some degrees above it. This is a point worthy of notice.

Plants in which the tissues are rich in water are specially susceptible. Thus soft, sappy tissues are easily destroyed by cold.

CHINESE OR BENGAL ROSES.

As several really good additions have been made to this favourite class it may be well to note some of the best while the planting season is still with us.

The old Blush, or common Monthly, variety, was sent out by Parsons as long ago as 1796, and is still difficult to beat as a pale pink; it is too well known to need description here. The old crimson variety appeared in 1810, or exactly one hundred years ago; this also needs no comment. Cramoisie Supèrieure came out twenty-four years later, and favours the Old Crimson in many ways. I think it more double, a little better grower, and I should give it the preference for bedding, thinking it a little better in bloom and growth. Ducher (1869) is the best white: the flowers are perfect, pure white, in large trusses, and the plant is thoroughly perpetual. A very deep crimson, with a faint line of white, named Fabvier, is perhaps the best deep crimson bedder of the older varieties. This was sent out, or raised, by Laffay, who also gave us Mrs. Bosanquet, a pale flesh, of good size for this class, and a very free bloomer. By some this rose is classed as a Bourbon. Eugène Beauharnais (1838) is a very distinct and deep amaranth-red, of good size and substance, and one of the best. This last, with Fellenberg (1857), a semi-double bright crimson, make the best of the older kinds.

We now come to several that have art colours, rather than plain self hues. It was in 1887 that Guillot gave us Laurette Messimy, a beautiful soft and clear rose, shaded with yellow, and quite a break in this class. The same raiser followed this in 1895 with Madame Eugène Resal, a much-improved flower in some ways, being coppery-rose shaded with clear orange. These two are still among the best. In 1903 Guillot seems to have even improved upon these with Comtesse du Cayla; a reddish-carmine, tinted with orange, and very beautiful. This is also a capital grower, and throws its trusses wider than the two previously mentioned. Chin-Chin, from Hobbies, in 1909, is, I believe, a sport from this. Chin-Chin is a clear sulphur-yellow that does not fade or go pale with age—a great fault with many of this colour. It has the same growth, and is a decided acquisition to the class. Arethusa, from William Paul and Son (1903), is also a yellow, but tinged with apricot, and more resembling Queen Mab in habit. Queen Mab was sent out by the same firm in 1896. It is only moderate in growth, but very free flowering, and of beautiful colour, soft rosy-apricot, orange centre, and tinted outside with rose; a very pretty little flower in all of its stages. Another from Waltham Cross is Duke of York (1894); this is a very variable flower, rosy-pink and white, edged and tipped with both colours, and seldom has two blooms just alike. A good sturdy grower, and free. Irene Watt (Guillot, 1896), is a reputed seedling from Laurette Messimy; white, tinted with salmon-pink, very long buds, and free. This, I think, completes the list from that firm, who have given us so many beautiful Chinas.

Hermosa, or Armosa, like Mrs. Bosanquet, is frequently classed both as a China and Bourbon. It much resembles the Old Blush, but is rounder and fuller in the flower, and, I think, closer or more robust in growth. Jean Bach Sisley is a silvery-pink, with the outside of its petals tinged with carmine; a vigorous grower, and very free. In 1899 V. Schwartz gave us a very little flower in Cora, which is a clear yellow, tinted with carmine. Leuchtfluer, sent out by Turke two years ago, is a deep blood-red, that will be grand for massing. Unermudleche, from Lambert, in 1904, is a very rich crimson, with red shadings.

Among the newest varieties we find V. Schwartz sending us two this year (1910). I believe both will prove good and useful. One, Mdlle. de la Vallette, is golden-yellow shaded with coppery-red, with a ruby tinge on the outside petals. The other, Mrs. Edward Clayton, is a coppery golden-yellow, with carmine edges. Both are quite distinct. This list by no means exhausts the true and dwarf-growing Chinas, and there are several hybrids, which I do not propose to touch upon. I may, perhaps, mention that the Green Rose (Viridiflora) is a true China, and was sent out in 1859.

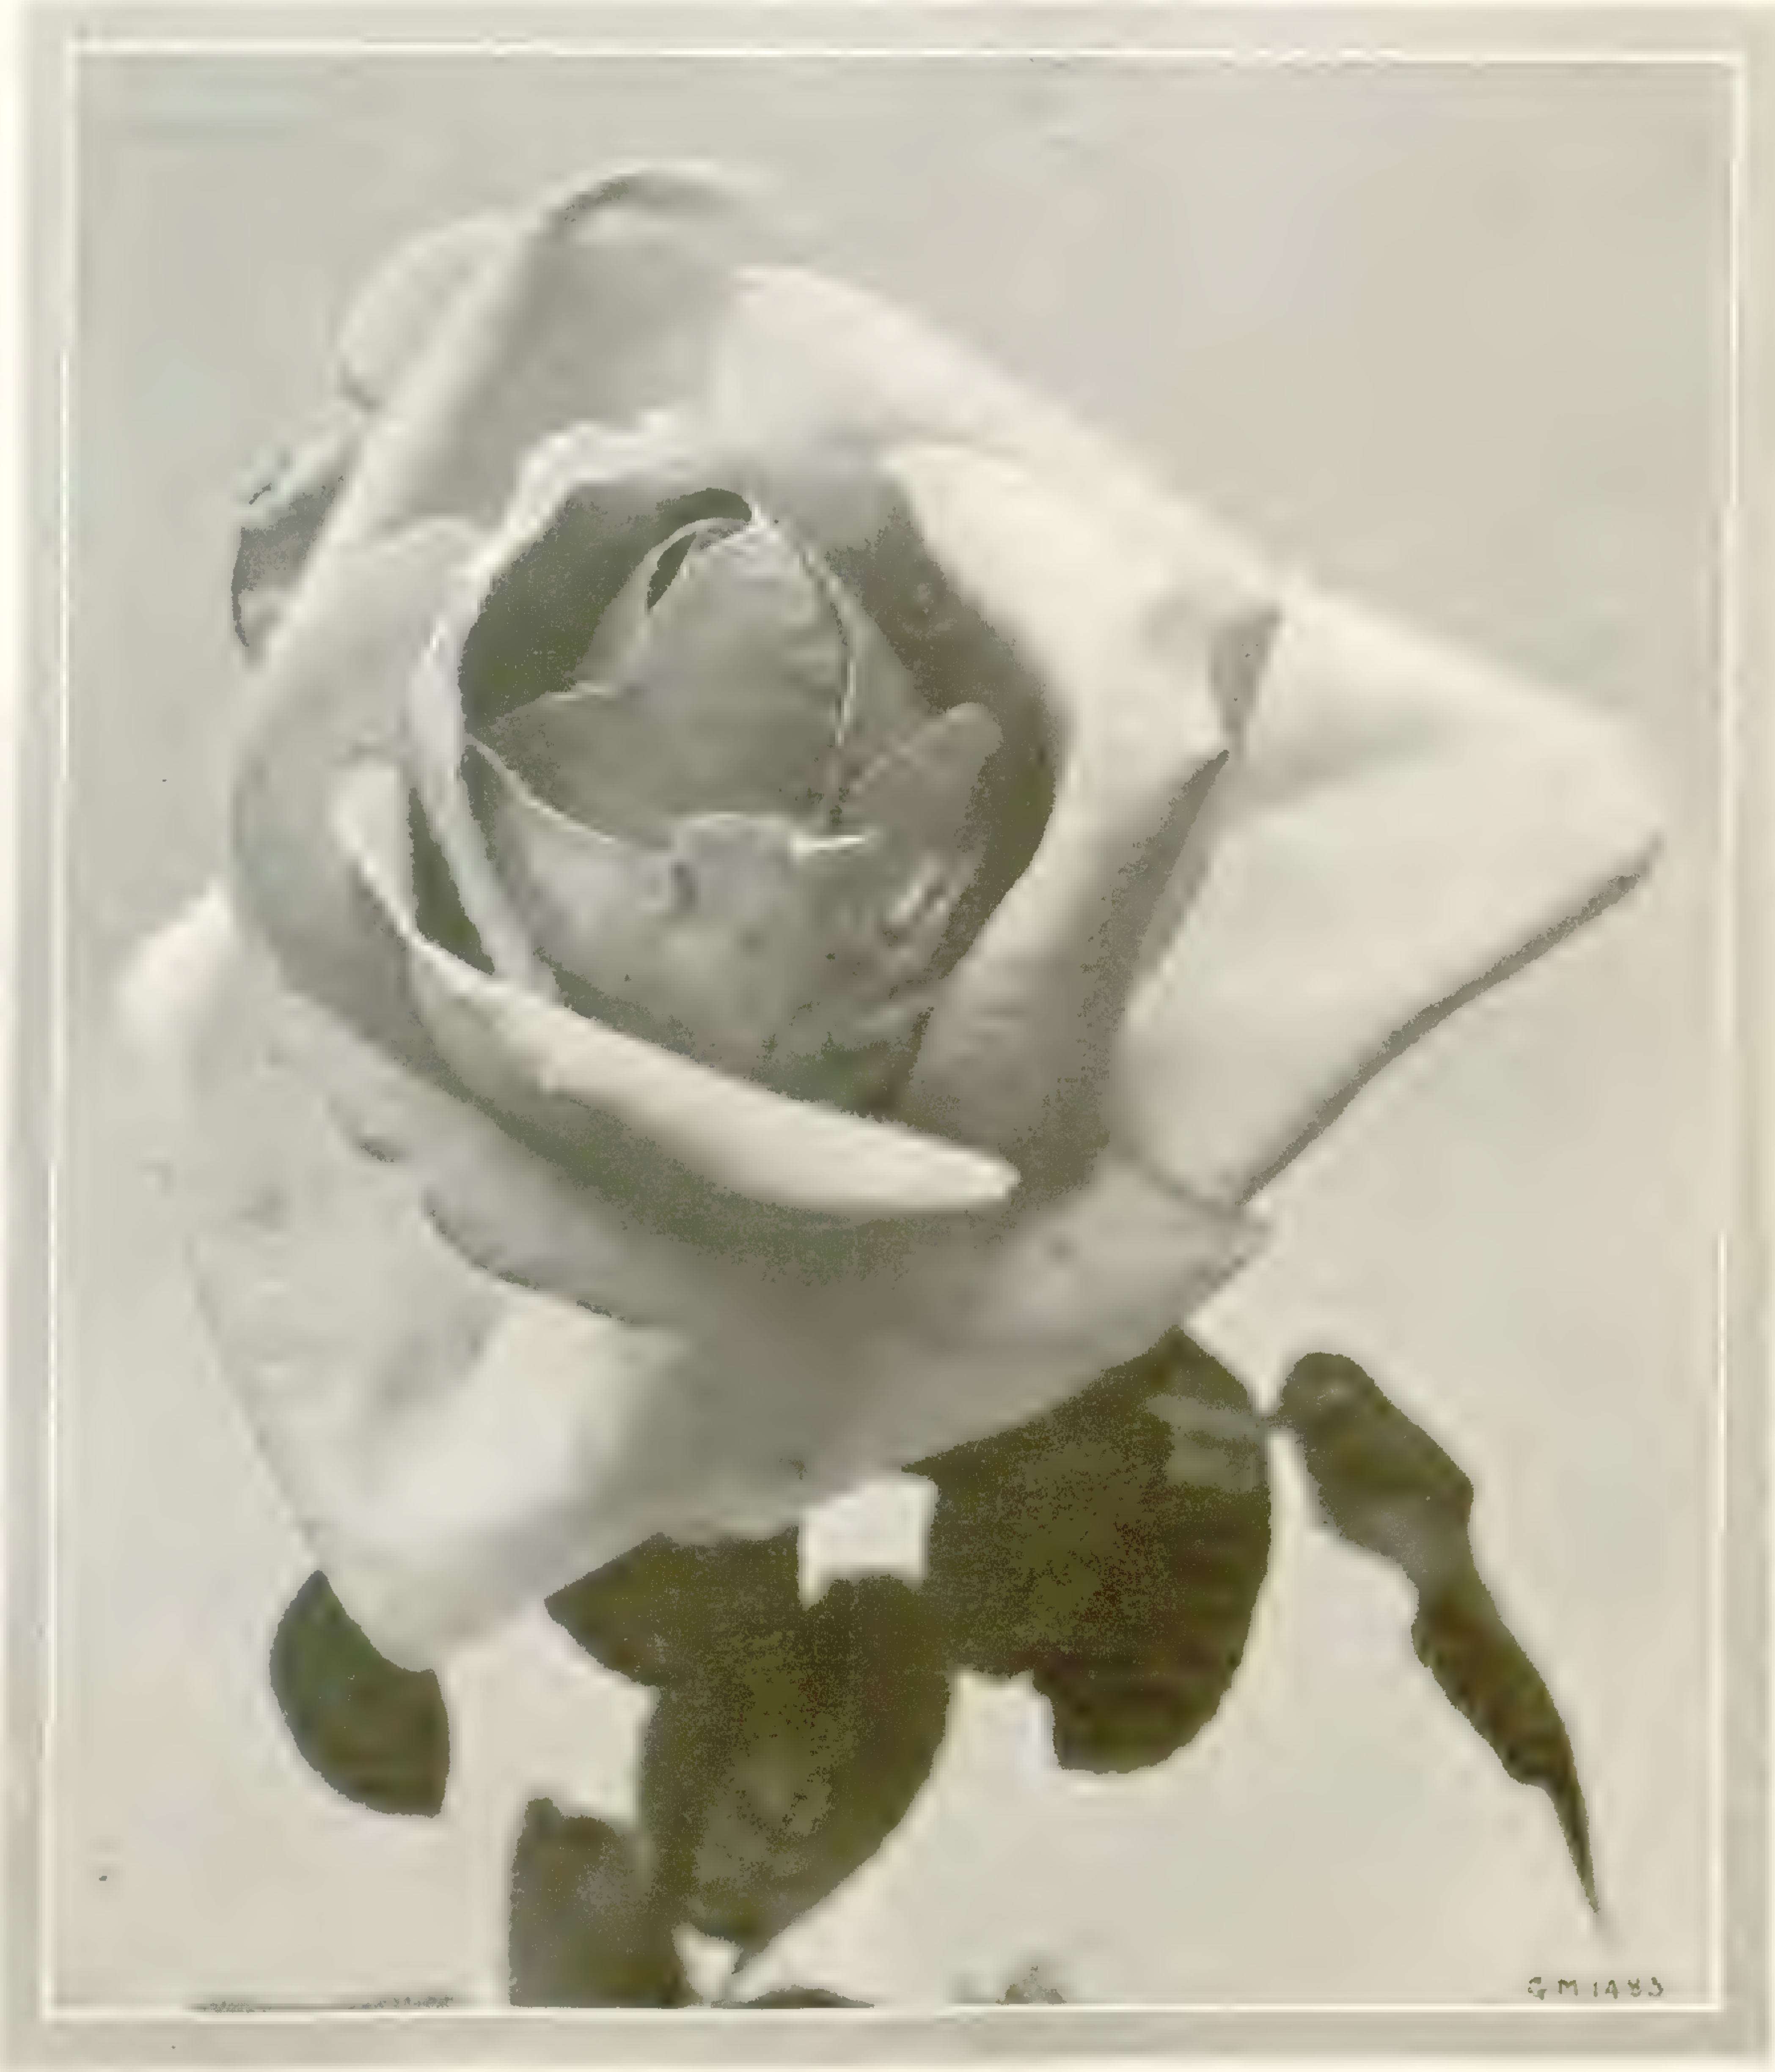
There are a few climbing varieties, or sports that deserve notice. Climbing Cramoisie Supèrieure is a strong grower. The next best, in my estimation, is Field Marshal, this is very bright in a warm position, or on a wall. It is a blood crimson shaded with amaranth, and quite distinct.

The dwarf-growing varieties make capital bedders, and are also very effective when used as edgings to the stronger-growing roses.

A. Piper.

NEW ROSE ELIZABETH.

A fine new rose that Messrs. Benjamin R. Cant and Sons, Colchester, have shown freely, and in excellent condition all through the rose season of 1910, is the one named Elizabeth, and figured herewith. The variety belongs to the H.P. section, and its broad petalled flowers are of a rich reddish-rose colour, rather deeper in the centre. From an exhibitor's point of view it should prove a useful addition, and one of the most successful of competitors regards it as a red counterpart of the famous white Frau Karl Druschki, and it is very like that popular variety in build, as well as in the character of its growth, spines, and leafage. Messrs. B. R. Cant and Sons have evidently a fine novelty in their new rose Elizabeth. The present illustration is from a photograph of an October flower.



ROSE ELIZABETH.
Messrs. B. R. Cant and Sons' new rose-red variety.

Potatoes grown in Great Britain during the current year show a decrease of nearly 36,000 acres, or over 6 per cent., as compared with 1909, and the area under this crop is the lowest returned since 1898.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CYPRIPEDIUMS.—The winter-flowering cypripediums are at the height of their flowering season. It seems only a few years ago since the writer of these notes was pointing out in the Gardeners' Magazine the advantage of these most useful orchids, their tractability under culture, and recommending their more general cultivation. As one of the pioneers of this movement, it is with no small amount of pleasure that I find, not only are these plants forming the greater part of the orchid groups exhibited at the meetings of the Royal Horticultural Society just now, but even the most humble amateur gardener finds pleasure in their culture. There can be no question but that these orchids may be induced to give satisfactory returns even in the neighbourhood of large towns and in smoky manufacturing districts, where the atmosphere is fatal to many of our commonest stove and greenhouse plants. There are scores of species, varieties, and hybrids that only a few years ago were almost worth their weight in gold that can be purchased for the modest outlay of a few shillings, and plants in bloom at that. This season gives an opportunity of making selections of desirable kinds, and I have frequently pointed out how preferable it is to select the plants while they are in flower rather than from a detailed list of suitable kinds.

THE EARLIER-FLOWERING KINDS, as they pass out of bloom, may be examined, and where it is desirable to repot this should be done without delay, as many of the roots will be in a more or less active state. We find that Cypripedium Fairieanum does best in the intermediate house throughout the year. As these pass out of flower repotting should be attended to. It is not always desirable to disturb the plants by dividing them, but it may be advisable to transfer them to large pots when the compost is still in a good state of preservation. There can be no doubt the plants thrive best where they have filled the pots with roots, but there is a limit beyond which begins the road to starvation. Providing there is ample lime rubble intermixed with the potting compost any reasonable shift may be afforded C. Fairieanum. We find about two-thirds turfy loam to one of peat the most suitable compost for this species. Practically the whole of the hybrids descended from C. Fairieanum are robust and vigorous growers. These may be repotted as they pass out of flower, and where it is desirable to make larger specimens it is advisable to cut the rhizome between the growths. There will frequently be found plants that have been growing with a single lead for many years, and with numbers of flowered growths behind it; now all leafy growths are capable of producing new growths, but they frequently wait for something to happen to the leading growth before they break into new life, hence the rhizome should be severed.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

STOKING.—During the past two or three weeks we have been experiencing quite wintry weather, especially for the time of the year, and stoking has needed a considerable amount of attention. This is a matter that cannot be left in the hands of an inexperienced journeyman. An occasional critical look round on the part of the head gardener will often do good, not merely from an economic point of view, but a few practical hints to the young man in charge will enable him to maintain the most heat with a minimum of fuel and labour. Whenever there are signs of very cold weather the temperature in the houses should not be allowed to run down at all during the afternoon; an early start should be made, and all fires and ash boxes given a thorough cleaning the first thing after dinner; do not try to make up a big fire immediately afterwards by filling the furnace, but just put on a few shovels of clean fuel, which, with plenty of draught on, will soon make a bright, clear fire, and this, later on, according to circumstances, may be added to or partially stopped. Where anthracite coal is used I find the young men are generally too fond of using the poker, thus breaking the half-burnt coal up finely, and in this state it burns very dull, and gives off very little heat. Once the furnace is thoroughly cleaned, and the fire well started, it is only necessary to add fuel in small quantities as it burns through, and thus build up a good bright fire which will give out a tremendous amount of heat over a long period. With coke as fuel more clinker will be made, and a good clearing may be necessary every three or four hours to keep up the desired temperature, but aim at keeping a moderately sized and bright fire rather than choke up the furnace, for it is not until the whole material is burnt through that the greatest amount of heat is obtained. Another point is that when a very bright medium-sized fire is banked up, and the boiler power is sufficient, there will be no difficulty in keeping the heat up during the night.

TEMPERATURE. — During the cold weather the temperature generally may be kept somewhat lower, but on no account should houses of crotons be below 65 degrees, though where a general collection of stove plants is grown in one house 60 degrees will be high enough, while for stove flowering plants about 55 degrees will suffice for begonias, poinsettias, euphorbias, etc., etc. Many of the summer stove flowering plants that may have been put in a cooler house to rest, such as borgainvilleas, clerodendrons, allamandas, etc., may now be pruned, and this will allow of their being stored away in a somewhat smaller space. Do not put these in too cool a house, or the results may not be altogether satisfactory. Even where they are planted out in the stove many of them will be quite matured enough for pruning, and if so they should be attended to at once, the plants growing underneath thereby benefiting by this extra light.

AMARYLLIS.—Where large quantities of these are grown some of those that flowered early in the season will be pushing up their flower spikes, and may, with advantage, be put in the stove, giving them a good soaking of water, but not before they have been surfaced over with a little fine soil, which will fill up the gap between the pot and the ball, caused by the contraction of the soil during the process of drying off. As the spikes begin to extend liquid manure will help to strengthen them. A batch of amaryllis early in the year will prove of much value for house decoration, as there are few flowers, particularly at that time of the year, that are so bold and effective.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

CHERRIES.—Where very early fruit is required a house containing trees that were fruited early last year should be prepared for starting in December. In forcing the cherry it should be borne in mind that it is particularly impatient of fire heat and sluggish atmospheres, and that if subjected to these conditions the setting of the fruit will be poor, and the fruit be liable to drop while passing its stoning stage. For the first fortnight merely close the house, slightly ventilating it when the temperature from the sun's warmth reaches 50 degrees, and close it again at 55 degrees, when the sun's power is waning. Use fire heat in a very moderate way, by merely warming the pipes sufficiently for the night temperature to be kept at 40 degrees, and that for the day, by artificial means, at 45 degrees, a rise of 10 degrees from the sun's influence being allowed after the house has had free ventilation. These conditions must be accompanied by a careful spraying of the trees with tepid water, a moderate degree of atmospheric moisture, and the necessary watering of the trees.

EARLY PEACH HOUSE.—The time that a peach house should be closed, with a view to starting the trees into growth, depends upon the date that ripe fruits are required and the varieties of peaches the house contains; for example, in order to have fruit ripe at a given date it would be unnecessary to force Amsden June, Early Alexander, Waterloo, Hales' Early, and similar varieties, so early as such varieties as Bellegarde, Dymond, Royal George or Noblesse. Directions were previously given for preparing the trees for forcing in this house. No fire heat should be employed for the first fortnight, nor need the house be ventilated unless the temperature reaches 50 degrees. Once fire heat is used maintain a night temperature of 40 to 45 degrees, and that for the day 5 degrees higher, allowing the usual increase from solar warmth. Upon fine days spray the trees and their surroundings with tepid water in the morning and early afternoon, but guard against keeping the buds constantly wet.

STRAWBERRIES.—For affording early supplies of fruit plants may be now placed upon shelves near the glass in suitable quarters, or, if preferred, have their pots plunged in a warm bed of leaves placed in a light pit. Only enough artificial heat to slightly warm the pipes should be used, and the ventilators of the structure should be left slightly opened both by night and day. Keep the plants sufficiently supplied with water to preserve the soil in a moist state, and as soon as they begin to grow afford them moderate supplies of diluted liquid manure, or other suitable stimulants. Spray the plants overhead early in the morning of fine days.

YOUNG VINES.—Vines raised from eyes last spring, and intended to be grown on in pots next year in order to fruit early the following season, should, now that they have lost their leaves, be cut down to two buds, dressed with styptic, and kept at rest until started into growth at the beginning of the new year. Thoroughly ripened laterals should be selected when vines are being pruned, to furnish eyes for propagating purposes. Keep the laterals cool, with their ends placed in moist soil, until the end of January or beginning of February, which is a suitable season at which to commence propagating.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

PEAS.—Where room can be found for a batch of peas under glass, either in houses or pits, now is an excellent time to commence sowing the seeds. There are various ways of raising the seedlings, but perhaps the best way is to sow them in ten-inch pots, to avoid further disturbance of the roots. Moderately drain the pots with a few pieces of crock, over this place a small amount of dried and partly decayed manure, to prevent the drainage from clogging, and to assist growth at a later date. The soil should consist of three parts decayed turf, one part of spent mushroom bed manure, a little leaf-soil, and a scattering of burnt garden refuse; place the mixture rather firmly to within three inches of the top of the pots, the remaining space will eventually be used for top-dressing. When sowing place plenty of seeds in each pot, thinning the seedlings to five or six plants when it can be seen which are the strongest. Cover the seeds with an inch of the finer soil, give a good watering, and then place the pots in unheated pits or on shelves near the glass in a greenhouse. Do not hurry the germination; in fact, a slow steady growth should be the aim throughout. Later on stake, tie, and syringe according to requirements. There are now many fine varieties for the purpose, and first-rate ones are Gradus, Edwin Beckett, Reading Giant, and Duke of Albany.

BROAD BEANS.—If these are sown in pots similar to peas they will yield some useful dishes. Care must be exercised when they come into flower to create a fresh atmosphere to assist the "setting" of the pods. The tops should be pinched previous to the flowering stage also, as this alone will further the setting immensely. Give frequent waterings with diluted farmyard manure, and occasional sprinklings of artificial manure to both beans and peas.

MUSHROOMS.—The early beds are now bearing splendid crops, and to maintain them satisfactorily too much fire heat must not be employed. Aim at a uniform temperature of 50 degrees, and the beds will be found to bear much longer, and the quality of the mushrooms will be superior than if subjected to a higher temperature. Beds in cold sheds will need more covering with prepared stable litter, which should possess a certain amount of heat when applied to stimulate the bed. Ten inches in depth will not be too much.

SALSIFY AND SCORZONERA.—These should now be very carefully dug up whole, the tops lightly trimmed off, and the roots laid away in heaps behind a north wall, covering them over entirely with fine soil. If severe weather sets in a covering of strawy litter should be placed over the mounds to prevent their becoming frozen. This rule applies to all root clamps in exposed places.

SEAKALE.—At this season it will be an easy matter to procure fine blanched heads, providing the grower has carried out the cultural details throughout the year. A supply, according to the demand, should be introduced into the mushroom house or like structure weekly. Exclude the light entirely to ensure proper blanching, water in, and syringe regularly. Put regular supplies of endive, and roots of chicory, and dandelion into a light-proof place, with a temperature of 50 degrees.—Geo. Ellwood, Swanmore Park Gardens.

NOTES OF OBSERVATION.

Rochea falcata.—If grown and flowered as were some specimens in the old days, this ancient inhabitant of our gardens would be more often met with than it is. It is one of the many succulent plants that we received from South Africa a century to a century and a-half ago, and for a time, were more popular than they are now. This rochea has a stout succulent stem, and very thick, fleshy leaves of a rather glaucous green tint. The flowers, borne in a terminal, flattened head, are small, but exceedingly numerous and closely packed together, their colour being bright red. The golden anthers, too, are very noticeable.—W. T.

Erythrina crista-galli. — This old garden plant, introduced from Brazil as long ago as 1771, though perhaps not so popular as it once was, is still to be found in many gardens. It is well worthy of a place therein, for towards the end of the summer, when in full bloom, it is certainly very striking. Grown in large pots and plunged outside when it is nearing the flowering stage, this erythrina usually forms a showy feature in Hyde Park. It produces a thickened, woody root-stock, from whence annual shoots are pushed up. It is only necessary to protect this root-stock from frost during the winter. Such being the case, it may be safely planted close to the wall of a warm greenhouse, the warmer the better, and so situated it will give little or no trouble, and flower annually.—W. T.

Lilium sulphureum. — The fact that this Burmese lily does not flower till the extreme end of the summer, or in autumn, stands it in good stead for the decoration of the greenhouse or conservatory at that period. By the time September reaches us many occupants of that structure are past their best, and this lily is therefore particularly valuable. From the large importations that have reached us within the last few years, it is now fairly well known, therefore it will suffice to say that it is of tall growth, with long trumpet-shaped flowers of a rich yellow inside, and creamy-white with a reddish tinge on the exterior. A notable and unique feature among lilies of this section is the presence of numerous bulbils in the axils of the leaves.—W. T.

PROBLEMS UNDER CANVAS.

From an exhibitor's point of view, I claim to know something about the show problems that require solving, but I know much more about them from a secretarial point of view, having had the honour to act as secretary for over twenty years. As a judge, too, I have seen another side of the question, and know what it is to be cross-examined on points that were not too clear to the disappointed exhibitor. A secretary too often has a full working committee when the prizes are being arranged, and especially do gardeners who are committee men attend then, but on the show day, too often, these are quite useless; not that they are to blame, because, as exhibitors, they must attend to their exhibits, and if they did not do so there would be no show. The remedy, however, is to elect fewer gardeners who are regular exhibitors. My experience is that competitors, broadly speaking, are quite the worst of committee men; there are exceptions, and some do not put their own aims too forward when preparing the classes. I prefer enthusiastic amateurs, who have a real love for flowers, and who work for the advancement of horticulture, and the general good of the society Too often the professional in committee men shows too plainly that position in the prize list is nothing to them outside the monetary value of the prizes. They often know it is impossible for them to obtain a higher position than the third prize, and yet they are content with the cash only, reputation of a high standard being quite a secondary consideration to them.

A secretary of a small cottage society has many more difficulties to contend with than one holding a similar position in a large society, because in the latter no liberty is given exhibitors in the time of entering; but in a small society, where every entry is eagerly looked for, it often happens that an exhibitor finds, when he is preparing his stuff, that he could have entered in several more classes, and when he arrives at the show he tells his story of how he found a good dish of carrots or a dozen cut blooms, and entreatingly asks, "May I put them up?" A secretary who can refuse such a request must have a hard heart, and the consequence is usually that space has to be allotted for such an exhibit, and some confusion or delay of necessity arises. Too often a judge may blame a secretary for want of punctuality, when, under such conditions, he hardly deserves such blame.

Very few of our large societies are ready for the judges at the appointed time. The most punctual secretary I ever knew was Mr. Dixon, when acting with the late Mr. Harland for the Hull Chrysanthemum Society. At two minutes to ten he could always be found in front of the clock, with the bell in his hand, as a signal to the exhibitors to leave the hall; talk about working like clockwork, that was the place to find it. I would therefore ask critics of the inexperienced order to withhold their sharp remarks until they make themselves acquainted with all the facts.

I am inclined to think that the experience of "H." as a judge of an ordinary show, either single-handed or with another or two, must be somewhat limited, or he would not suggest that all the collections should be judged by points, and the points entered on cards placed upon the exhibits. He ought to know that seldom is it necessary to point collections to arrive at a correct decision in the awards, and to point all collections merely to appease disappointed exhibitors is only adding to the task of the judges, and using up valuable time. A conversation of about two minutes' duration with an exhibitor after the awards are made will often do much towards influencing him in the future, but there are some judges who think it beneath their dignity to explain matters, and too often awards are made on a basis that requires much more explanation than such judges can give.

In regard to the problem of varieties versus species, the judges should carry out the published stipulations, even if these do not meet with their personal approval. Judges go to shows to carry out laws already made; they do not go to make laws, though they may criticise and expose errors. I think the exhibitor in question, who adhered to one variety of flower, was quite correct, and should be supported. There are many such problems that annually occur and have to be treated on strict lines. It is a safe plan to adhere strictly to rule, as a judge then has an unanswerable argument.

As to the question of dishonest practices much talk about fancied grievances of a disappointed exhibitor happily ends in smoke. Flagrant cases should be promptly checked, both for the welfare of the society and the individual, too. E. Molyneux.

SUMMER SHOWS OF 1910.

I was much interested in the recent article in the Gardeners' Magazine dealing with the summer shows of 1910, and particularly so in that portion dealing with the annual exhibition of the society to which I have the honour of acting as general secretary. The Handsworth Flower Show has been in existence for over half a century, and at the present time its acknowledged position is third in the list of Midland shows. I especially noticed that reference was made to the criticism on the fête portion of the exhibition, and, feeling that a little comment is justifiable, I venture to send these few notes, trusting you will find space in the columns for them.

I do not intend to dwell upon the merits and demerits of the perfectly innocent amusements provided as usual, and the isolated cases of adverse criticism had little or no weight anywhere, for they were speedily answered in an excellent "leader" in the Birmingham "Daily Mail," justifying the action of the committee. To quote the article in question . . . "In other towns floral fêtes and hospital and lifeboat galas are held in the public parks with the happiest results, and it may be in time something of the sort may become an annual fixture in Greater Birmingham. Under the circumstances, therefore, the committee will doubtless persevere with their efforts to develop the fête side of the undertaking."

Almost without exception similar entertainments are provided by societies who wish to keep their shows upon a sound financial basis (even the Birmingham Chrysanthemum Society, whose annual exhibition is now held in the largest permanent exhibition building in the provinces, i.e., Bingley Hall—will eventually have to provide some such "draw" to be a financial success). Among other shows, I had the pleasure of visiting Hanley upon both days of their floral fête, and it is not an exaggeration to say that they provide ten times the quantity of side shows and roundabouts, to the evident satisfaction of the visitors. By all means banish the objectionable features, but let the sources of innocent merriment remain. So long as they can win popular favour—and we fancy they will do so as long as human nature remains what it is—let the people's pleasures have full sway. There is too much grandmotherly coddling nowadays by the superior person. When the Socialistic Utopia arrives, and all our days are ordered out to us by State schoolmasters—thank goodness we shall be dead before then—the Bunthornes and Stigginses of this world will certainly see we uphold the national character for taking our pleasures sadly; until then a little more freedom and less cant would add to the national gaiety.

There is no doubt the Handsworth Show is THE Show of Birmingham and district, and if the Birmingham City Council lend yet more of their valuable assistance, as there is every probability of their doing, the exhibition bids fair to be second to none.

William G. Carradine,
Secretary to the Handsworth
Horticultural Society.

82, Soho Hill,
Handsworth, Birmingham.

PERPETUAL - FLOWERING CARNATIONS.
GREAT WINTER SHOW, at the HORTICULTURAL HALL, VINCENT SQUARE, S.W. TUESDAY, December 13th, 1910. Admission 1 to 5 p.m., 1s.
ANNUAL DINNER, Anderton's Hotel, E.C., same evening, at 6.30 p.m. Schedules and all particulars from Mr. E. F. HAWES, Royal Botanic Gardens, Regent's Park, London, N.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Aberdeen Chrysanthemum Society.

NOVEMBER 25 and 26.

The annual exhibition under the auspices of this society, opened by the Right Hon. Robert Farquharson of Finzean amid a large attendance of the elite of Aberdeen, was held in the Music Hall Buildings, Aberdeen, on the above dates. This popular winter exhibition has ever been a source of great pleasure to the citizens of Aberdeen, and there was no falling away in its popularity on this occasion, large crowds being present on both days. The entries, over 500 in number, showed a slight increase over those of last year, and constituted an exceedingly rich and attractive display, reflecting great credit on all concerned.

For some years past the display of large blooms has been a feature at the Aberdeen show, but this year the leading feature was the large number of blooms of single chrysanthemums, both in the pot-plant and cut-flower sections: in short, the show was specially noteworthy for its superb display of serviceable flowers. The texture and colour of the blooms gave evidence of much careful attention on the part of the growers, and the fine array of colour, from pure white and soft peachy-pink to golden-yellow and fiery-red, illustrated to the very best advantage what can be done in the cultivation of this popular winter flower.

POT PLANTS.

The section devoted to these was undoubtedly a strong feature of the show. The entries comprised a large number of shapely and well-grown specimens, and richly earned for the growers the hearty encomiums of the visitors. For the best group of chrysanthemums and other plants, arranged in semicircular form on a space 8ft. by 5ft., to be judged for quality and effect, there were good entries. The first place was given to Mr Robert Begg (gardener), Garthdee, Aberdeenshire, for an exquisite group from the point of quality. The setting was composed of Cocos Weddelliana, kentias, and adiantums and pteris. Mr. Begg's arrangement gave rise to some criticism on the part of veteran growers, being considered much too crowded, and not a few considered his edging at fault, so dense was it. In quality of blooms, however, Mr. Begg was far and away the best, and deservedly won the silver plate awarded. Second place went to Mr. John Mathieson (gardener), Craigielea, Aberdeenshire, for a very effectively-staged entry. The arrangement here was undoubtedly superior to the first-prize group, being light and airy, with every individual plant standing out prominently. The quality of the blooms, however, was distinctly inferior to those composing Mr. Begg's group. For six chrysanthemums, at least four varieties, Mr. Begg scored finely with very meritorious entries, taking first and second honours. For four pots, single chrysanthemums, undisbudded, Mr. A. Murray, Ashley House, Aberdeen, was a capital first, and he also carried off the leading place for two pots of single chrysanthemums, undisbudded, distinct. Mr. Murray's entries were very much admired, and were well ahead of those of his opponents. For four pots of decorative chrysanthemums, two each, disbudded and undisbudded, the leading place went to Mr. Alexander Duncan, Rubislaw Den House, Aberdeen, for capitally-grown entries. For two pots of decorative chrysanthemums, one each disbudded and undisbudded, distinct, Mr. Murray again came out first. For decorative chrysanthemums, undisbudded, any variety, Mr. James D. Smith, 275, Union Grove, Aberdeen, had a fine win. The entries of specimen chrysanthemums, disbudded, any variety, were a capital show, and certainly nothing finer has been seen at Aberdeen for many years back. Mr. Coutts, 47, Sunnybank Place, Aberdeen, won handsomely here with a beautiful specimen of Soleil d'Octobre, and was closely followed by Mr. Begg and Mr. Murray.

Ferns were not a large entry, Mr. Alex. Duncan, Rubislaw Den House, having matters pretty much his own way. Chinese primulas were also limited in numbers, but those forwarded by Mr. Begg well deserved their pride of place. As is his wont, Mr. Andrew Reid (gardener), Durris House, Aberdeenshire, had it all his own way for orchids, with magnificent entries. Winter-flowering begonias were well shown by Mr. William Dick, 96, Queen's Road, Aberdeen, and Mr. W. B. Cormack, Dyce, Aberdeenshire. Taken all over, the pot plants were undoubtedly an outstanding feature of the exhibition, and were well worthy the admiration evinced by all who saw them.

CUT FLOWERS.

The entries in this division reached a standard that has perhaps never been attained in Aberdeen; certainly it has never been bettered. The class for thirty-six blooms, twelve varieties, was a very fine one, and the competition was exceedingly close. In this class premier place was given to Mr. Alex. Morton, gardener to the Countess of Seafield, Cullen House, N.B., for a very fine assortment, composed of Algernon Davis, Elsie Fulton, Mrs. L. Thorn, Francis Jolliffe, Mrs. A. T. Miller, William Beadle, Victoria and Albert, Lady Talbot, J. H. Silsbury, Purity, Mrs. G. Mileham, and Mrs. C. Penford. The outstanding blooms were Mrs. A. T. Miller and Elsie Fulton, but all were noteworthy for their beauty of colour, texture, and symmetrical formation. Mr. James Jenkins, 419, Clifton Road, Aberdeen, took second place, with an entry little behind that of Mr. Morton's. Only two points separated these well-known growers—i.e., $106\frac{1}{2}$—$104\frac{1}{2}$. Mr. Jenkins' F. S. Vallis was unquestionably the finest bloom in the show, and certainly a better grown specimen has never been seen at Aberdeen. For twelve Japanese chrysanthemums, at least nine varieties, Mr. William Patterson, Minmore, Glenlivet, Banffshire, had a capital victory. While the gardener at Balmedie, Aberdeenshire, Mr. Patterson, sent some splendid entries to the Aberdeen show, and twice he won the cup for thirty-six blooms, although he never managed to carry it off entirely, but there are not a few experts who consider the cup ought to have gone to him. Be that as it may, Mr. Patterson, in his new home, seems to have lost none of his cunning, for his blooms were dense, heavy, and well grown. Mr. Jenkins was first in the section for six vases, and Mr. John A. Grigor, Seapark, Forres, N.B., carried off the first and second prizes for six Japanese chrysanthemums, the blooms being of exquisite colour and beautiful texture. Mr. Morton, Cullen House, carried off the leading honours in the class for yellow and white Japanese chrysanthemums, and also in the class for one vase of any variety. Mr. Morton chose for his entry in the last-named competition the variety William Beadle, and his three blooms were very fine, deep in colour, and splendid. His opponents here were a long way behind.

A feature of the show was the fine array of cut flowers of decorative and single chrysanthemums. There was a large entry in this class, and the leading place was taken by Mr. J. A. Grigor, for eighteen varieties. The colour and texture of Mr. Grigor's entry were of a quality much aimed at nowadays, and he included varieties comprising tints of the very latest character. Other exhibitors who did exceedingly well in this section were Mr. A. Grigor, Duff House, Banffshire, with nine varieties; Mr. Robert Begg, Garthdee, with twelve varieties; and Mr. A. Duncan, Rubislaw Den House, with six varieties.

Orchids were limited in numbers, but Mr. Andrew Reid, Durris House, has to be warmly congratulated on the splendid condition in which he exhibited those handsome exotics. Mr. Reid also exhibited something of a novelty in a basket of large citrons, grown at Durris House, which attracted considerable attention. Christmas roses were also a pretty show, and here Mr. William Milne, Corsindae Gardens, Sauchen, Aberdeenshire, had a capital first.

In the section for floral designs some artistic arrangements were shown. The majority of the prizes here were taken by Mr. Alex. Burns, jun., New Market, Aberdeen, and his daughter, Miss Alice Burns. This young lady, who recently started in business at 89, Victoria Road, Torry, a thriving suburb of Aberdeen, has to be congratulated on the fine display she made, betokening as it did the inheritance of the fine artistic taste of her forbears. One of her wreaths, composed of Western King, Mrs. Rundle, and white Pompon chrysanthemums, and measuring nealy 5ft. in diameter, was a really fine piece of floral work. Her baskets, too, composed of bronze and yellow flowers with asparagus, were deservedly admired. The best bouquets was entered by Mr. A. Burns, jun. A very artistic cross, entered by Miss Alice Burns, worthily gained premier honours. For a lady's spray and buttonhole bouquets, Mr. John Grigor, Forres, led the way in fine style. Altogether this was a very commendable section, and attracted the attention and earned the heartiest admiration of the visitors.

FRUIT.

The display here was very fine for a winter exhibition, the specimens being all clean, and of good size and quality. Apples were well shown, and the leading prizewinners were Mr. Charles G. Cumming, Pitgaveny, Elgin (kitchen and baking varieties), Mr. J. Coutts, Rosefield, Elgin (dessert). For pears, Mr. James W. Robertson, Letham Grange, Arbroath, had matters pretty well his own way with fine entries. Grapes were limited in number, but those shown by Mr. John Elder, Norwood, Cults, Aberdeenshire, and Mr. Robertson, Letham Grange, worthily earned for those gentlemen the chief places. The last-named was also first for tomatoes.

VEGETABLES.

This section was a good feature, being the largest lot ever shown at the society's exhibition. For a collection of vegetables, six varieties (tomatoes excluded), there were no fewer than eight entries, and the judges had considerable difficulty in making their awards. Messrs. J. and D. McKenzie, Lower Buxburn, by Aberdeen, carried off the premier honours with a very finely-assorted collection. The cauliflower and Brussels sprouts were very fine, while the carrots were perfect models. The potatoes were clean, shapely, and well grown, and the whole formed an entry the Messrs. McKenzie had good cause to be proud of. Mr. Harper, Tulliebelton, Perthshire, was second, his entry this year being inferior to the one that gained for him first place at this show last year. Nevertheless it was a capital entry, the leeks, celery, and onions being really fine specimens. Mr. John Garden, Broomend, Inverurie, N.B., made a very good third.

Potatoes were a superb display, and would have been hard to beat in any show. The chief prizetaker here was Mr. James Ferguson, Linton House, Sauchen, N.B., who had no fewer than five first prizes. His Grampians, Snowdrifts, and Prizetakers were greatly admired. Mr. William Webster, Muiresk House, Turriff, N.B., came next with fine dishes of Kepplestone Kidney, Dobbies' Royal Kidney, and King Edward VII. Savoys and cabbages were well shown, Mr. W. Ellis, Raeden, Aberdeen, gaining most points for these. For cauliflowers or broccoli, the Messrs. McKenzie, were first, and for celery Mr. Harper led the way. Mr. A. Gardiner, Drumduan, Aberdeen, had a well-deserved win for carrots. The others worthy of mention in this section were Mr. J. Ferguson, Linton House (turnips, yellow); Mr. Alex. McRae, Durris (turnips, Swedish); Mr. J. Garden, Inverurie (beetroot); Mr. William Ellis, Raeden (parsnips); Mr. Harper, Tulliebelton (leeks); and Mr. A. McLeod, Cluny Castle (onions).

AMATEURS.

The sections devoted to the exhibits of amateurs were exceedingly well filled, and reflected the highest credit on all concerned.

MISCELLANEOUS DISPLAYS.

Mr. William Dustan, florist, Holburn Street, Aberdeen, showed a large number of beautiful chrysanthemums belonging to the early-flowering section, well adapted for garden cultivation. Messrs. Wm. Thomson and Sons, Lim., Tweed Vineries, Clovenfords, had on exhibition a large entry of grapes, specially worthy of note being a fine exhibit of Gros Colmar. Messrs. W. Wells and Co., Merstham, had brought forward a fine display of their single chrysanthemums. Messrs. G. Bunyard and Co., Maidstone, had a most effective display of apples, and the British Columbian Government staged a magnificent exhibit of seventeen different varieties of apples, which attracted much attention.

The Executive Committee unanimously agreed to award the society's gold medal to the British Columbian Government for their fine exhibit. Awards of Merit were also given to Messrs. G. Bunyard and Co., for their apples; to Mr. Andrew Reid, Durris House, for the citrons grown there; and to Messrs. W. Wells and Co., Merstham, for their single chrysanthemums.

The show, financially and otherwise, was a decided success, and the admirable arrangements made by the courteous secretary, Mr. M. H. Sinclair, F.R.H.S., were all that could be desired, and reflected much credit on that gentleman's powers of organisation and administration.

Horticultural Club.

"THE AIMS AND SCOPE OF A PUBLIC PARKS DEPARTMENT."

On Tuesday, the 22nd inst., after the usual monthly dinner at the Hotel Windsor, Mr. Harry J. Veitch presiding, and a goodly number of members and guests being present, Mr. W. W. Pettigrew, superintendent of the Cardiff Public Parks Department, gave a very interesting address on the above subject, illustrating it with a large number of lantern slides, showing the very varied aspect of the question.

Preluding his address with a quotation from John Stuart Mill, that "the multiplication of happiness is, according to utilitarian ethics, the object of virtue," he proceeded to demonstrate that, whether the dictum was accepted or not, the proper object of authorities ruling parks and open public places in the midst of large communities, should undoubtedly be the multiplication of happiness. As this means not merely catering for the matured tastes of adults, but also for the physical enjoyment and healthy development of all ages from the baby in arms to those advanced in years, his first series of slides dealt with the provision in the spaces under his control for children of tender age, happy groups under their nurse's care being shown amid the daisies, or in their perambulators, older children romping in the fields provided for them, lads at cricket and football, and so on; while bowling greens were provided and kept in order for men of staider and less agile proclivities. Bathing was encouraged by the provision of a spacious lake, and those with a taste for music were shown as a varied crowd of all ages round a handsome bandstand. In one of the parks, too, a fine zoological collection at once amused and instructed the public in another direction, while cleverly and naturally constructed rockeries and well-furnished beds, provided material for the botanist and amateur horticulturist at the same time as they enhanced the beauty of the scene. Even fishing was not forgotten, the hatching of trout being one of the branches, and a successful one, at Cardiff.

In this way, the lecturer was happy in being instrumental in supplying wider interest in life than crowded cities can otherwise afford for the poorer inhabitants by giving opportunities of getting into closer touch with natural objects, developing æsthetic tastes, providing means of natural recreation in the open; and, in short, doing a multitude of things which tend to increase at once the happiness and the health of the community of every grade. The numerous slides shown as the lecture proceeded, many of which were very beautiful, and mostly taken by the lecturer himself, showed that in Cardiff at any rate, and under his fostering care, all the objects in view were attained to their utmost capacity.

In the subsequent discussion, in which Messrs. H. J. Veitch, W. Watson, and others took part, the value of this lecture was very fully appreciated, but strong expression was given to the obvious futility of confiding the superintendence on a most important scale, of such varied objects, varied but yet closely conjoined, all being part of a well-considered scheme, to any other than an individual who had had a long education in that particular line, and whose capacity not merely to conduct but to originate, had been proved in the same direction. The recent selection of a military man as ruler over the London Parks, in preference to skilled and experienced officials whose lives had been spent in the study and fulfilment of the manifold duties entrusted to them, evoked strong expressions of disapproval, not in any way in a personal sense, but at the gross injustice and unfairness of a council which publicly invites applications from the duly qualified, thus raising legitimate hopes of obtaining a post to which they were fully entitled, only to show that apparently from the outset the selection had been determined upon, regardless entirely of the qualifications stipulated for. This is undoubtedly an insult to such an honourable profession as that of the gardener or skilled horticulturist, especially when qualifications of such a technical character as the names imply are proved to be allied with high administrative ability, generally extending over a long series of years, and involving intelligent control of a large number of men.

After an unanimous expression of such opinion, a very hearty vote of thanks was given to the lecturer.

National Chrysanthemum Society.

There was a very good attendance at the Holborn Restaurant on Tuesday, November 29, on the occasion of the National Chrysanthemum Society's annual dinner. The King's Hall was beautifully decorated with chrysanthums by Mr. R. F. Felton, the flowers being supplied chiefly by the leading growers, while Mr. Thos. Bevan provided every one of the ladies and gentlemen with a buttonhole bouquet.

The order of the toast list was altered somewhat, and the first toast given was "The Donors of Special Prizes," which was in the hands of Mr. E. F. Hawes, who referred to the President's special prize, and the several cups, etc., presented by leading trade and amateur growers. This was responded to by Mr. J. H. Witty.

The loyal toasts were duly honoured, and then followed the presentation of the Holmes' Cup and other trophies won at the November Show, and the numerous medals won, and for each recipient Sir Albert Rollit, the president, who occupied the chair, had a few congratulatory words. Mr. Thos. Stevenson, as a young and able prizewinner, and Mr. Mease, as a veteran winner, received rounds of applause, as did Mr. N. Davis, who won Messrs. Clay and Son's special gold medal. A silver medal, suitably inscribed, was presented to Mr. W. Higgs, as a memento of his having won the Holmes' Cup for incurved blooms for twelve years in succession.

The toast of the evening, "The National Chrysanthemum Society," was given by the President, who expressed a hope that the society's future might be even greater than its past. He was very fond of the society, and had always taken a keen interest in the chrysanthemum. He had seen the society in many vicissitudes, but he was proud to be associated with those who had fought so long under the banner of the golden flower. He was glad to see so large a company, and especially so many ladies present. Sir Albert then referred to the history of the chrysanthemum, and paid a compliment to Japan. He thought no vehicle of colour was so great and complete as the chrysanthemum, and in this sense it was ahead of the rose. The room that evening proved the decorative value of the flower which came so beautifully in the dead season of the year. The flower, he considered, had never been so completely and largely exhibited as at the society's show at the Crystal Palace in November last. The attendance at that show and at the dinner that evening proved the great and growing interest taken in the chrysanthemum, and also the high position of the N.C.S., a society that had done so much to educate the public in regard to the flower, and extend its culture among the poor as well as among the wealthy. The society had also done its duty to other nations, and at the recent Paris Show he, with Mr. C. H. Payne and Mr. T. Bevan, had the honour of being judges, the opportunity of expressing the love flower lovers everywhere bear each other, and also the opportunity of inviting the French horticulturists to come over and compete with the British growers at the great International Show of 1912. He said that the Government had been taking steps to further horticultural education. He eulogised the work of the society's Floral Committee, and referred to the Chrysanthemum Conference to be held at Essex Hall on Monday next—a fine educational feature. Sir Albert returned thanks to all who had helped to further the society's interests, and said he understood that at the end of the year there would be a pleasant financial balance to the good.

Mr. Thomas Bevan, chairman of the committee, acknowledged the toast, and said he hoped Sir Albert would long continue to be president of the society. Referring to the Palace Show, he thought the only thing lacking was the fine old specimen plants, but at the Paris Show grandly-flowered specimens, 8ft. square, 5ft. high, and from 500 to 1,000 flowers apiece were to be seen in great numbers, and gave evidence of splendid culture and patience. Mr. Bevan made reference to several Continental exhibitions he had visited, and then returned thanks on behalf of the society.

Mr. J. T. Simpson proposed "The Chairman," and this toast was very heartily received, and accorded musical honours.

"The Exhibitors and Affiliated Society" was ably proposed by Mr. C. Harman Payne, who drew comparison between Continental and British chrysanthemum shows that were very interesting. He said that the groups now set up at our own shows by Messrs. Davis, Jones, Wells, and others, were not surpassed for excellence and elegance by any displayed on the Continent. Mr. F. W. Ladds briefly and suitably responded, and said that if the society ever arranged a tableau display as a whole he thought the members would be ready to fill in their parts. He hoped the society would another year give a prize for the best novelty of the season.

Thanks were returned to Mr. Starr and Mr. G. Caselton, of the Crystal Palace, for their many kindnesses, and to Mr. Felton for decorating the dinner tables. Mr. Starr and Mr. Felton responded, the latter saying he would some day like to decorate the dinner hall with chrysanthemums in a way that would do the society immense credit, and also be a great advertisement for the society. He would like to offer a piece of plate next year for the best contribution of chrysanthemums to the dinner function. Mr. D. B. Crane proposed "The Ladies and Visitors" in eloquent terms, and to this Mr. Titmus responded. "The Press," proposed by Mr. H. J. Jones, was responded to by Mr. C. H. Curtis, of the Gardeners' Magazine.

Chrysanthemum notabilities present included Messrs. C. Harman Payne, Thos. Bevan, J. H. Witty, D. Ingamells, D. B. Crane, W. Simpson, W. Higgs, Norman Davis, H. J. Jones, W. Wells, E. F. Hawes, T. Stevenson, R. F. Felton, W. Newton, E. Such, C. H. Curtis, W. Howe, W. Leech, and W. Mease.

Roading Gardeners' Association.

A splendid non-competitive exhibition was held in the Small Town Hall on Wednesday week. The hall has rarely presented a more attractive and beautiful appearance, taste in arrangement being combined with the choicest of fruit, flowers, and vegetables. Exhibitors were invited to make decorative displays, and given a free hand in the selection of material. The gardeners made splendid use of the opportunity afforded for the display of their skill in arrangement and for putting into effect their artistic inclinations. Such exhibitions make an appeal to the eye, quite apart from the undeniable merit which the culture of such produce demands; while the fact that the result is obtained without the introduction of the competitive spirit is in itself fit subject for commendation. There is little doubt that if the exhibition is made an annual one it will grow in popularity. The proceeds of the exhibition will be given to the Gardeners' Royal Benevolent Institution and Gardeners' Royal Orphan Fund.

Following is a list of the exhibitors, with the names of the gardeners in parenthesis: Mr. G. Stanton, winter reminders of summer beauty; Mrs. Noble (Mr. T. J. Powell), fruits and vegetables; Mr. S. B. Joel (Mr. F. Johnson), group of begonias and a group of chrysanthemums; Mrs. Austen (Mr. W. Bennett), eighteen dishes of fruit; Mr. J. F. Child (Mr. A. E. Partridge), vegetables and ten dishes of fruit; Mr. L. G. Sutton (Mr. F. Townsend), a group of chrysanthemums, a group of begonias, and a group of primulas; Mrs. Bland Garland (Mr. H. Wilson), group of plants, apples and grapes; Mr. S. Wheeler (Mr. T. Judd), group of plants and apples; Mr. F. B. Parfitt, fruit; Mr. H. Collins (Mr. A. F. Bailey), fruit; Mr. H. J. Wynn, fretwork; Mr. M. H. F. Sutton (Mr. H. C. Loader), chrysanthemums and vegetables; Sir Rufus Isaacs (Mr. E. Blackwell), group of primulas; Dr. Hurry (Mr. H. Booker), group of chrysanthemums; Miss Cripps (Mr. Durrant), group of plants; Mr. J. Walter (Mr. W. Barnes), large exhibit of fruit; Mr. F. Rushby (Mr. W. Winterbourne), cacti; Mrs. Waterhouse (Mr. F. Pitman), two bunches of grapes; Mr. C. M. Powell (Mr. G. Boxall), eight dishes of fruit; Sir W. Farrer (Mr. W. J. Townsend), eighteen dishes of apples; Mr. J. O. Taylor (Mr. T. Brown), four large ferns, six dishes of apples, and group of plants; Mr. E. Jackson (Mr. W. Brown), six dishes of apples and two bunches of grapes; the Hon. A. Mills (Mr. D. Harris), group of chrysanthemums, etc.; Mr. H. Pretty (Mr. H. Fulkes), group of Primula obconica; Mr. J. Ridges (Mr. G. Tovey), zonal geraniums and twelve dishes of fruit; Messrs. Sutton and Sons, exhibit of vegetables; Mrs. Collins (Mr. H. Goodger), 9ft. run of vegetables and fruit; Mr. L. R. Erskine (Mr. C. Earl), vegetables; Mr. A. Webb, twenty-four dishes of apples; Mr. T. R. Harman (Mr. T. Neve), twenty dishes of fruit; Mr. M. J. Sutton (Mr. R. Doe, jun.), chrysanthemums (group in corner); Captain Miller (Mr. H. Reeves), 6ft. by 4ft., zonal geraniums; Captain Wilson (Mr. H. Kent), carnations; Mr. L. Oldershaw (Mr. W. Butler), dishes of fruit; University College, Reading (Mr. F. G. Drew), vases of flowers; General Bunbury Thompson (Mr. J. Pigg), dishes of fruit; Mr. W. Pole Routh (Mr. H. House), fifteen dishes of apples; Mr. H. Dunlop (Mr. A. Giles), flowers for table decoration; Mr. H. G. Cox, bottled fruits; and Mr. E. J. Dore.

In the centre of the platform was a magnificent display of chrysanthemums and begonias from Mr. S. B. Joel's gardens at Maiden Erlegh. Seedling chrysanthemums, sent by Mr. Leonard Sutton, compared well with their more formal relations for decorative purposes. A meritorious group of single chrysanthemums was sent by Mr. M. H. F. Sutton. The exhibits of Mrs. Noble, of Park Place (Mr. T. J. Powell), occupied a table extending along the front of the platform. They included some good fruit, exceedingly fine home-grown citrons, lilies of the valley, salads growing in pots, and a box of young potatoes grown from retarded tubers. In the centre of the table was a novel and pretty table decoration, comprising an open umbrella and a star composed of Bougainvillea glabra and smilax. The table, running almost the length of the hall, was largely devoted to fruit. It was broken by two fine bays, one composed of Begonia Gloire de Lorraine and the other of Primula sinensis, both provided by Mr. Leonard Sutton's gardener, Mr. Townsend. Captain Leslie Wilson staged some choice carnations; while Sir Rufus Isaacs, contributed, with Mr. Herbert Pretty, of Elmhurst, some well-grown Primula obconica. The president of the association (Mr. F. B. Parfitt) sent apples which were in splendid condition, notable dishes being those of Peasgood's Nonsuch and Blenheim Orange. Mr. T. R. Harman and Sir William Farrer were also notable exhibitors of fruit. Mr. J. Walters' gardener, Mr. W. Barnes, brought some fine produce from Bear Wood, and made an exceedingly effective decorative exhibit with fruit, flowers, and berries. Under the gallery Mr. G. Stanton made an attractive show of his "winter reminders of summer beauty," in which he demonstrated the decorative value of dried everlasting flowers, statice, honesty, winter cherry, ornamental grasses, etc. Messrs. Sutton and Sons staged a fine exhibit of bulbous and tap-rooted vegetables. Mrs. Collins, Mr. L. R. Erskine, Mr. J. F. Child, and the University College, Reading, also made good exhibits of vegetables and fruit. Mr. H. G. Cox showed some bottled fruit in fine condition, the fruit being preserved whole in nothing but plain water. Among the kinds were Victoria plums, gooseberries, strawberries, and damsons.

Mr. L. Castle, the hon. secretary, is to be congratulated upon the success achieved.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, November 22.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. W. E. Ledger, J. Douglas, R. Hooper Pearson, A. Worsley, and F. J. Chittenden (hon. secretary), with W. W. Pettigrew (visitor).

PINE SEEDS.—Mr. J. Douglas, V.M.H., drew attention to the sale of the seeds of Pinus pinea under the name of "pignolia" in Bournemouth and elsewhere. These nuts are used for flavouring, etc.

GENTIANA PNEUMONANTHE FORMA ALBA.—Mr. Chittenden showed a white-flowered specimen G. pneumonanthe, found by Admiral Carr on Chobham Common, and already alluded to in these columns (see p. 372).

Cardiff Gardeners' Association.

Mr. J. Mountney presided over the usual fortnightly meeting of this association, held at the Sandringham Hotel, on the 22nd ult., when Mr. E. J. Lingwood, artist and garden designer, of Westleton, near Saxmundham, Suffolk, gave a most interesting and instructive lecture on "Banks in the Garden, and Their Treatment." The lecturer dealt with the subject in a most able manner, detailing the methods of making formal banks and terraces, and the different angles at which they should slope, showing diagrams illustrating this. He also showed how to convert untidy banks into most interesting parts of the garden, and gave a list of plants most suitable for planting thereon. Mr. Lingwood described the method of building dry walls, and the most suitable subjects for furnishing them.

A most interesting debate followed, in which most of the members took part; many questions were asked and answered, and the lecturer was accorded a hearty vote of thanks. The Chairman, in closing the meeting announced that on December 6 Mr. J. C. House, of Combe Nursery, Westbury-on-Trym, the representative of the Bristol Association, would give a lecture on "Herbaceous Perennials."

Bristol Gardeners' Association.

The usual fortnightly meeting was held on November 10, at St. John's Parish Rooms; Mr. Garaway presided over a good attendance.

Mr. Porter, of the Bath Society, gave a paper on "The Herbaceous Border." The Lecturer said the herbaceous border was necessary as a contrast to the stiff and formal appearance of the flower beds, being also valuable on account of the length of time flowers are secured. Mr. Porter recommended a situation with a background formed by shrubs or a wall, preferably the former, with a south or west aspect; a soil of a light nature he considered best, and when trenching previous to planting leaf-mould and well-decayed manure should be added. Propagation might be done in three ways—division, cuttings, and seeds. Mr. Porter gave a long list of kinds in three sections—tall, medium, and dwarf. Included in the former were bocconia, rudbeckia, aconitum, eryngium, verbascum, artemisia, delphinium, astilbe, and kniphofia. Medium height: Anchusa, campanula, cimicifuga, thalictrum, hemerocallis, phlox, and asters. Dwarf: Incarvillea, dictamnus, salvia, funkia, montbretia, isatis, and ostrowskia.

For two bunches of grapes Mr. Scott was first, Mr. Jennings second, and Mr. Shelton third. Mr. Hoskins, of Henleaze, was awarded a special certificate for a grand exhibit of chrysanthemums; among the best were Madame Julien Valet, Freda Bedford, and Felton's Favourite.

FORTHCOMING ENGAGEMENTS.

MONDAY, December 5.—National Chrysanthemum Society's Conference at Essex Hall, Strand; First session at 3 p.m., under the presidency of Sir Albert Rollit; evening session at 6.30 p.m., under the presidency of Mr. Thomas Bevan. There will also be a display of chrysanthemums from 3 p.m. to 9 p.m.

TUESDAY, December 6. — Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m., by Mr. C. Herman Senn, on "Cooking of Vegetables"; Scientific Committee, at 4 o'clock.

WEDNESDAY, December 7.—Perpetual Flowering Carnation Society's Winter Show at the Royal Horticultural Hall.

THURSDAY, December 8.—National Rose Society. Annual Meeting, at the Westminster Palace Hotel, commencing at 3 p.m.; Conversazione, 4.30 to 6 p.m.

THURSDAY, December 15.—Annual Meeting of the National Sweet Pea Society at the Hotel Windsor, commencing at 3 p.m.

TUESDAY, December 20. — Royal Horticultural Society; the Committees will meet at 12 o'clock to consider novelties, but there will not be the usual exhibition.

Fruit Pergola as recently erected.

Why not a Fruit Pergola next year?

Charming effects and excellent results can be obtained by training fruit trees on our improved Arched Espaliers. Order now, and get your fruit trees planted in good time.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

DRIED MAIDENHAIR FERN FRONDS.—We shall be obliged if any of our readers can tell us what special method is followed in the drying of maidenhair fern fronds for decorative purposes. At this season of the year bunches of dried fronds are offered for sale in bazaars, fancy shops, etc. A correspondent is asking for the information.

GROUPS OF PLANTS AND FLOWERS AT THE HORTICULTURAL HALL.—T. H., Blackburn: You are under a misapprehension. Neither nurserymen nor amateurs pay the Royal Horticultural Society anything for the privilege of staging a group of fruits, plants, flowers or vegetables at the Royal Horticultural Hall, Vincent Square, Westminster, nor, on the other hand, does the Royal Horticultural Society pay nurserymen or amateurs to exhibit. Those who exhibit need not necessarily be Fellows of the society. Notification of intention to exhibit must be sent to the secretary of the society, the character and size of the proposed display being stated. Space is then allotted according to the entries received, and it is not always possible to obtain the full amount of space desired. Exhibits of every kind must be ready for inspection not later than 11.30 a.m. All exhibits of plants, fruits, etc., must be staged so as to come under the purview of one or other of the committees, viz., the Fruit and Vegetable, the Floral (which includes shrubs, trees, ferns, and foliage plants), the Orchid, and the Narcissus and Tulip Committees. Items coming under one committee should not be mixed with those coming under another. Each should be staged separately at one distinct part of the whole group.

VIOLETS IN FRAMES.—G., Leighton Buzzard: It is quite impossible for us to say why your violets are not a success without first knowing how the plants have been produced and managed. There are two ways of commencing operations, and one is to secure young runners in quite early spring, and dibble them in a cold frame in sandy leafy-soil, and plant them out of doors in April. Another way is to pull to pieces at the end of March or early in April, the plants that have already flowered, and select the strongest single growths for planting. The site chosen should be an open one, and the soil in first-rate condition as regards food content and drainage. Heavy, cold soils are unsuitable. Plant the selected growths fifteen inches apart in the case of the robust single varieties, and a foot apart in the case of double varieties. The great point is to get the plants well started into growth before hot weather sets in, so as to reduce the need of watering and syringing, and prevent attacks of red spider. Keep the plot well weeded and hoed, and remove all runners as soon as they are seen. A light surface dressing of half-decayed leaf-soil in early summer will also serve to reduce evaporation. A frame or pit with a southern aspect must be provided, and if a single row of hot-water pipes runs round the structure so much the better, as a little heat may be turned on during frosty weather, and also in a spell of damp, cold weather, as this, with ample ventilation, will ensure a circulation of air among the foliage, and prevent damping of leaves and flowers. Good garden soil over sufficient drainage will suffice to put the plants in, though the addition of leaf-mould will usually be an advantage. Put the soil in the frame or pit a few days previous to lifting the plants, thus allowing it to settle down. Sufficient soil should be used to bring the plants within three or four inches of the glass, but ten inches of soil should be the least amount provided. Lift and plant the violets in the frames early in September; lift with as much soil attached to the roots as possible, and plant just so that the leaves of one specimen do not overlap those of its neighbours. Give a thorough watering immediately after planting, but do not put on the frame lights until the nights become very cold.

CORRECTION. — TOP-DRESSING LAWNS.—"Hybernia" writes: "Under the heading of "Top-dressing for Lawns," p. 912, and about half way down the column, for "to a depth of not more than a quarter of an inch," please read "to a depth of not more than an eighth of an inch."

GOOD APPLES FOR THE NORTHERN COUNTIES.—J. C., Newcastle: The following are apples highly recommended for the Northern Counties: Dessert apples—Golden Spire, Lord Grosvenor, Grenadier, Domino, Early Victoria, Liddell's Seedling (a local Northumbrian seedling), Duchess of Oldenburg, and Ecklinville for early varieties; Lane's Prince Albert, Bismarck, Bramley's Seedling, Newton Wonder, Northern Dumpling, Tower of Glamis, Warner's King, and Schoolmaster as late varieties. Good early dessert varieties are Beauty of Bath, Mr. Gladstone, James Grieve, Worcester Pearmain, Nunnick Red (a local northern variety), Irish Peach, and Lady Sudeley, with Allington Pippin, Sturmer Pippin, Blenheim Orange, Cox's Orange Pippin, and King of the Pippins as late sorts.

PRIMULA OBCONICA.—W. L. J., Staffs: The leaves are being carefully examined, and we will report again later. It appears as though the foliage has suffered from severe cold while damp.

SLUGS ON PEACH TREES.—G. P., Parkstone: If you cannot persuade your neighbour to deal with the slugs on his side of the wall you will have to take special precautions to prevent the pests from coming over the wall and doing harm to your peaches. A layer of small ashes, with the dust sifted from them, would be difficult for the slugs to surmount if laid along the top of the wall.

WEEDS ON LAWNS.—R. W., Holmwood: The lawn sand is the material referred to, and this can be obtained through any of the sundriesmen or nurserymen who advertise in our columns, and directions for use will be sent with the material.

NAMES OF PLANTS.

D. M. M., Hever.—See next issue.

H. M., Huddersfield.—Stachys lanata.

H. B., Exeter.—1, Solanum capsicastrum; 2, S. Melongena; 3, Lælia Perrini.

W. M., Holywood.—Probably a Hechtia; we hope to determine it by next issue.

R. D. W., Hertford.—1, Areca lutescens; 2, Primula floribunda; 3, Browallia elata.

S. L. O., Halstead.—1, Chironia linoides; 2, Leucadendron argenteum; 3, Plumbago rosea; 4, Artemisia abrotana.

M. G. S., Chalfont. — 1, Ligustrum lucidum; 2, Leycesteria formosa; 3, Berberis stenophylla; 4, Mahonia aquifolia; 5, Cedrus Deodara; 6, Cryptomeria elegans; 7, Garrya elliptica.

NAMES OF FRUIT.

L. E. B., Knebworth.—Uvedale's St. Germain.

F. E. R., Bournville.—1, King of the Pippins; 2, Bismarck.

M. E. J., Torrington.—1, Wealthy; 2, Loddington; 3, Newton Wonder; 4, Golden Noble.

O. G. C., Chester. — 1, Lord Derby; 2, Warner's King; 3, Dutch Mignonne; 4, Catillac.

J. G., Shrewsbury.—1, Cox's Orange Pippin; 2, Ribston Pippin.

W. N. P., Axminster.—1, Dumelow's Seedling; 2, Bramley's Seedling; 3, Sturmer Pippin; 4, Gravenstein; 5, Beurre Diel.

A. F., Lowestoft.—1, D'Arcy Spice; 2, London Pippin; 3, Warner's King; 4, Mère de Ménage; 5, Emperor Alexander; 6, King of the Pippins.

L. C., Alverstoke.—We have received the specimens, but, not being satisfied as to the name of the tall apple, we are making further comparisons.

G. N., Clitheroe.—We do not recognise the pear sent, it was not a characteristic specimen, and was badly marked with scab. You should winter-spray your fruit trees.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Frost.

Frost, popularly considered, simply means the result of a thermometrical fall below 32 degrees Fahrenheit, at which point water of ordinary purity congeals from a liquid into a solid. In calm weather aerial moisture becomes frozen into hoar frost as it is deposited, and if the temperature falls still lower we find the inside of our window panes covered with beautiful crystal foliage, due to the condensation of our moisture-laden breath upon them. As the frost continues all exposed water gradually becomes solidified downwards from the surface, while, in all probability, the aerial water which at a higher temperature would fall as rain, will be precipitated in little clusters of most beautiful hexagonal crystals to add a finishing touch to the now wintry landscape in the shape of snow. Very rarely, however, do we attach the idea of frost to anything else than water, and yet water is only one of the many things which are capable of existing in more than one form, determined by difference of temperature in the same way. Water, as we know, may be liquid as water proper, solid as ice, and gaseous or invisible in the form of vapour, and science, in these later days, has practically proved that all the solids, liquids, and gases which go to form our earth can be brought into any one of these three conditions if only sufficiently low or sufficiently high temperature can be produced to freeze, melt, or vaporise them, as the case may be. Unless the earth were warmed by the sun's genial rays, and hence protected from the inconceivable cold of space, nothing liquid would exist, the very air itself would be frozen and deposited as a snow upon an underlying shell of aqueous ice. On the other hand, if the earth were subjected to the temperature of the sun, or, at any rate, of its glowing envelope, everything solid would be vapourised, even the very metals themselves. As a natural result of this fact we are entitled to regard all solid bodies as frozen ones, all liquids as melted solids, and all gases as vapourised ones, due to temperatures far and away above their freezing point, though tolerable, or even pleasant, to humanity. Hence, under the hottest sun-blaze of the tropics we are surrounded on all sides by literally hard frost, and at the Poles themselves by temperatures of great height, as compared with the freezing points of the gases concerned. It is literally everywhere a question of degree. Leaving, however, this scientific aspect of frost in general, we may turn to consider the general effect of the frost popularly recognised. This is a great factor in horticulture as a natural force, which does an infinity of work in breaking up the hard and uncultivatable rocks beneath our feet into fertile cultivatable soil. A large proportion of our alluvials are due to frost, for, owing to the almost unique faculty of expansion of water, instead of contraction, in the act of congelation, every fissured rock exposed to rain, and subsequently to frost, is bound to be split up, and further fractured by the irresistible expansion of the enclosed water in its crevices. The fragments, sooner or later, find their way to the nearest stream by gravity and denudation, and there become mingled with the debris of vegetation, and, wearing down as they progress, are eventually deposited by wintry spate and inundating flood far beyond the banks of the parent stream, to form the alluvial soil, and the underlying gravels, by which the gardener eventually profits. Where lofty mountain ranges prevail, and soar above the line of perpetual snow, it is frost which draws that line, and piles up the burden of ice, born probably of tropical ocean waters, and wafted thither as beneficent clouds by the ocean breezes. Here, too, an infinity of preparatory work of the breaking down class we have indicated is effected. Go to the foot of one of the mighty glaciers which form the estuaries, as it were, of these rivers of ice, and see how the tumbling flood is laden with pulverised rock, while close at hand a huge moraine is sure to be found, destined sooner or later to perform the like service as a basis and food for plant culture. The very mountains themselves owe their shape to frost, which during æons has been chiselling them out and clipping them down, while in their lower and warmer levels, clothing themselves with vegetation to provide that admixture of humus which enriches the soil so liberally for the agriculturist, horticulturist, and humanity generally.

MR. JOHN C. CYPHER.

Mr. John C. Cypher, whose portrait we have the pleasure of giving in this issue, is one of the best known of the many members of the nursery trade, and possessing marked ability and a genial temperament, he is held in high estimation by his many friends. Mr. Cypher holds a foremost place in commercial horticulture as an exponent of the art of plant arrangement, and the success he has achieved as an exhibitor of groups of plants arranged for effect is known to our readers. The first prizes that have been awarded to the firm of Messrs. J. Cypher and Sons, of which Mr. J. C. Cypher and Mr. F. Cypher are the members, must amount to several hundred. They have exhibited groups at Shrewsbury during the past 17 years, and in all but three, they have been first in the great class, and on one occasion they obtained premier honours in two group classes. Altogether, they have been awarded about thirty firsts at Shrewsbury, including many of great value, for specimen stove and greenhouse plants. At York they have exhibited specimen plants and orchids for thirty years with unvaried success. At Taunton Messrs. J. Cypher and Sons have exhibited for a similar number of years groups and specimen plants, and have always had the first prize group. At Wolverhampton, Hanley, and Cardiff they have specially distinguished themselves, and at the Royal Agricultural Society's show at Gloucester last year they were awarded four gold medals, and at this society's show at Liverpool in July last they were the winners of two gold medals. Messrs. J. Cypher and Sons have for some years past been large exhibitors of orchids at the Temple Shows, and many are the medals and cups that have been awarded them. As regards the groups, the firm, we need hardly say, is practically Mr. John C. Cypher, for they are invariably arranged by him with, of course, the necessary assistance. Most competitors are good winners, and Mr. Cypher is one of them, but he is a good loser also. It may be that the occasions are rare when he suffers defeat; we can remember once finding a second prize on an arrangement of his, but he was in no ways perturbed. It is a matter of much interest that, while specimen stove and greenhouse plants now obtain but little attention, they continue to be successfully cultivated at the Cheltenham Nurseries, as evidenced by the collections contributed by the firm to the principal exhibitions where provisions are made for them, and by the positions they usually occupy in the keenest of contests. Orchids are largely and well grown by the Messrs. Cypher, and it is a quite common occurrence to find them staging finely developed specimens, not only at the Temple Shows, but in the competitive classes at the leading provincial exhibitions, or contributing choice varietal forms to the meetings of the Royal Horticultural Society at Westminster.

R.H.S. Lectures, 1911. The lectures arranged by the Royal Horticultural Society for next year include: "Recent Work in Seed Selection," February 20, and "Origin of Varieties," March 14, by Mr. G. F. Scott-Elliott, M.A., B.Sc.; "The Past History of Conifers," June 6, by Professor A. C. Seward, F.R.S.; and "The Origin and Structure of Aquatic Flowering Plants," April 11; "The Origin of Monocotyledons and Aquatic Dicotyledons," June 20; and "Theory of the Origin of Species and Varieties by Mutation," by the Rev. Professor G. Henslow, M.A., V.M.H. The lectures by Mr. Scott-Elliott will be the Masters' Lectures, for the year.

Vegetable Cookery was dealt with in a singularly able manner by Mr. Senn at the general meeting of the Royal Horticultural Society on Tuesday, and the Fellows who crowded the lecture hall gave ample evidence of their appreciation of the advice given. In his opening remarks he directed attention to the importance of vegetables as articles of diet, and to the desirability of effecting an improvement in their selection and preparation for the table. He suggested that, while the plain cooking of vegetables should be greatly improved, attention should be directed to cooking and serving them in a more varied manner than is the case in the majority of middle-class and other households, and this he showed could be done without any material increase in time or cost. It would, he said, be an immense advantage were the practice that obtains in France, Switzerland, and some other Continental countries to be generally adopted in this country. He referred to the great aid the stock pot, which occupies so important a position in the French kitchen, is able to render in an endeavour to improve the methods of sending vegetables to table. It was interesting to learn that Mr. Senn regards vegetable fats as distinctly inferior to animal fats in the cooking of vegetables, and that he has a strong objection to a mixture of flour and water being served with choice vegetables, as is so frequently done, under the designation of melted butter. The butter, said Mr. Senn, should be at least equal to the flour, but, if in a rather larger proportion, it is a distinct advantage, and with this statement we are in full agreement.

Arbor Day at Sandgate.—The Sandgate Society has decided to postpone the celebration of Arbor Day until after the General Election. At a meeting of the committee, over which Mr. Miall H. Judge presided, letters were read from Sir Edward Sassoon, M.P., Sir Alexander Cockburn, Sir W. Hart Dyke, the Poet Laureate, Mr. Henniker Heaton, M.P., the Rev. Canon Rawnsley, and others, all expressing the opinion that Arbor Day at Sandgate would not be a success if held before the conclusion of the elections.

Daffodils in Orchards. — We have on several occasions referred to the great charm of daffodils when growing in orchards formed with trees of sufficient age to present a picturesque appearance, and consequently are much interested in the coloured plate published with the issue of "Amateur Gardening" for December 3, which depicts an Essex garden in which the Emperor and other daffodils are so happily associated with old apple trees as to form a floral picture of great beauty.

The Fruit Conference that was held at the South Eastern College, Wye, on the 2nd inst., was a great success, for the papers read were of a high order of merit, and there were present between 500 and 600 persons more or less interested in the cultivation, packing, and marketing of fruit. The papers included "Grading and Boxing English Apples," by Mr. Raynham, of Marden; on "Marketing," by Mr. Hooper, of Pershore; on "Co-operative Fruit Marketing," by Colonel Borton, of Chevening, Yalding; and on "Fruit Salesmen's Commissions," by Mr. F. Neame. Railway charges were referred to by several speakers, and Mr. E. Vinson, who sat on the Commission of Fruit Culture a few years ago, said no evidence whatever had been submitted to that Commission, though it was sought for, to show that English railways gave any preferential treatment to foreigners over home growers. English growers could have the same terms of carriage as foreigners if they followed the example of the latter and combined and sent their goods in four-ton lots instead of in large numbers of small quantities.

A Hundred-guinea Cup for Roses.—The Saltaire and Shipley Rose Society intends to surpass itself in 1911, and is already obtaining designs for a hundred-guinea trophy for roses, but the class in which this trophy will be offered for competition has not yet been decided. The date of the 1911 exhibition is Tuesday, July 11. We see that the society made a profit of £58 11s. 5d. on the present year's working, and the total turnover was £473 9s. 1d. The income from subscriptions amounted to £138 10s. 9d., and the takings at the gate were £267 6s. 9d.

"**Repertoire de Couleurs.**"—The great disadvantage of this really valuable work is that being in two volumes with 365 loose sheets of colour it is practically impossible for purposes of comparison to use it in the open air or at shows and floral meetings. At the recent Chrysanthemum Congress in Paris Mr. Harman Payne pointed out how useful it would be for journalists, reporters, and others who frequent meetings where novelties of chrysanthemums, dahlias, roses, sweet peas, etc., are shown if a bound pocket edition, containing only those colours found in such flowers could be issued. It was resolved that a sub-committee be appointed to consider the question.

Bees and Pollination of Fruit Blossom.—In the course of investigations made at Oregon Agricultural College into the question of self sterility of apples, some experiments were made to ascertain the part played by the wind and by bees in pollenising fruit trees. Small glass slides 1 x 3 inches in size, smeared with vaseline, were placed at distances varying from 4 to 30 feet from large trees in an orchard, and at heights from the ground level to 9 feet. After an exposure of twenty-four hours the number of pollen grains found on each slide varied from 7 to 16. The trees were in the height of their blooming period, and a strong wind was blowing, so that it is concluded that the wind cannot be relied upon to transfer pollen from tree to tree. To confirm the point, the blossoms of a tree were emasculated, and the petals, by which bees are attracted, were removed. During the whole period that the pistils of these blossoms remained receptive only eight bees were seen to visit the tree, while more than twice that number were seen in half an hour on a tree that blossomed profusely 20 feet away. Out of 1,500 blossoms emasculated only five set fruit, from which it is concluded that fertilisation is almost entirely dependent on bees and other insects.

Orchid Pictures at the R.H.S. Hall.—A very interesting exhibit made at a recent meeting of the Royal Horticultural Society, Westminster, consisted of a hundred and twenty-two paintings, framed and glazed, and set up so that they could be easily inspected. These paintings represented fine varieties of orchids, or fine hybrids in the collection of H. S. Goodson, Esq., Fairlawn, West Hill, Putney, who was the exhibitor. It was a most interesting exhibit, and brought, as it were, the cream of the Fairlawn collection into view all at once.

Lime Sulphur Wash, which is now being officially recommended by the American Department of Agriculture for use against attacks of "scab" on the varieties of apples which are liable to have their fruits or foliage injured by the use of Bordeaux mixture, is the subject of an interesting contribution by Mr. E. S. Salmon to the current issue of the "Journal" of the Board of Agriculture. Mr. Salmon states that in his experiments lime-sulphur wash was found efficient in resisting the attacks of powdery mildew, and was not hurtful to the foliage of apples that are specially susceptible to injury from spraying with Bordeaux mixture. The lime-sulphur wash may be made first in a concentrated form by boiling together quicklime (in lumps) 50lb., flowers of sulphur 100lb., and water 50 gallons. Iron or zinc "coppers" are suitable, but copper ones must not be used. The procedure is as follows: Place 10 gallons of water in the copper, and start the fire. Add the 50lb. of quicklime. When the slaking is well started, add the 100lb. of sulphur gradually, and mix until a thin, even paste is formed, taking care to break up all the lumps of sulphur as far as possible. If too thick, a little more water can be added. When thoroughly mixed, add water up to the 50-gallon mark (using a measuring stick). Boil for one hour, adding water when necessary to keep it at the same level. The wash thus prepared will be an orange-red liquid, consisting of a solution of sulphides and polysulphides of calcium, together with small amounts of other sulphur compounds. There will also be a small amount of insoluble lime and sulphur. Strain through butter-muslin, and store at once where air cannot reach the liquid. This concentrated wash can be kept, until wanted for use, stored in completely filled and corked stone jars or in barrels. If in barrels, the surface of the fluid must be protected from the air by a layer of oil (mineral). The concentrated wash thus prepared will require dilution, and the amount of dilution which is necessary in order to avoid "scorching" varies with the character of the foliage or plant to be sprayed, and can only be ascertained by experiment. In his experiments Mr. Salmon used a wash diluted by adding from 20 to 23 gallons of water to each gallon of the concentrated wash. When diluted the wash must be used at once.

The Southampton Horticultural Society has fixed the dates of its exhibitions for 1911 as follows: Summer show (roses, etc.), June 27 and 28; carnations and sweet peas, July 28; and chrysanthemums and fruit, November 7 and 8.

National Vegetable Society.—This newly-established society held its annual meeting at the Horticultural Hall on Tuesday, and, as the pressure on our space compels us to hold over the report until our next issue, we would mention here that the report and balance-sheet presented to the members were of a highly-satisfactory character, and fully justified Mr. Alex. Dean, V.M.H., who presided, congratulating the members on the splendid work that had been accomplished during the year.

The Gardeners' Company.—In a note having reference to "What the Guild of Gardeners is Doing," the "City Press" writes: "What are generally termed the minor Guilds are showing at the present time an activity that is not a little remarkable, and certainly is most gratifying as a sign of the times. The Gardeners' Company may be quoted by way of example. A few years ago it was in a moribund condition, whereas to-day there is a strong Livery, and the Court have done splendid work in the direction of bringing the Guild into line with the horticultural craft. Proposals now before the company give further evidence of activities in near prospect. We believe that the Duke of Teck is about to be admitted to the Livery; that the Court are taking steps to associate themselves with the forthcoming visit of the Colonial Ministers of Agriculture to the country; and that it is also in contemplation to pay an official visit to Holland with an introduction from the Board of Agriculture to the Dutch Government. Stronger testimony to the usefulness of the Guild could not well be forthcoming." We are pleased to learn that the Company is acquiring strength, and that the Court is endeavouring to bring it into line with the gardening craft. We trust the endeavour may be successful, but do not exactly understand how the association of the Company with the Colonial Ministers of Agriculture, or making an official visit to Holland on the introduction from the Board of Agriculture, is likely to prove helpful in effecting the laudable object in view. Agriculture is not horticulture, and had the Company paid an official visit to Haarlem last spring during the celebration of the jubilee of the Bulb Growers' Society, and arranged to co-operate with the committee of the International Horticultural Exhibition to be held in London in 1912, it would have had abundant opportunities for giving evidence of its activities while keeping well within its province. There is ample time for the Company to become associated with the last-named undertaking, and should an official visit be made to Holland, an introduction from the Royal Horticultural Society, with which the Company has for a long series of years been closely associated, would accomplish all that is necessary to the visit being pleasant as well as profitable.

Professor F. O. Bower.—Two medals are annually given by the King to the Royal Society, and this year one of these medals was awarded to Professor F. O. Bower, in recognition, as stated by Sir Archibald Geikie, the president, of the great merit of his contributions to morphological botany, of which department of science he is the acknowledged leader in Great Britain. Professor Bower's early studies in this field (1880-2), on the genera Welwitschia and Gnetum, were marked by the discovery of the true nature of the two persistent leaves in Welwitschia. The next period of his work was given to a study of the morphology of the leaf. He developed in 1884 the idea of the phyllopodium or leaf-axis, and discussed in 1885 the apex of the leaf in Osmunda and Todea. This latter study was cognate to subsequent researches, the results of which were given in 1886 in a review of "Apospory and Allied Phenomena." This work, of much intrinsic interest, is important as having led its author to formulate the views advanced in 1890 in a memoir on "Antithetic as distinguished from Homologous Alternation [of Generation] in Plants." Another memoir, published in 1889, on "The Comparative Examination of the Meristems of Ferns as a Phylogenetic Study," prepared in the light of the then received belief that the leptosporangiate ferns are the more primitive, was followed in 1891 by a discussion of this question, in which Professor Bower advanced morphological reasons for reversing the hitherto accepted phylogenetic order. The new conclusion has proved to be in accord with palæobotanical results, and marked another distinct step in the advancement of botanical science. During the third period of his work, 1892-1903, Professor Bower's papers, including an important series on the spore-producing members,have resourcefully maintained the antithetic doctrine, and have afforded a striking instance of the advantage of a well-considered working hypothesis as a guide to investigation. The career of morphological research here outlined has been recently crowned by the publication (1908) of a book on "The Origin of a Land Flora," which is one of the "most important contributions to the advancement of natural knowledge, published originally in his Majesty's dominions," within the period prescribed in respect of the award of Royal medals.

Rainfall for November in Aberdeen.—The table given below—compiled at Cranford House, Aberdeen—shows the rainfall in Aberdeen last month, and the figures for the corresponding month during the past eleven years. It will be noted that the total rainfall last month—5.98 inches—has only once been exceeded in November during the eleven years, and only once in the same period has the number of days on which rain fell been exceeded:

Month of November.	Total depth.	Greatest fall in 24 hours.	Date	Number of days with rain.
1910	5.98	0.75	6	24
1909	1.65	0.35	11	15
1908	1.63	0.22	11	18
1907	2.39	0.77	26	14
1906	4.34	0.78	5	18
1905	6.83	0.88	26	23
1904	1.41	0.67	22	13
1903	3.46	0.54	15	24
1902	2.78	0.63	6	19
1901	2.27	0.56	20	17
1900	5.10	1.12	15	28

ROYAL HORTICULTURAL SOCIETY.

Although the exhibition at Westminster on Tuesday, December 6, was not a very large one it was very attractive and interesting. Orchids, notably the winter-flowering cypripediums, were in great force, and winter-flowering begonias were another great feature. Flower paintings were contributed by Miss F. Farrer, Acton, and Mrs. E. S. Ough, Streatham Common. The British Columbian Government kept up their splendid exhibit of apples from the Colonial Fruit Show, and the Dominican exhibit of fruits was also still on view. The Fruit and Vegetable Committee had a very short sitting, and appeared only to have a few seedling and other apples to discuss.

FLORAL COMMITTEE.

Chrysanthemums were largely shown by Messrs. W. Wells and Co., Merstham, and the great feature of their exhibit was the single varieties, beautifully shown in stands and vases; Merstham Jewel, Lady Furness (A.M.), Caledonia, Gerbera, Jane Russell, Framfield White, Cannell's Crimson, Doreen, and Pink Felicity. Mr. Frank Lilley, Guernsey, showed single and decorative chrysanthemums, but some of the flowers appeared to have suffered during the journey from the Channel Islands.

An interesting exhibit of begonias of the B. Gloire de Lorraine type was put up by Messrs. Thomas Rochford and Sons, Broxbourne. Besides the type there were the varieties of Alba grandiflora, Amabilis, Turnford Hall, Rochfordi, new (A.M.), the brightest of the whole set, and Mrs. L. de Rothschild. In each case there were one or more big baskets of finely flowered plants, and these were set amid ferns, funkias, crotons, and palms. The same firm put up a collection of crotons, and among those the broad-leaved variety Maurice Rouviere was conspicuously good. A batch of lily of the valley completed the exhibit. Messrs. James Veitch and Sons, Chelsea, contributed beautifully-grown decorative and single chrysanthemums in 48-sized pots, and batches of bouvardias, the bright Jacobinea chrysostephana, and the several varieties of their attractive hybrid winter-flowering begonias, the brightest of the lot being Winter Cheer.

Messrs. Wm. Cutbush and Son, Highgate, had Frank Galsworthy, Beacon, Lord Chas. Beresford, Lady Elphinstone, Glendale, May Day, and other fine perpetual carnations on view, and in addition had an interesting exhibit of dracænas, oranges, Phœnix Roebelini, etc. Mr. L. R. Russell, Richmond, exhibited ivies in great variety, eleagnuses, and other ornamental shrubs. Begonia Gloire de Lorraine and its varieties, poinsettias, Primula obconica, a good form, and a collection of the newer nephrolepises and other elegant ferns, came from Messrs. H. B. May and Sons, Edmonton.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co., Haywards Heath, had a beautiful display of winter-flowering orchids. In the centre were glorious spikes of Vanda cærulea, a lovely blue, associated with spikes of Odontoglossum armainvilliersense; at one end of the group was a batch of Oncidium prætextum, with some beautiful Brasso-cattleya. Special things were Odontioda Diana, O. Cassiope, Cypripedium Maudiæ, C. Niobe, Miltonioda Ajax, Odontoglossum Phœbe, O. Solon, O. ardentissimum, Lælio-cattleya Golden Oriole (very fine), and L.-c. Myrrha—all fine things. Mr. Edward V. Low, Haywards Heath, had a pretty plant of Sophro-cattleya Doris, and good examples of Cypripedium Waterloo (A.M.), a bold hybrid, C. Earl of Tankerville, C. Dora Crawshaw, C. Priam, and other good things.

From Westonbirt, Mr. Alexander, grower to Lieut.-Colonel Sir G. Holford, came Cymbidium Pluto, an interesting cross between C. Traceyanum and C. Mastersi; a fine plant of Vanda cærulea Bluebeard, with big blooms of brilliant colour; a splendid spike of Cattleya Arethusa, and a good plant of Cypripedium Draco. Mr. Hopkins, gardener to Francis Wellesley, Esq., showed a fine specimen of Cypripedium W. J. Mills, with eight flowers—this is presumed to be a cross between C. insigne Sanderæ and C. aureum. Mr. Menteith Ogilvie, The Shrubbery, Oxford, sent a splendid Odontioda Charlesworthi. Mr. Collier, gardener to Sir J. Colman, Bart., Gatton Park, Reigate, showed Calanthe Alpha, Cirrhopetalum picturatum, Zygopetalum rostratum, Cœlogyne Mooreana, Masdevallia Courtauldiana, and other interesting things. From Gatton there came also a grand old plant of Dendrobium speciosum nitidum. Mr. W. R. Lee, Plumpton Hall, Heywood, Leeds, exhibited Odontoglossum Rouge Dragon, with big rosy flowers, and the pretty O. Ceres.

Mr. H. Hill, gardener to S. Larkin, Esq., Ridgways, Haslemere, contributed a group of cypripediums and odontoglossums. Mr. R. G. Thwaites, Streatham Hill, brought up several sophro-cattleyas, including a good S.-c. Saxa. Mr Maurice Mertens, Ghent, again brought over some seedling odontoglossums. A fine plant of Lycaste costata from the Burford Lodge collection, shown by Mr. W. H. White, orchid grower to Sir Trevor Lawrence, carried large numbers of flowers. A specimen of Lælia anceps Amesiana, carrying ten spikes of its dark-lipped blooms, was staged by Mr. Bristow, gardener to Mrs. Temple, Leyswood, Groombridge. Cypripedium Clio was well shown by Messrs. J. Veitch and Sons; and Mr. Brooman White sent a good form of Oncidium sarcodes from Ardarroch.

A very pretty little group of cypripediums was staged by Messrs. J. Cypher and Sons, Cheltenham, and chief among the good things set up were C. Leeanum Corona, C. Van Dyke magnificum, C. Madame Jules Hye, C. Minos Veitchi, C. triumphans, C. Thalia gigantea, C. Charlesianum Cypher's var., and C. insigne Harefield Hall. An interesting group, chiefly of useful cypripediums, was arranged by Messrs. Mansell and Hatcher, Rawdon, Yorks, and here the leading features were C. insigne Sanderæ, C. Niobe, C. Leeanum compactum, C. arthurianum, C. insigne Dormanniana, C. Memnon, etc.

Some fine orchids were staged by Messrs. Sander and Sons, St. Albans, and these included the interesting Brassia Forgetiana, Cypripedium insigne Sanderæ with a dozen flowers, Houlletia Sanderæ, Odontoglossum Harryano crispum, Dendrobium formosum giganteum, and the brilliant Lælio-cattleya Haroldiana. Varieties of Lælia anceps were submitted by Messrs. J. and A. A. McBean, Cooksbridge, Sussex, who also had Cypripedium Fairrieanum, C. Leeanum, and C. insigne varieties.

Messrs. Armstrong and Brown, Tunbridge Wells, sent up a number of very fine cypripediums that included C. Niobe Westonbirt var., C. Actæus, C. Thalia Mrs. Francis Wellesley, C. Germaine Opoix Westfield var., C. Baron Schroder, C. Euryades splendens, C. Minos Youngi, C. Hitchinsæ, and a fine form of C. triumphans. From Messrs. Stanley and Co., Southgate, came a finely-flowered plant of Cypripedium Leeanum giganteum, and examples of C. insigne Harefield Hall, C. Minos Youngi, etc. The contribution from Messrs. Stuart Low and Co., Bush Hill Park, contained Cypripedium insigne Sanderæ, C. Arthurianum, Oncidium Cavendishianum, O. ornithorhynchum album, O. crispum, O. varicosum Rogersi, Masdevallia tovarensis, and Dendrobium phalænopsis.

The old useful and fragrant Zygopetalum Mackayi was freely shown by Mr. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge; there were thirty plants and an aggregate of sixty-two spikes.

AWARDS OF MERIT.

No first-class certificates were awarded on this occasion.

Award of Merit.—To Japanese chrysanthemum, Mrs. Gilbert Drabble, and to single Chrysanthemum Lady Furness, from Messrs. W. Wells and Co., Merstham; to Begonia Gloire de Lorraine Rochfordi, from Messrs. Thomas Rochford and Sons, Broxbourne; to Odontoglossum Rouge Dragon, and to Odontoglossum Ceres Plumpton Hall variety, from W. R. Lee, Esq., Plumpton Hall, Heywood, Lancs; to Vanda cærulea Bluebeard, from Lieut.-Colonel Sir George Holford (grower Mr. H. Alexander), Westonbirt, Gloucester; to Cypripedium Waterloo, from Mr. E. V. Low, Vale Bridge, Haywards Heath.

MEDALS.

Silver-gilt Flora.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver Flora.—To Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. James Veitch and Sons, Chelsea, for begonias and chrysanthemums; to Messrs. H. B. May and Sons, Edmonton, for ferns and flowering plants; and to Messrs. Thomas Rochford and Sons, Broxbourne, for begonias and crotons.

Silver Banksian.—To Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Jas. Cypher and Sons, Cheltenham, for orchids; to Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to Messrs. Mansell and Hatcher, Rawdon, Leeds, for orchids; to S. Larkin, Esq. (gardener, Mr. Hill), Ridgways, Haslemere, for orchids; to Lord Hillingdon (gardener, Mr. A. Allan), Hillingdon Court, Uxbridge, for zygopetalums; to Messrs. Wm. Cutbush and Sons, Highgate, for carnations, etc.; to Mr. L. R. Russell, Richmond, for shrubs; to Messrs. W. Wells and Co., Merstham, for chrysanthemums.

Bronze Banksian.—To Miss F. Farrer, Acton, and to Mrs. Oagh, Streatham Common, for flower paintings.

NEW BOOKS.

CARNATIONS, PICOTEES, AND PINKS.

By T. W. Sanders, F.L.S. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C.). Price, 2s. 6d., by post 2s. 10d.

An admirably illustrated book, in which the show, border, perpetual and Malmaison carnations, the show and border picotees, the border and laced pinks, the Indian pinks, the sweet william, and the many kinds of alpine pinks, all very showy and interesting plants for decorating the border or rockery, have full attention. The author tells the reader how to grow carnations and picotees for garden decoration and exhibition. He also describes the various other types, such as the marguerite, grenadin, and so on, showing how they may be grown as annuals for yielding a wealth of flowers for cutting, decorating the borders, and even the window-box.

The perpetual-flowering type is dealt with in a manner that becomes its importance, as also is the Malmaison section, both being of much value for greenhouse decoration and the supply of cut flowers in autumn, winter, and spring. Other useful features of the volume are the chapters on cross-breeding, manures, diseases, pests and diseases, and the very full lists of varieties of the various types. The latter, indeed, are most comprehensive in character, and practically include all the known kinds in cultivation. The volume is profusely illustrated with portraits of the best varieties of each type, is provided with an excellent index, and is throughout of so high an order of merit that it should be added to the bookshelf of all who are interested in the beautiful and fragrant flowers to which it is devoted.

PANSIES, VIOLAS, AND VIOLETS.

By William Cuthbertson, J.P. (T. C. and E. C. Jack, 16, Henrietta Street, London; and Edinburgh.) Price, 1s. 6d.

This is one of the series of handbooks that are now being published by the Messrs. Jack under the general title of "Present Day Gardening," and is of much interest as evidence of the high standard characteristic of the scheme formulated by the publishers, and now being carried out with so much success. The series, we learn, is based upon a plan prepared by the general editor, Mr. R. Hooper Pearson, whose ability is so well known as to render any reference to it unnecessary, and the object is to provide separate volumes on popular subjects covering every branch of horticulture. The list of the volumes in the course of preparation shows that the needs of those who take an interest in gardening has been accurately gauged, and that much judgment has been evinced in the selection of the writers. The book before us is a proof of this, for the author has for many years past devoted close attention to pansies, violas, and their allies, and is not less well versed in their history than in the details of cultivation, and the relative merits of varieties. So fully equipped is Mr. Cuthbertson with a knowledge of all that concerns the flowers to which the book is devoted, that no safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired, and, it should be added, that as a guide Mr. Cuthbertson is as pleasant as he is safe, for, possessing literary ability of a high order, he is able to interest as well as instruct his readers. The book is illustrated by eight coloured plates, which possess much merit, and is well bound.

DAFFODILS.

By the Rev. Joseph Jacob. (T. C. and E. C. Jack, 16, Henrietta Street, London; and Edinburgh.) Price, 1s. 6d.

This book belongs to the series published by the Messrs. Jack under the general heading of "Present Day Gardening," and will be welcomed by those who devote attention to daffodils as a pleasant and useful guide to their cultivation. The book, which is in Mr. Jacob's best style, opens with a short, but interesting, sketch of the history of daffodils, and in the chapters that follow ample information is given on their cultivation for exhibition and garden decoration, the raising of seedlings, classification, diseases, and the selection of varieties for various purposes. The selection for growing in the grass is rather weak, for the author states that all daffodils will succeed in the grass, and then mentions "a few that are a little out of the common." It may be that all the daffodils will succeed in grass, but they differ considerably in their relative merits for that method of culture, and it would have been more useful to direct attention to those of conspicuous merit than to have enumerated varieties of which some can only be successfully grown under special conditions. If we are unable to agree with the author upon this point we can heartily recommend the book to those of our readers, and their number we know to be large, who are interested in daffodils.

Lilium tigrinum Fortunei.—This is a very fine lily for the open border, and the latest to bloom of all the tiger lilies. Magnificent bulbs of this variety are sent here every year from Japan, and, what is more, they are sold at a comparatively cheap rate. Planted in some good soil they will reach a height of five to seven feet, and bear a large number of blossoms. The leaves and stems of this particular variety are more woolly than those of any other of the tiger lilies, while the flowers are somewhat paler. These large imported bulbs seem in many cases to exhaust their energies with the first flowering, as they frequently take two or three years to recover.—W. T.

Costus igneus.—This gingerwort is a native of Bahia, and it needs a stove for its successful culture. There it forms an exceedingly bright feature during the autumn months, and, indeed, often into the dull days of winter. Like many of its allies, this costus forms a thickened root-stock, from whence stout leafy shoots are pushed up to a height of eighteen inches or thereabouts. The flowers, borne in a cone-like head, are individually from two to three inches in diameter, and of a fiery orange colour. They are thin in texture, and do not last long, but a succession is kept up from one head for a considerable time. The plant needs fairly liberal treatment with a free supply of water when growing.—W. T.

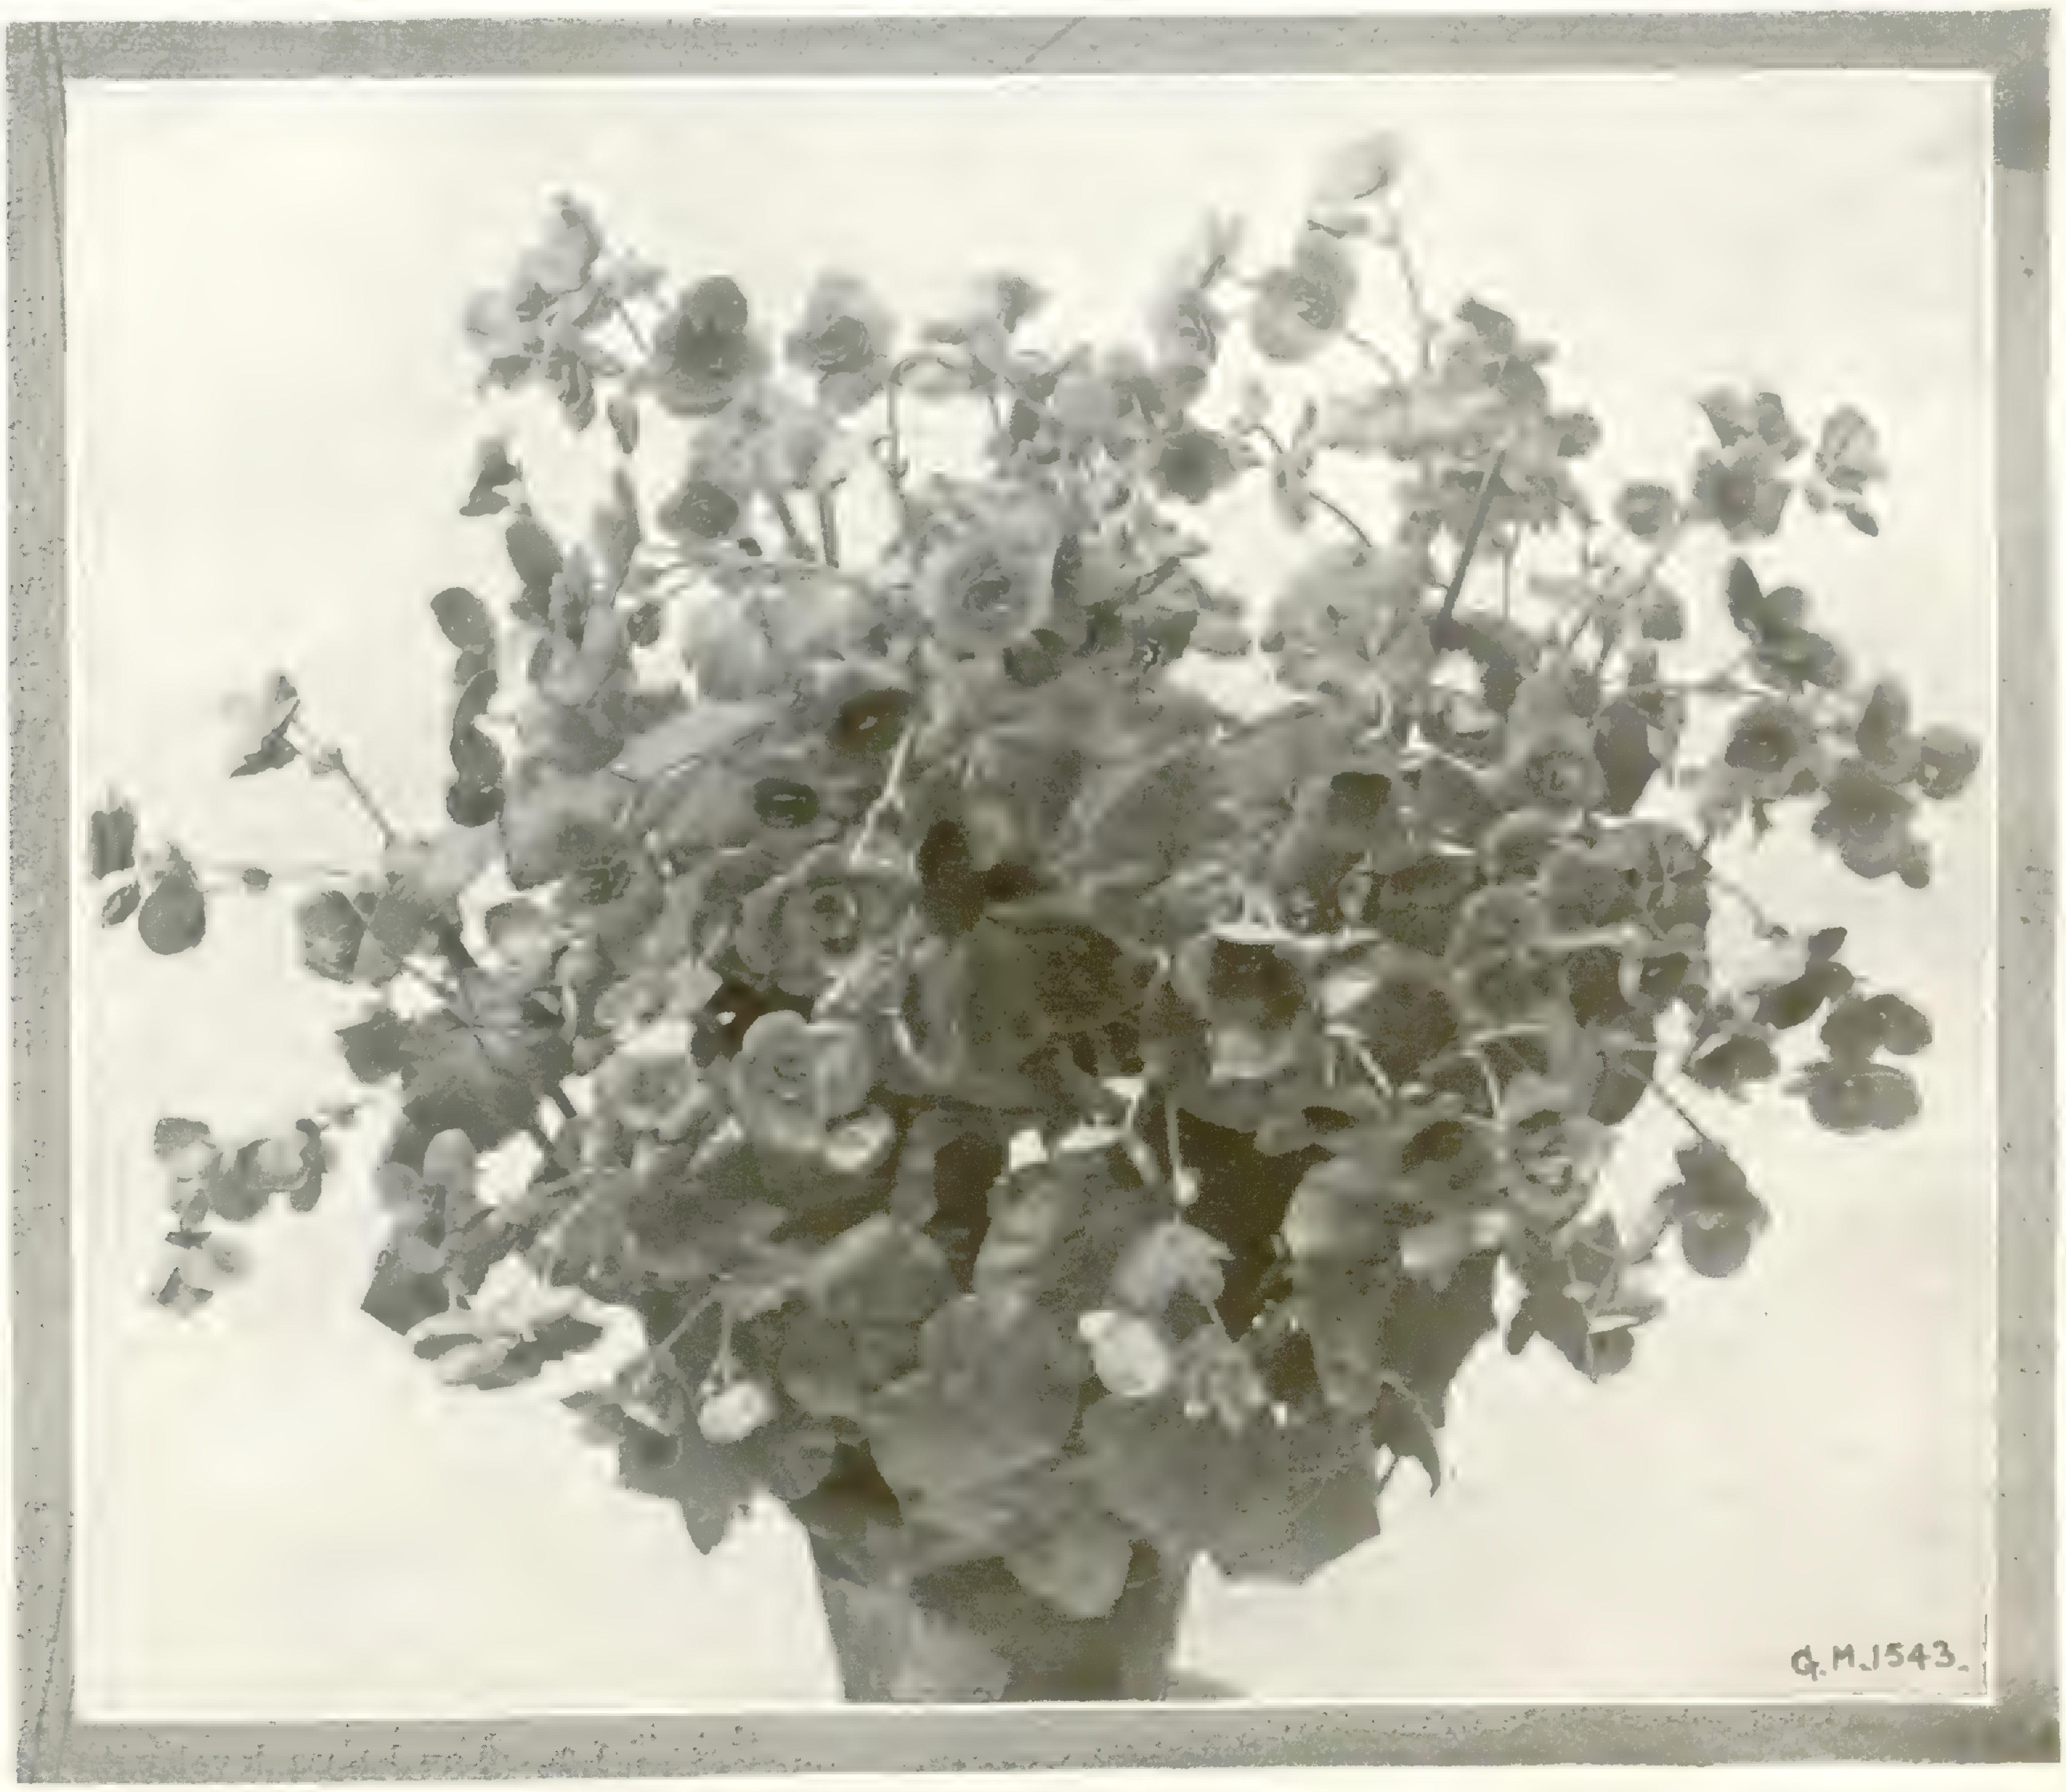
WINTER-FLOWERING BEGONIAS.

There are probably no flowering plants grown in the intermediate house capable of giving more pleasure during the dull winter months than the winter-flowering begonias of the type of which Ensign is an excellent example. This fine hybrid is, I would mention, of much value for decorative purposes, for it produces long, graceful branching sprays of bright carmine-coloured flowers, and whether arranged singly or massed in a group is very effective.

As much interest has been evinced in the bank of specimens of Ensign that I had the pleasure of contributing to the last of the November meetings of the Royal Horticultural Society, I am sending a few notes on the cultivation of the winter-flowering begonias belonging to the same group, with the hope they may be useful to those of your many readers who have to provide displays of flower at this season of the year, and, indeed, throughout the winter months. The practice which has proved so satisfactory here is to root the first batch of cuttings early in April. A compost consisting of equal parts of loam, peat, and leaf-mould is used, and the cuttings are placed in a propagating frame and the pots plunged in a bed where they receive the assistance of a bottom heat of 75 degs. As soon as well rooted they are put into three and a-half inch pots and maintained in a progressive state with the aid of a temperature of 65 degs., and a liberal degree of atmospheric moisture. When they are nicely rooted they are shifted into pots with a diameter of five inches, and as soon as these are filled with roots they are transferred to seven-inch pots, this last is the final shift, and is given early in July. The plants raised from cuttings rooted at a later date are put at their final shift into five and a-half inch pots.

The compost used throughout is prepared as mentioned above, but as a matter of course the loam and peat are not broken up so finely for the larger pots as in the case of the small pots. It is advisable to pot moderately firm, and to grow the plants in a structure in which a temperature of 65 degs. is maintained. Air must be admitted on all favourable occasions, the atmosphere being maintained in a buoyant state by damping down frequently and spraying the plants twice daily. It is advisable to close the house early enough in the afternoon to cause a rise in the temperature of 10 degs. above that mentioned in the preceding paragraph. Shading is a very important detail and must be strictly attended to, it being essential to screen the leaves from bright sunlight while admitting sufficient light to ensure a firm growth. Occasional fumigations will. it should be added, be necessary to prevent the attacks of insect pests.

A. R. Allan.



A FINELY-GROWN SPECIMEN OF BEGONIA ENSIGN.

Exhibited, with many other specimens, by Mr. A. R. Allan, at a recent meeting of the Royal Horticultural Society.

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

THE HIMALAYAN MAY APPLE.

Were the preferences of the podophyllums, or May apples, for moisture more studied these singular and pretty plants would ere now have attained a much greater amount of favour than they have ever received in British gardens. Fortunately, the increase in the taste for aquatic and bog plants has induced many to provide in their gardens positions for such flowers, and it is to be hoped that this will again lead to the podophyllums being more appreciated by reason of their being cultivated in really congenial positions, and not in the ordinary border or on the rockery, as we have, before now, seen them attempted. In moist and deep peaty soil, either in a prepared bed or by the margin of a stream or pond, these podophyllums will be at home.

P. Emodi is a very uncommon-looking subject, growing about a foot high, with handsome leaves, deeply divided into three lobes, but rounded in their outline, the lobes being again divided. In spring the white, rathed cupped flowers, are produced, and are about an inch across. Later the large edible berries, of a bright red,are produced, and these remain for some time on the plant. The leaves are very ornamental, both from their size and form. In suitable conditions they may reach as much as a foot across, but in dry soil they may be as small as six inches across. The Himalayan May apple is increased by division or by seeds sown under glass in autumn or spring.

S. Arnott.

THE POSITIONS OF AGRICULTURE AND HORTICULTURE.

When the British Gardeners' Association was established one of its objects was to raise the status of gardeners. How far it has succeeded, or is likely to succeed, in its estimable efforts in the above direction is not the point for discussion here, but there is an unmistakable agitation on foot just now for raising the status, not only of gardeners, but the industry of horticulture as a whole. People talk about agriculture as being the most important industry in the country, and in doing so one takes it that they refer to the cultivation of what are purely and simply farm crops. Even allowing this, and giving agriculture pride of place, horticulture is not far behind it, and people who are occupied in the latter industry are getting a bit tired of it being treated as a side issue of agriculture, when, as a matter of fact, it is too important to be placed in a subordinate position to anything.

When we consider the strides that horticulture has made in recent years, its importance to the country, the amount of capital invested in it, and the training, skill, and intelligence that are required to carry it on successfully, it can be fairly argued that any position of inferiority is an injustice, and as an industry horticulture is as indispensable to the nation as agriculture. Some people say that there is no need to particularise. In fact, they urge that horticulture is simply a branch of agriculture. I hasten to say that it is nothing of the kind, and to call a spade a spade, agriculture is farming, the growing of farm crops, management of cattle, sheep, horses, and the rest, and, in the same sense, horticulture is gardening, embracing the cults of vegetables, fruit, and flowers.

Without saying a word that is uncomplimentary to the skill and ability of the farmer, it cannot be urged that agriculture, as a business, requires more training than horticulture, or calls for the exercise of more skill and intelligence. Not a bit of it, and though this is no case for comparisons, an all round knowledge of farming is more readily and easily acquired than an all round knowledge of gardening. As evidence of this look round the private estates in the country, and note in how many cases men who have been trained as gardeners are acting as bailiffs, managing farms for their employers, and doing their work as well (sometimes better) as any farmer in the district. On the other hand, I wonder how many farm bailiffs have been given the management of their employers' gardens; and, if they were, I wonder what sort of a job they would make of it. This is rather a score for horticulture, for a man who has been trained in it can take up agriculture, and do it well, but you cannot reverse the positions and point to many instances of success.

PEAR LOUISE BONNE OF JERSEY.

To turn now to another phase, we have a Government Department, the much-abused Board of Agriculture and Fisheries. Mark you, there is nothing about horticulture in the title, but in some makeshift sort of way, the Board takes horticulture under its wing, though how many expert horticultural officials it possesses I am unable to say. One thing is ceretain, however, the Board is essentially a Board of Agriculture, and by this I mean farming, whereas horticulture comes in somewhere, I am not quite sure where, but its position is subordinate. Now this is the very thing that horticulturists are complaining about, and they ask to be put on equality with agriculture. Horticulturists may, or may not, be concerned in the reform of the House of Lords, but they certainly ask for some reform of the Board. In short, they want a Board of Agriculture and Horticulture (it doesn't matter to them whether Fisheries should be added as well), and they may work under the same roof if necessary, but they should be separate Departments, one on equality with the other, having their own experts in agriculture, on the one hand, and horticulture on the other. Reforms are not made rapidly, but it is only a question of time when these things will be.

A straw will indicate the way the wind is blowing, and there are plenty of signs to show that horticulture intends to stand on its own foundation, and be under the wing of nobody. Some movement is being made, too, and only recently I observed a proposal that there should be a Standing Committee of the Central Chamber of Agriculture formed to deal with matters concerning fruit culture and market gardening. In other words, this is to be a Horticultural Committee.

Now and then one sees horticulture getting an unpleasant knockback, instead of being encouraged, as, for instance, in the case of the London County Council, which, when it wants a chief officer for its parks, makes it plain that it does not want a horticulturist, but the head of a department, and the conclusion one arrives at from the appointment is that the individual chosen for the office need have no practical knowledge of the department of which he is the head. It is to be hoped that when a special Department of Horticulture is formed under the State that the example of the London County Council will not be followed in the appointment of officials.

In these days both agriculture and horticulture play an important part in education, but here again the craft which the GARDENERS' MAGAZINE represents is subordinate. Generally speaking, teachers of horticultural subjects are remunerated on a lower scale than those who teach agriculture, though there seems to be no logical reason why they should, as a lecturer in horticulture needs as much experience and practical training as a man who sets out to be a teacher of agriculture.

Speaking further of this matter, I have just read through a scheme for rural development submitted by the Rural Education Committee of the County Councils Association, and notice various suggestions about the appointment of Agricultural Instructors and Advisers, and Agricultural Organisers, but there is very little said about the need of Horticultural Instructors and Organisers, though experience shows that the demand for horticultural teaching is unsurpassed by any other department of rural education. In fact, the whole scheme throughout puts horticulture in a distinctly subordinate place, and it is difficult to see just exactly where it comes in, because after suggesting that each county should have a resident Agricultural Instructor and Adviser, and indicating what his duties should be, the committee puts down as further possible duties the provisions of a central county garden, demonstration allotments, and the laying out of gardens and demonstration plots, these matters being, one would think, distinctly the work of a Horticultural Instructor and Adviser.

In fact, all the way through it is the old story of giving horticulture a subordinate place in the arrangements, and this is the kind of thing that horticulturists are becoming rather tired of; they do not begrudge agriculture any of its privileges, but they claim that horticulture is an industry of sufficient national importance to be placed on a level with agriculture.

G.

Sutherlandia frutescens.—This, known as the Bladder Senna of the Cape, owing to its curiously inflated seed pods, is a decidedly pretty greenhouse shrub. The leaves are pinnate, and the drooping scarlet flowers are a good deal suggestive of those of Clianthus puniceus. As a rule the flowers are succeeded by the large conspicuous pods. Seeds are readily obtainable, but the plants raised in this way do not flower so freely in a young state as those struck from cuttings.—W. T.

Aristolochia elegans.—For a house of moderate dimensions where an intermediate temperature is maintained, this is a very desirable climber for draping a rafter, or for any similar position. Compared with many aristolochias, it is of a neat habit of growth, and the pretty shell-like flowers are borne in great profusion. They are distinctly netted with purplish chocolate on a greyish ground, with a deep-coloured blotch toward the centre. A succession of blossoms is kept up for some time.—W. T.

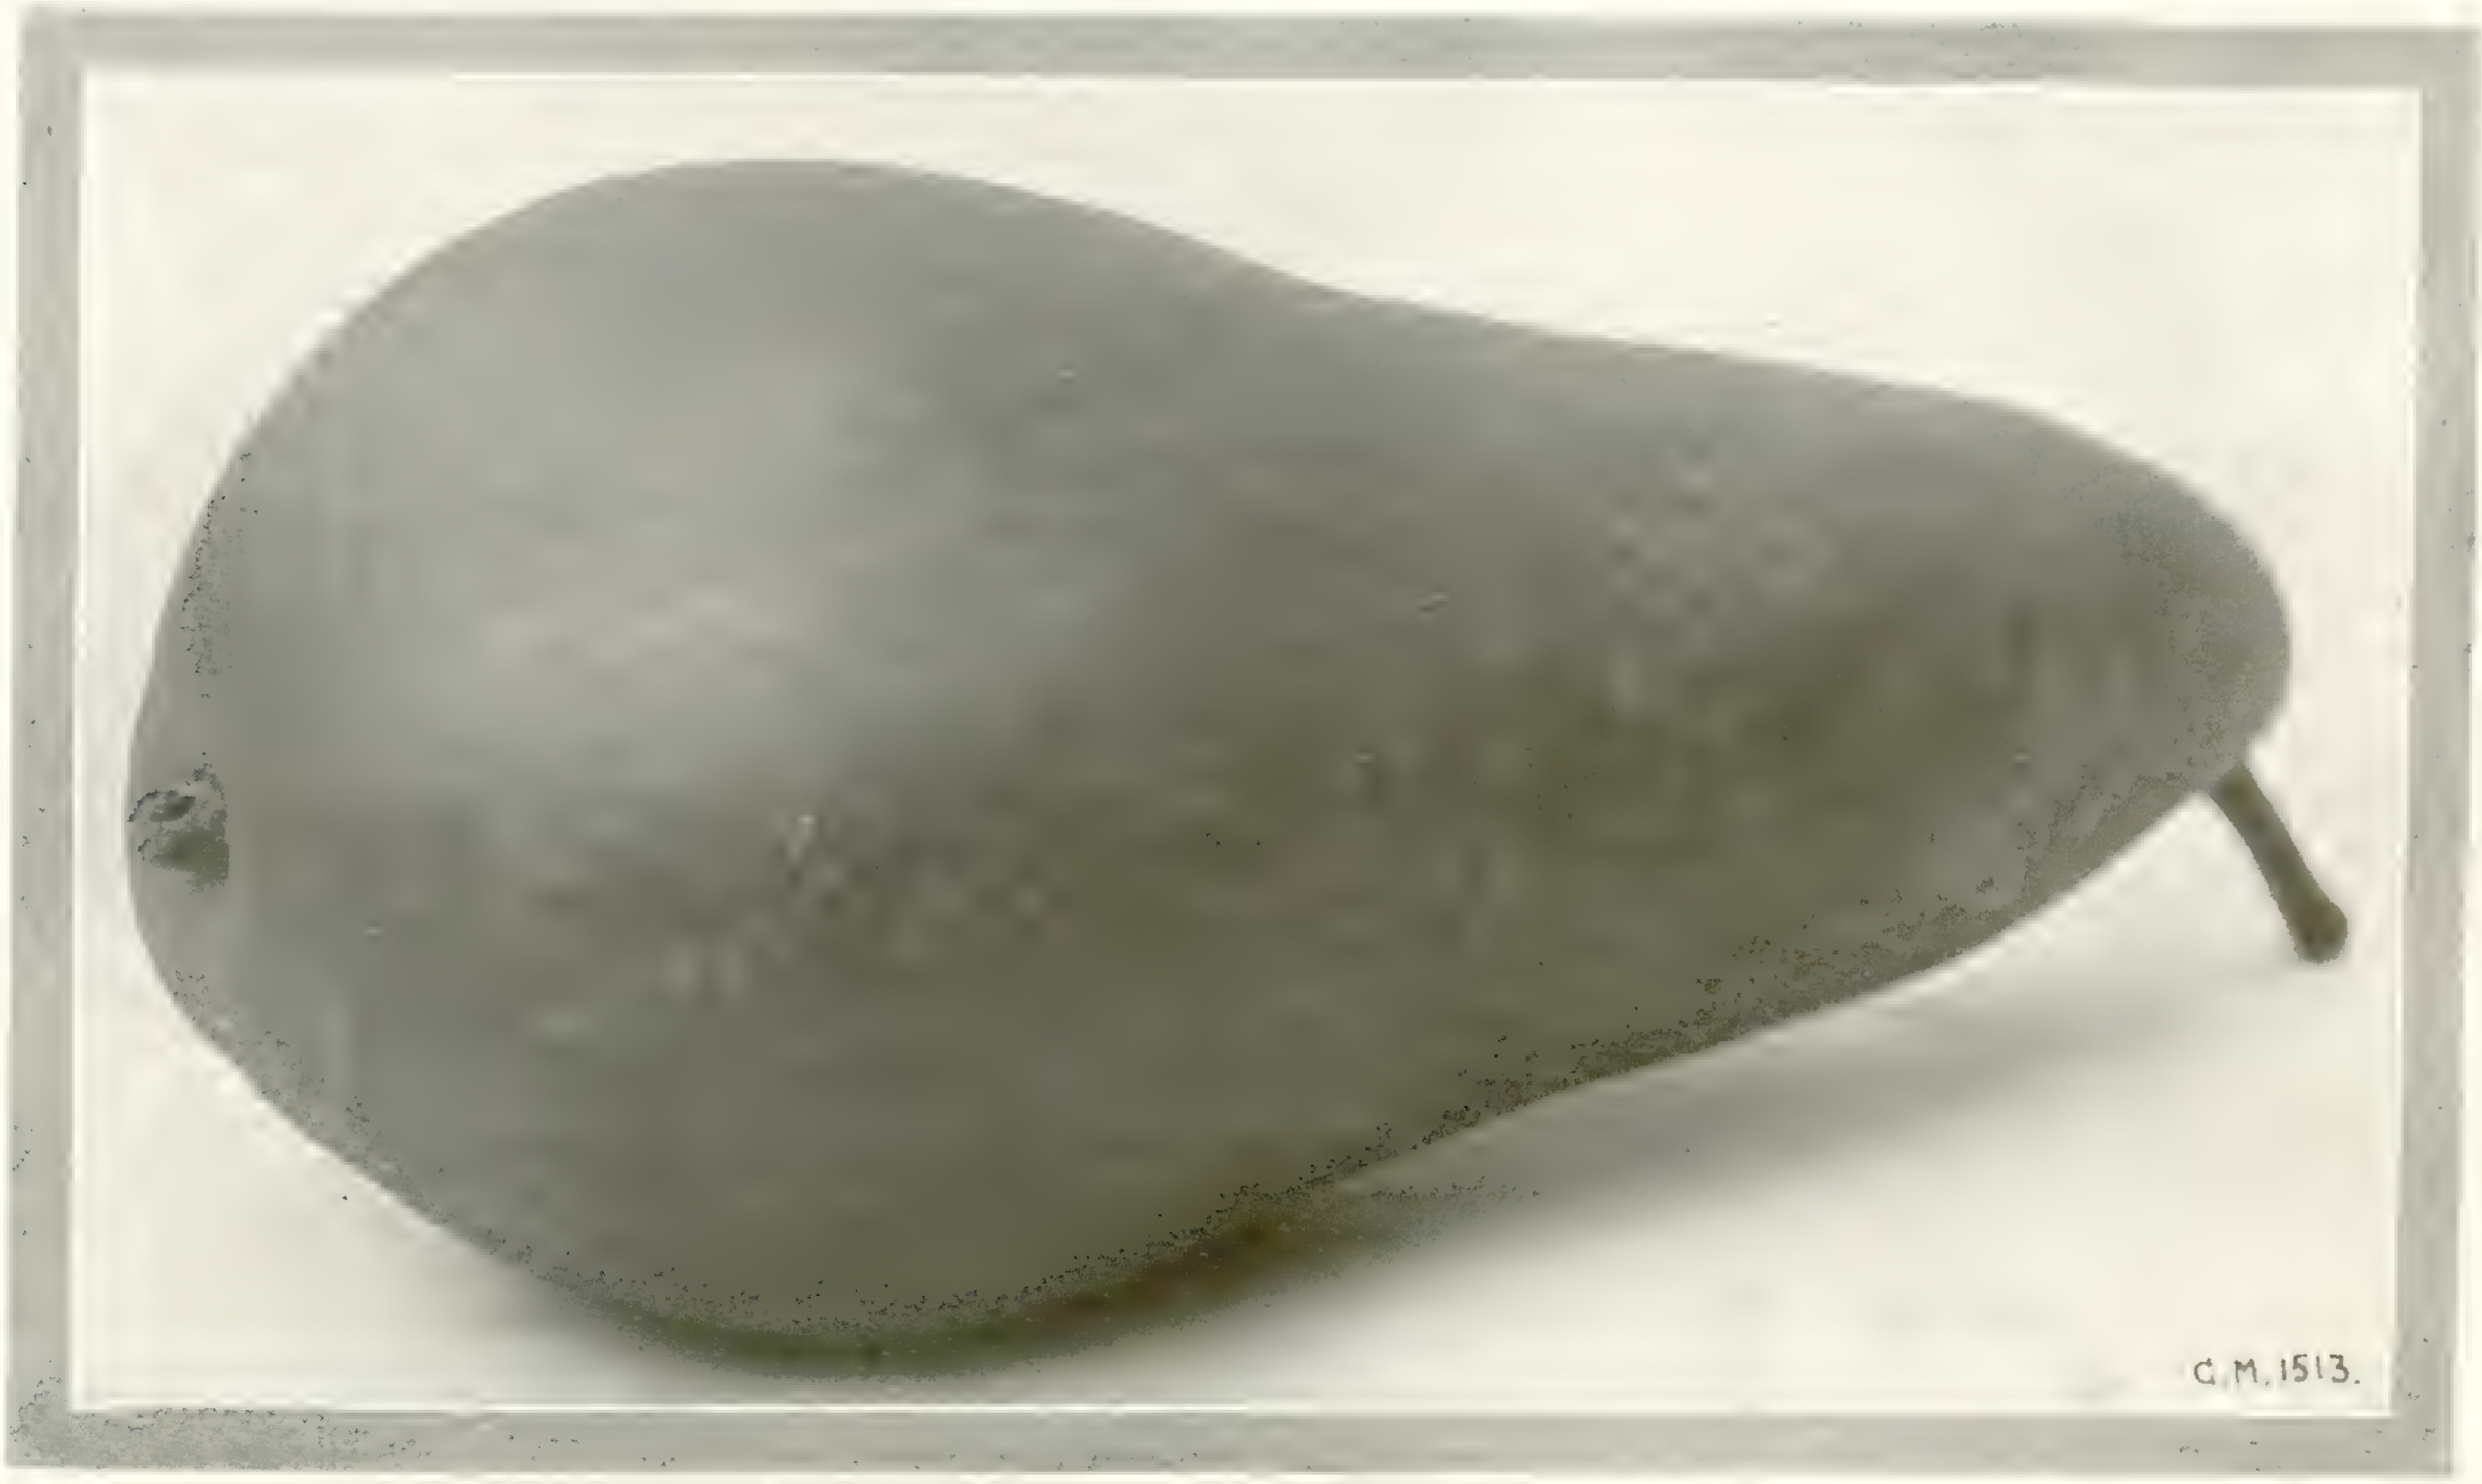
TWO GOOD AUTUMN PEARS.

◆

Conference.

This fine, comparatively new pear is easily distinguishable from the ordinary types by its extremely elegant shape, as the accompanying illustration so admirably depicts. It was raised by Messrs. Rivers and Son, of Sawbridgeworth, to whom we owe so many valuable hardy fruits. I do not know the date of its introduction, but as it was not exhibited at the National Pear Conference of 1885, and we planted it in 1903, it may be concluded that it was first distributed sometime between these two years. Though ignorant of its parentage, its characteristic resemblances in smoothness, colour, and russet to Marie Louise, leads me to think that old favourite was one of its parents.



PEAR CONFERENCE.

The fruits, which ripen in November, are, when well grown, large in size, and attractive in appearance, and richly flavoured, the flesh possessing a buttery texture. The variety in fact has the chief qualities required of a first-rate dessert and exhibition pear. It is also by some authorities said to be well suited for market purposes. Those, however, who do not know it may be assured of its good properties from the fact of its having been awarded a first-class certificate by the Fruit Committee of the Royal Horticultural Society.

The tree grows well, and bears freely when trained in any of the ordinary forms usually adopted in gardens and plantations. I have also seen fine pot trees of it carrying good crops of splendid fruit. It should be stated, however, that, according to my experience with trees upon the quince stock, planted on heavy cold soil, it is necessary, in order to secure cordons properly furnished with spurs, the trees should, while being formed, have the leading shoots closely shortened at pruning time. It is certainly necessary to cut them back more closely than in the case of such naturally free spur-producing varieties as Louise Bonne of Jersey. Unless this is done the basal buds may fail to break, and the permanent disfigurement of the tree will become a natural consequence. In warmer and otherwise more favourable soils than ours to the ripening of the wood and the production of good feeding roots, this precaution may not be to the same extent desirable.

Louise Bonne of Jersey.

Though this old variety ripens in October or November, when a goodly number of pears attain maturity, and amongst them some new ones of great excellence, it is, owing to possessing to the fullest degree the several qualities that are essential to a fruit being classed as first rate, fully entitled to the general popularity it holds. In appearance, when it is well grown, it is extremely handsome, being large, pyriform in shape, with an even and straw-coloured skin, overspread and spotted with crimson on the side exposed to the sun, while its flesh is white, melting, juicy, and highly flavoured. I well recollect the grand fruits I saw of it growing in Suffolk, where, as in Norfolk, the natural conditions appear to be admirably suited to the pear. At any rate, when assisted by skilful management, the Suffolk and Norfolk growers produce some of the finest examples of Louise Bonne of Jersey anywhere to be found in the kingdom. The tree forms a good pyramid, although the branches, not being so rigid as are those of some other varieties, when they are well laden with fully developed fruit, often need support to prevent the tree becoming badly shaped. It also makes excellent trained specimens of any form, while treated as a cordon when grown on the quince stock, it is perfect, clothing itself plentifully with fruit-bearing spurs with but little assistance. In favourable situations it also succeeds as a standard. I have seen instances of these carrying heavy crops of highly-coloured medium-sized fruits. In constitution the tree is not very robust; particularly is this the case when grown upon heavy soil, such as we have here, where it is found to be somewhat weakly when compared with such varieties as Emile d'Heyst, Beurre Hardy, or Marie Louise. There is, all the same, no need of condemnation from this reason. As a cropper this pear is one of the best, and quite young trees, if allowed to do it, may ruin themselves by this means. So free, indeed, is this variety in cropping that, in some instances, even in the case of well-nourished established trees, unless the fruit is severely thinned, serious consequences follow, as, apart from the fact of the unthinned fruit being small, and otherwise inferior, the tree is liable—I have seen it happen—to be permanently injured from exhaustion. As is the case with many others, the season may be prolonged by the fruit being gathered at short intervals. It is a most valuable pear for the gardens of amateurs.

T. Coomber.

Aralia spinosa.—This is well worthy of consideration, for the striking appearance of its large compound leaves, which give it a bold, sub-tropical appearance throughout the summer months. In early autumn the large erect panicles of small creamy-white flowers are freely borne, and it is then additionally attractive. The stems are very spiny. This aralia is a native of the United States, and is said to have been introduced into this country as long ago as 1688. It is nearly related to a Chinese species named Aralia chinensis, better known in gardens as Dimorphanthus mandchuricus. Of this there are two forms; one, in which the leaves are variegated with white, and the other with yellow.—W. T.

White Heather.—There is a deal of sentiment attached to the white heather, and a wide-spread idea that it is rare and valuable. As a matter of fact, there are several varieties of the common heather with pure white blossoms, differing from each other in habit, and other particulars. One of the best is Calluna vulgaris Searlei, of a fairly bold, free habit of growth; alba pilosa is a curious hairy-leaved form; and alba, an exact counterpart of the common heather, but with pure white blossoms; and rigida, a spreading variety with fine spikes of blossoms. It is interesting to remember that, at the time of King Edward's death, the South African Erica persoluta alba was used as white heather for wreaths.—W. T.

NOVELTY AND ELEGANCE AT CHRYSANTHEMUM EXHIBITIONS.

When reading the report of the recent Windsor Show in the Gardeners' Magazine, I was very pleased to see the special notice taken of the excellent groups of singles there displayed. They were far and away the best groups of single varieties I have seen anywhere, the whole five exhibits well meriting a prize, and I am sure the judges must have had a pretty severe task in adjudicating between the first and second prize winners. The schedule did not stipulate single varieties, but in each instance the groups were almost entirely composed of these, and a grand show they made, one or two groups towering up to a height of from ten to twelve feet.

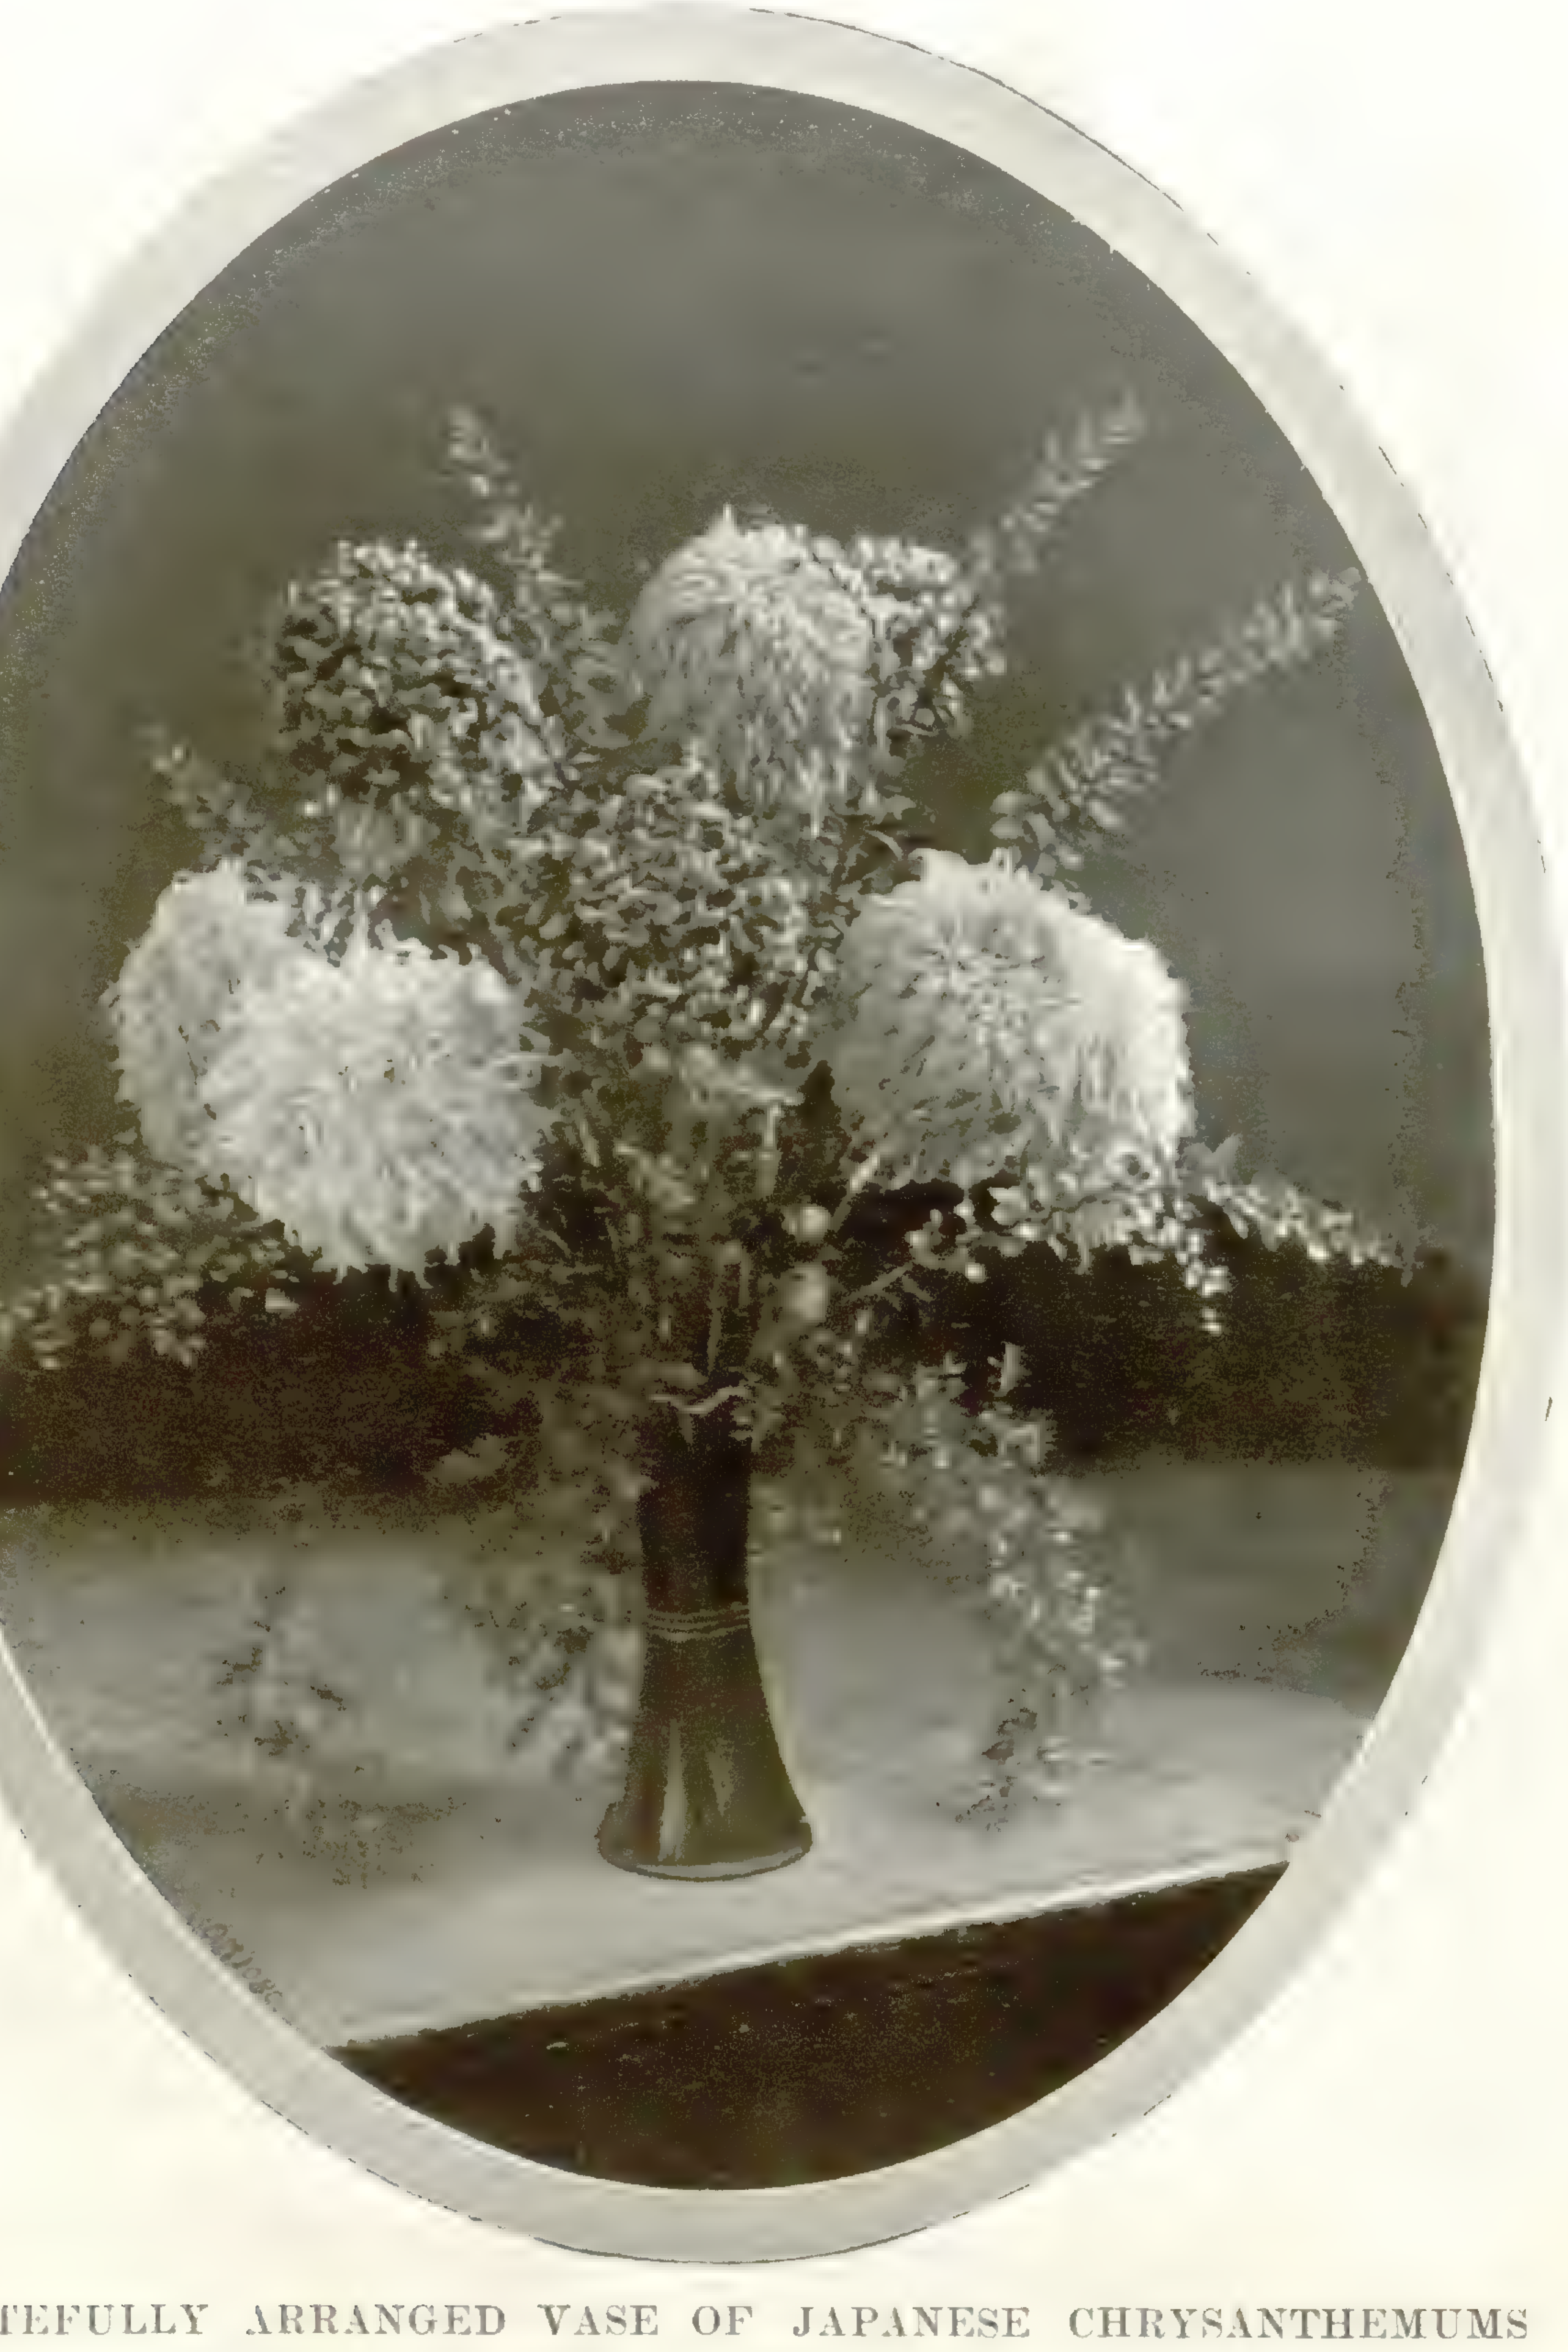
Now, good as these groups were, I cannot help but think they might have been improved very much if a few really high-quality Japanese blooms (on single stems) had been introduced among the singles, or ought I to say, a few single or decorative varieties should have been introduced among the Japanese, to break up what is generally a very severe outline? I am sure that were committees to word their schedules so that exhibitors could please themselves more as to the class of flowers they put in groups, and stipulate the maximum number of points that will be allowed for quality, and how many for arrangement and effect, it would tend towards a much larger entry in these group classes.

Unfortunately, most societies have none too large a subscription list, hence the paucity of the prizes offered in many of the group classes, but, taking into consideration the amount of space that groups occupy, and (when well set up) the splendid show they make, every endeavour should be made to give good prizes. I hardly think, however, that challenge cups are productive of as much competition as they are given credit for. Many gardeners who have the privilege of exhibiting often pay their own expenses, and a challenge cup, if won, does not help to pay the cartage bill, which, in the case of groups, is very considerable, so that a good money prize would be more acceptable in this case.

Harking back to the Windsor Show, I cannot help but pay a compliment to the executive for the really interesting exhibition they obtain, one or two of the classes in their schedule being quite unique, notably, Class 3: "Eighteen Japanese blooms, distinct, arranged in a space five feet by three feet, with the addition of any foliage plants or foliage, and in any way the exhibitor may please; exhibition boards not allowed; quality of bloom to be the leading feature"; and also Class 6: "A basket or vase of twelve cut chrysanthemums, with stems not less than twelve inches, any natural foliage allowed."

These two classes never fail to produce good competition, and they result in a much better show than the same number of blooms would if exhibited in the ordinary way on boards. I am sure many other societies, including the National Chrysanthemum Society, might institute similar classes with much advantage, as they fully demonstrate the decorative value of large exhibition blooms.

Thomas Stevenson.



A TASTEFULLY ARRANGED VASE OF JAPANESE CHRYSANTHEMUMS
Exhibited at the Windsor Chrysanthemum Show.

SOME GOOD RED BEDDING ROSES.

As a flower suitable for bedding and massing the rose is rising in popularity year by year. There was a time, not so very long ago, when the rose was regarded more or less as a specimen plant; be it standard or bush, we procured one, or perhaps two, of a sort, and planted them in borders with other flowers, and sought for excellence in form, size, and colour of the individual flower. We wanted quality, not quantity, and we found what we wanted in the hybrid perpetual. But compared with the modern rose, the true hybrid perpetual has but a short season, the designation "perpetual" simply denoting that, in contrast to the damask from which it sprang, the hybrid perpetual had more than one crop of flowers, not a continuity of flowering from June to October. The hybrid perpetual produced first-rate flowers in its first crop, but the second blooms were only second rate, mere echoes of the first. Ripening set in early; some varieties began ripening at the end of July if the season was dry, and then all was over.

But the coming in of the hybrid tea has changed all this. We found in it the hardiness of the hybrid perpetual combined with the activity of the tea, and, moreover, we found also that the second, and even the third crop of flowers was just as good, and sometimes better, than the first. Nevertheless, the suitability of the hybrid tea rose for bedding purposes was not immediately recognised, and for this reason the hybrid teas, when first introduced, lacked qualities demanded of bedding plants, compactness of growth, floriferousness, and brilliancy.

We had this brilliancy in the hybrid perpetual, such as Horace Vernet, Alfred K Williams, Charles Lefebvre, Duke of Edinburgh, and the like, but we sought for it in vain in the hybrid tea. Year after year new hybrid teas were introduced, first-rate varieties some of them as regards form, but in colour they were no substitutes for the hybrid perpetuals. It was the teas that suffered. We no longer cultivated them to the same extent as heretofore, when it was found we could get the same shade of colour in the hybrid teas. So time progressed, and we longed for some good red hybrid teas to take the place of hybrid perpetuals. Demand created supply; slowly, but surely, red hybrid teas are advancing, and, as a result, the hybrid perpetual is waning in popularity. It is not within the scope of this paper to refer to the new roses, except to observe there are now evident signs that before very long we shall have all we want in reds in the hybrid teas. One by one we have had to bid farewell to old favourites of the hybrid perpetuals, few now remain, and these will eventually become memories of the past. The dawn of the twentieth century witnesses the fading of the hybrid perpetual.

And in the class of hybrid teas such reds, such free-flowering reds, such brilliant reds, have come, and are still coming. Varieties, not perhaps up to exhibition standard, but what are far more in demand, fulfilling all the requirements of a bedding flower, compactness of habit, floriferousness, and brilliancy. Experts, specialists may appreciate yellow roses, but the colour in popular favour is red. Clearly then in any grouping of beds of roses on the lawn, especially if roses are to be substituted for geraniums, we must have some good reds.

Granted, but what shall they be? If we look through a catalogue we shall find many reds that might suit our purposes; let us select half-a-dozen of the very best. They are not novelties of this or last season cut from maiden plants, nor those seen only at the early shows grown under glass, but well tested varieties of some few years standing, all twentieth century roses, named, in the writer's opinion, in the order of merit: General McArthur, Chateau de Clos Vougeot, Ecarlate, George C. Waud, Warrior, Richmond.

General McArthur, H.T. (Hill, 1905).—A rose of American origin. Very attractive. Colour, bright scarlet. Flowers large and full, flat when fully expanded, freely produced on stiff upright stems, growing about twelve to eighteen inches high, compact. Very free flowering, constantly in bloom, good in autumn. Dark green leathery foliage. Very hardy, and a good bedder.

Chateau de Clos Vougeot, H.T. (Pernet-Ducher, 1908).—Colour velvet crimson, sometimes scarlet. Flowers of moderate size, buds pointed, expanded blooms cupped shape with deep yellow stamens. Very fragrant, and continually in flower. Wood and foliage pale green. Growth dwarf and spreading. The darkest red of all the hybrid teas, the flowers retaining their brilliancy in sunshine and rain. In habit it resembles a China rose. For massing, plant close together.

Ecarlate, H.T. (Boytard, 1907).—This rose will supersede that prey to and distributer of mildew, Marquise de Salisbury, which it closely resembles in habit and form of flower. In colour the blooms are brilliant scarlet, produced in bunches on upright stems, of medium size, and semi-double. One of the most suitable for massing, as it is constantly in bloom until late in autumn, and the colour is dazzling when at its best.

George C. Waud, H.T. (A. Dickson and Sons, 1908).—A most attractive rose on account of its colouring, crimson-orange. It seems to assert itself, for visitors notice it at once, and enquire as to its name. Truly it is a veritable "Top Dog" amongst reds. The flowers are pointed and full, after the style of the Newtownards roses. Habit is strong, but not too strong for grouping on lawns. Although active in growth, it bears but one or two blooms on a stem, and, therefore, a mass of flowers like General McArthur or Ecarlate is not to be expected. Nevertheless, its distinctive colouring, free flowering, and late blooming habit makes it suitable for bedding purposes.

Warrior, H.T. (W. Paul and Son, 1906).—In this rose we have a variety eminently adapted for bedding and massing. The flowers, of medium size, are dark red in bud, opening out scarlet-crimson. It blooms constantly, with great freedom, and is a good autumnal.

Richmond, H.T. (Hill, 1905).—An improved Liberty, retaining its colour better, and of stronger constitution. The flowers are perfect in shape, pointed. Habit of growth, upright. It is so well known on account of its excellent forcing qualities that no further comment is necessary, except to recommend it as suitable for bedding.

Joseph H. Pemberton.

FLOWERING SHRUBS FOR GROUPING.

With the present-day aim to increase the interest, beauty, and utility of our gardens, the old-time plants, such as laurels, aucubas, and cupressus are giving place to the more showy, more varied, and decidedly more useful of the flowering shrubs. These, too, instead of being planted singly, as in the old days, are grouped in masses of a size proportionate to the distance they are placed from the point of observation which they are intended to enhance. The farther they are from the point of view the larger the groups should be, and vice versa. In some instances twenty or more plants of the same variety will not be too many to plant, four feet apart, to form an isolated mass or a group in a border. The nearer the house, or the point from which the effect is desired, we approach, there should be a corresponding diminution in the number of plants employed to form the groups. In no case would I advise less than five plants where there is room for variety.

AN EFFECTIVE GROUP OF SINGLE CHRYSANTHEMUMS,
Exhibited at the Windsor Chrysanthemum Show.

Again, there are some flowering shrubs possessing so little merit, when we compare them with the better things, that a selection is desirable if the best results are to be obtained. The finer subjects naturally cost a little more than the more common and less showy ones, but this is the only difference, as inferior and good kinds cost the same to cultivate, and the extra expenditure in the first instance is more than compensated by the display and quality of bloom. There are, of course, a few really good free-flowering plants among the cheaper ones that should find a place in almost every collection. Spiræa ariæfolia and Ribes sanguineum, and its varieties, are all worthy subjects for brightening shrubbery borders. Besides being an effective plant for early spring, the ribes succeed well in partial shade as well as in the sun.

The following flowering shrubs may be relied upon to give a good display of colour at their time of flowering:

Evergreens.

Berberis Darwini, B. dulcis, B. stenophylla, Buddleia variabilis Veitchi (in a warm corner), B. v. magnifica (warm corner), Ceanothus azureus Gloire de Versailles, C. Albert Pettit, C. Veitchianus, C. divaricatus (all for warm situations), Choisya ternata, Cistus ladaniferus, Cytisus albus, C. scoparius Andreanus, Escallonia Langleyensis (excellent for covering banks), Genista præcox, Ligustrum japonicum, Olearia Haasti, Spartium junceum, Tamarix hispida æstivalis, veronicas (in mild localities), Viburnum tinus (laurustinus), and rhododendrons.

Deciduous.

Berberis Thunbergi, B. vulgaris, Deutzia crenata candidissima fl.-pl., Forsythia suspensa, Hydrangea paniculata grandiflora, Indigofera Gerardiana, Mespilus canadensis, Philadelphus Gordonianus, P. grandiflorus, Prunus sinensis alba fl.-pl., P. s. rosea fl.-pl., Ribes sanguineum and its varieties, Spiræa ariæfolia, S. media, S. Anthony Waterer, Viburnum plicatum, V opulus sterilis, Weigela rosea, W. nivea, W. Eva Rathke, and azaleas.

Rhododendrons and azaleas do not succeed on a calcareous soil. With the exception of the philadelphus, Berberis vulgaris, and ceanothus, all the plants in the above list are suitable for groups along the margin of a shrubbery, or as isolated masses. The philadelphus, ceanothus, and Berberis vulgaris should be in the second row of groups.

I might have included lilacs in this list, but conclude that they are sufficiently well known not to need any comment, as they are so extensively forced, otherwise groups of these along with philadelphuses and Berberis vulgaris should be included for the second row of groups. Hydrangea paniculata grandiflora is the only species amongst them that must be pruned. The best time to do this is early spring, and then plants should be cut back to within an inch of the base of the previous year's growth. All the shrubs mentioned will grow freely in an ordinary fertile loam, and, in the case of the more tender plants (including ceanothus), and the weigelas, much manure is undesirable. PEDESTRIAN.

PLUM EARLY PROLIFIC.

In nearly every garden there is a warm corner capable of accommodating one or more fruit trees. But I wish to refer chiefly to the small corners or spaces usually allowed to remain unoccupied by fruit or other trees. Such spaces are favourable for the above-named plum, and I am sure those who have not had any experience of it will be pleased if they plant young trees now.

I had some vacant wall spaces between a number of young pear, apricot, and plum trees on a very high wall, and decided to put in several young trees of Early Prolific plum, so as to utilise, for a time, the valuable wall space. Well, this variety cropped so well, and so early, and year after year, that I was very sorry to have to remove them.

In all gardens this is a good plum to plant, and it is especially suitable for small gardens. I have not tried it as a bush, but I daresay it would make a good companion to Victoria. G. B.

Chironia linoides.—Under the name of Chironia ixifera, this South African gentianwort has been of late years extensively met with. Grown in pots five inches in diameter it forms rather upright, compact little bushes, clothed somewhat sparingly with narrow bluish-green leaves. The flowers, borne freely at the points of the shoots, are of a pleasing pink colour, with conspicuous yellow anthers. Where a greenhouse has to be kept gay at all seasons this chironia will be valued for its display during late summer and early autumn.—W. T.

MODERN COMMERCIAL FRUIT CULTURE.

So much still appears, and has been appearing for some time, in the columns of the Press, especially in the weekly and daily newspapers, concerning fruit growing and the big fortunes to be made at it, that it has seemed to me about time some grower who has actually grown fruit for a living, and experienced some of the difficulties and drawbacks attending commercial fruit growing, should place before the gardening public, at any rate an account of the situation as it really is.

Many of the writers of such articles and paragraphs are men who have never done a day's work with a spade, fork, hoe, or any other gardening tool in their lives, and do not know what it is to follow their forefather Adam and earn their bread by the sweat of their brows. Their favourite practice is to take a fruit tree, or a small block of fruit trees, estimate the produce upon them, always as first grade fruits, calculate the value at best retail prices, and then proceed to work it out at per acre, as if all the plantation was absolutely regular, all the crop was of the finest size, and all sold at the highest retail price, without any losses whatever. Of course, examined critically, such reasoning is false in the extreme, yet such tales go down with the ordinary public, until a fruit grower comes to be regarded as a sort of modern Crœsus, who is piling up wealth at a very great rate. I would like to go into a few of the things which a modern grower has to contend with, and the first, and one of the most serious, is

Unsuitable Situations.

There is many and many a fruit grower who is struggling year by year to make a bare living almost the whole of whose troubles can be attributed to this cause. The soil may not be at all adapted for fruit culture, the land may "lay" wrong, that is, the tilt of the ground may be to the north or east, instead of the south or west, or the elevation may be at fault, the orchards may be in low land, where they are liable to any spring frosts which may be about. I am inclined to think that the latter is not nearly so serious a drawback as it was before the advent of the orchard heaters for fighting spring frosts, and that with their aid it is preferable to be situated in a valley, on good deep soil, than on a bleak hillside, with a thin staple, and exposed to all the cold spring winds.

The season of 1910, to a large extent, bears out what I have just said, it is my opinion, though I admit I took no records. We did not have any exceptionally severe spring frosts, but what we did have was a long continuance of cold winds, this time out of the west, and, as far as I can learn, it has been those growers who were in the valleys and in sheltered positions who have had the good crops, in contradistinction to those on the high exposed places. Further, I have found that all the best of our crops have been in the older, thicker plantations, and not on the younger trees, where their power to mutually shelter each other was not so great.

However, above all considerations of situation and elevation, the question of soil is the all important one, and there are many places where an absolutely hopeless struggle is being maintained, solely because the soil is not, and can never be made, suitable for the class of culture in hand. For one parcel of good fruit land in the country there are hundreds of bad ones, yet the innocent reader is never informed of this fact, but is led to believe that it is only necessary to get a field of any kind and plant it with fruit trees to be straightway in possession of an Eldorado.

Of course, many fruit orchards, the soils of which are now unsatisfactory, could be much improved by proper means: some, no doubt, need draining, the trees having been planted without any thought being given to the condition of the drains, or whether there were any; in others, the soil is acid, and badly needs the application of a dressing or two of lime, which would probably save much money now being spent on spraying by putting the trees into such a healthy condition as to ward off disease. Such difficulties are fairly easily overcome, but the more serious difficulty of the mechanical condition, if I may so call it, of the soil, is not so easily dealt with; indeed, it can only be surmounted practically by growing such fruits as will thrive properly in the medium one has at one's disposal; just one or two favoured soils will grow anything. Handicapped by an unkind soil, one must grow that which will do best upon it. Some of the worst lands, so far as orchard trees are concerned, are those with a thin layer of decent loam overlying cold clay subsoil, or even gravel or rock, though the case is not so serious in the last two. The trees do well for a time while in the good soil, but as soon as they begin to go down into the cold clay underneath all sorts of troubles begin: canker starts in all varieties the least subject to it, the general unhealthiness of the trees renders them an easy prey to all fungoid and insect pests, and so they rapidly deteriorate. I really believe that a thoroughly heavy stiff clay soil is far preferable to one of these thin-capped soils overlying the clay. On such soils strawberries and small fruits could be grown, and perhaps apples on the paradise stock, if particular care was taken to keep the roots as near the surface as possible.

It may be urged that there is plenty of suitable land for fruit growing, and there is no need to choose the bad; to a small extent this may be the case for one about to start, but many of us are on established places, and are now suffering for our own mistakes in earlier years, or for the mistakes of those who preceded us. Again, someone plants fruit in a new district, and happens to get a piece of ground which is suitable: in many cases his example is followed by the adjoining holders, though often their soil may be just as unsuited for fruit culture as the first was good. The same thing sometimes happens to one in extending one's own orchards. The natural extension of business may force one to plant fresh acreage, yet any available land within easy reach may be very unsuitable indeed.

Even if one can find a piece of suitable land for fruit growing, it is often difficult to obtain possession for the purpose, except by purchasing the freehold. Many landlords are so afraid of the compensation they may be called upon to pay some day if they allow fruit to be planted, that they absolutely refuse to let their land for the purpose at all.

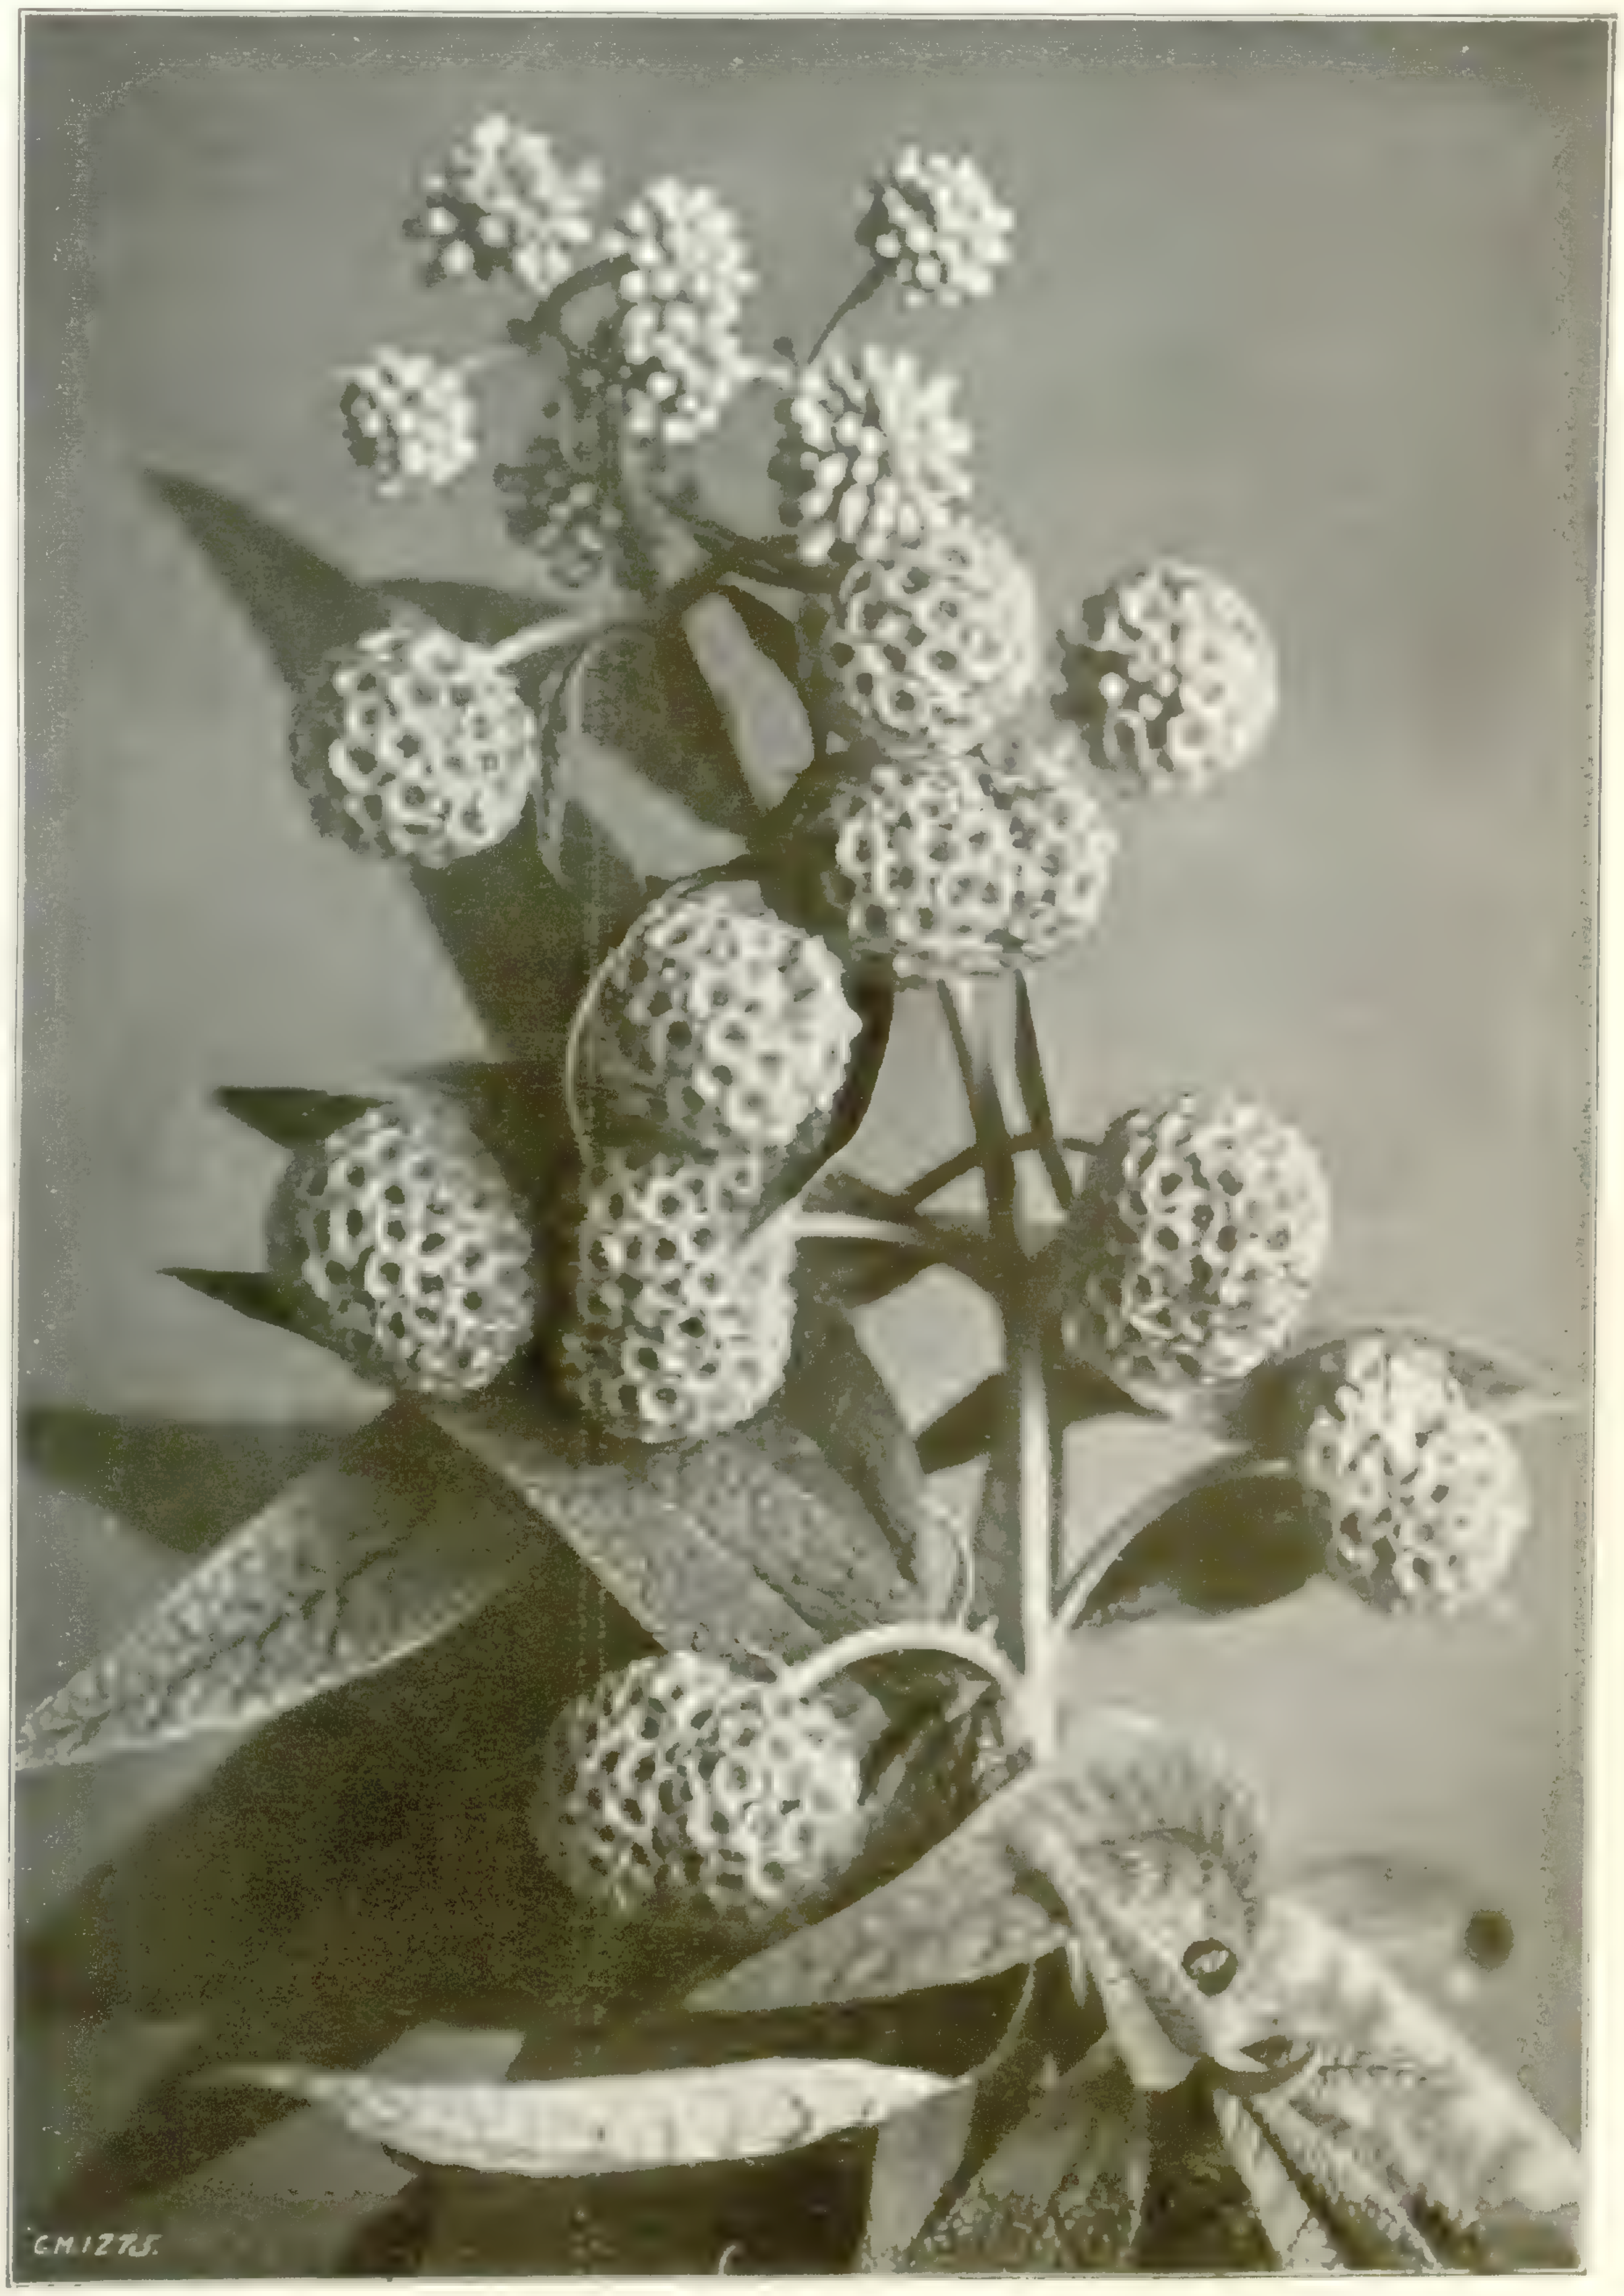
I do not think any good purpose will be served in labouring the point, but, to my mind, there is absolutely no doubt that a good deal of the trouble many growers are in with regard to the unhealthy state of their trees is due to the unsuitable soil in which they are planted.

FRANK HAMMOND.

(To be continued.)

BUDDLEIA GLOBOSA.

The introduction of Buddleia variabilis and its several varieties has caused this old, well-known species to be somewhat neglected of late years. At one time it occupied the proud position of being the hardiest known species, whilst its floriferous character made it a favourite for shrubbery planting. There is really no reason, however, why the cultivation of the newer kinds should have a depreciatory effect on the older plant, for the flowers are borne at a different time, and the inflorescence is totally distinct. B. globosa is found in Chili and Peru, and under cultivation it forms a large bush up to 15 feet in height. The leaves are semi-evergreen, and are retained through mild winters. The golden, tubular flowers are borne in round heads, a large number of which form a rather loose terminal panicle. They appear during June and July, and are conspicuous alike on account of their golden colour and honey-like fragrance. As is the case with the Chinese species, bees are very fond of the flowers, and from a large bush scores of the insects may be disturbed by a light shake. Though this Buddleia will grow in quite light soil, more satisfactory results are gained from plants growing in good loam. Occasionally a very severe winter may cut a shrub hard back, but it will usually produce young shoots from the ground line. Should a specimen be growing wild, it may be shaped in spring by drawing out some of the rampant shoots; on no account, however, ought bushes to be hard or stiffly pruned, for the charm of this buddleia lies in its naturally free habit. Cuttings may be rooted in July and August, or young plants may be produced from seeds which set freely and ripen perfectly. W. D.



BUDDLEIA GLOBOSA.

A handsome South American shrub bearing orange-coloured flowers.

THE CAPE FIGWORT.

A large number of plants of considerable beauty are not so hardy in many parts of the country as to be commonly met with, and Phygelius capensis, the Cape Figwort, must be included in the class of such flowers. It is a pretty, and also a distinct plant, quite showy, and valuable in both summer and autumn when it is in flower. The leaves are rather oval in form, and the flowers, which are borne plentifully, are drooping and of a fine vermilion colour, yellow in the throat, and rather cornucopia-like in their form. The whole plant is distinct from all other flowers of the season in which it blooms, and is a nice ornament to the garden. A slight lack of hardiness is the sole obstacle to the more general cultivation of this plant, which grows from one and a-half to about three feet in height in most places, but which the writer has had considerably taller, when it assumed a shrub-like habit in a garden near the sea. There it was not only taller, but, when planted on rockwork, it sent out a number of suckers among the stones. It thrives best in a warm situation, and in a mild district, but is wonderfully accommodating in some parts, and from some obscure cause even will flourish in certain cold parts of the country, while in others which are milder it will die out. It likes a dry soil, and is probably best against a wall in cold districts.

In some places it dies to the ground annually, but in others, as indicated, it assumes a shrubby character, and sends fresh growths from the old stems in spring. It is propagated by rooted suckers or by cuttings, which strike quite readily in pots of sandy soil under glass in spring, summer, or autumn. S. Arnott.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

WATERING.—One of the most essential items in the successful cultivation of orchids is to supply the necessary moisture in accordance with the requirements of the plants at the different seasons of the year. It is very important to supply water with care when the plants are at rest, or, in other words, when they are in a dormant condition. The fact cannot be overlooked that, when one has a mixed collection of orchids to be attended to, where not only is the accommodation for the plants restricted, but where labour is short, and attention has to be given to other matters, orchids cannot always receive the attention at the particular time they need it. Under such conditions the cultivator is considerably handicapped, and no small wonder, when we find that plants suffer at this season of the year perhaps more so than during the bright summer season. One finds it difficult even with a staff of skilled and willing workers to have the watering done as well as one would wish. It is frequently found that there is a considerable difference of opinion even among trained men as to when a plant is dry and requiring root moisture. Naturally, such a debatable point cannot easily be brushed aside and the work done haphazard. This does not apply to orchid growing more forcibly than to the treatment of other classes of plants. But there is one safe guide, and that is to water plants thoroughly when watering at this season of the year, and be careful not to water again before the compost has become reasonably dry. Again, with orchids we have plants differing materially in structure. Thus plants having large pseudo-bulbs will not require anything like the amount of root moisture that will be necessary to sustain those species which possess only tufted leaves and roots. Yet many of these widely differing kinds often have to be accommodated in the same structure. With the tufted kinds of orchids, such as cypripediums, masdevallias, etc., it is essential that when they require root moisture the potting compost should be well wetted through. If this is done there will be no danger of the surface of the potting compost appearing to be moist, while the portion containing the roots is quite dry.

TEMPERATURE.—With the changeable conditions outside the temperature of the house should be above the normal before watering is done. During periods of cold weather, and a consequent lowering of the temperature of the houses, I have always found that less injury is done when in a reasonably dry state at the roots. There is also the temperature of the rain water in the tanks to be considered. After heavy rains and snow storms, where the water runs straight to the tanks used, it will frequently be found that the water in the tanks will, for several days, be some degrees below the normal temperature of the houses. The water should be two or three degrees above the temperature, and hot water should be added to raise it to the desired degree of warmth.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

HERBACEOUS CALCEOLARIAS. — The most forward plants will have nearly filled their pots with roots, and should be shifted into pots of larger size, but this must not be done in very cold weather. A richer compost may be used for this shift, and it should contain a larger portion of sand. Repotting should not be done when the soil is dry, but when the compost is moderately moist, and the soil will not fall away.

CHRYSANTHEMUMS.—Cut down any of the plants on which the blooms have lost their freshness and beauty, and any that are required for furnishing cuttings should be removed to a light position, where, under careful attention, they will produce sturdy suckers. The prompt removal of these will provide room for many late-flowering varieties that are now coming into bloom. The latest plants should remain in a cool structure, where abundant ventilation can be employed when the outdoor conditions are favourable.

PRIMULA SINENSIS.—The plants now developing their flower trusses should have a temperature ranging from 50 degrees to 55 degrees, and also a little air when the temperature reaches the latter figure. If the plants are strong and healthy the trusses will rise well above the foliage, thus appearing to the best advantage

EARLY - FLOWERING GLADIOLI. — These are especially suitable for pot culture, and whether grown for use as pot plants in the conservatory or for cutting purposes, they are appreciated during the spring and early summer months. Procure the corms at once, and pot them up, using a compost consisting of two parts good turfy loam to one part of leaf-soil, and a little sharp sand. In the process of potting place a little sand immediately under each corm, and put from six to twelve corms in each pot, according to the size. Pots ranging from 4½ inches to six inches in diameter are large enough, The white variety of G. Colvillei, known as The Bride, is indispensable, and as the corms are moderate in price it should be grown in large quantities. Other good varieties for pots are Queen of Holland, Crimson Queen, Ne Plus Ultra, and Pink Perfection.

TRAINING OF PLANTS.—Winter is the best time for training plants into shape. Specimens are often seen at the exhibitions that are indifferently trained, and if exhibitors realised how many points they lose in competition in consequence they would give more attention to this detail of plant cultivation than is usually given. Much satisfaction may be derived from a well-grown specimen even when not in bloom. In growing soft-wooded subjects, such as fuchsias or pelargoniums, timely attention should be given to stopping at a very early stage, that the foundation may be well laid when they are quite young.—W. STAWARD, Preston Hall Gardens.

THE FLOWER GARDEN.

BEDDING PLANTS, such as pelargoniums that were lifted from the beds, are now starting into growth, consequently all the light available should be afforded them, as well as a temperature not exceeding 60 deg., if good cuttings are required for spring propagation. All kinds of stock bedding plants should be occasionally examined, carefully removing all decaying stems and foliage. Root moisture should be very sparingly given until the turn of the year and lengthening of the days, as losses are sure to occur from excessive root moisture, most of these subjects being very impatient of too much water at the roots at this dull time. Give abundance of air upon every possible occasion, and if accompanied by a little fire heat so much the better, for by these means damping will be most effectually prevented. Coleus, alternantheras, and kindred plants will, of course, require more fire heat, so that they may be kept steadily growing, and the temperature ought not to drop below 65 deg. if success is to be ensured.

ECHEVERIAS, CALCEOLARIAS, and the like, now wintering in cold frames, should be plentifully protected during very severe weather, for, although they will withstand a deal of frost at times, it is preferable that they do not go through the ordeal, and consequent risk.

HOLLIES AND CONIFERS, especially where growing on shallow soils, are frequently much benefited by surface dressings of suitable material at this time of the year; light turfy loam, roughly chopped up, with the addition of a small portion of well-decayed manure, is an excellent compost to use. If the trees are growing on lawns the turf should be rolled back, a portion of the surface soil carefully loosened and removed, and the dressing then applied. Much will, of course, depend on the condition and size of the trees to be treated, but under no consideration ought extreme risks to be run when dealing with choice trees and shrubs.

BERRIED TREES AND SHRUBS have been, and in some instances still are, giving a touch of colour to the shrubberies and borders, and the present is an excellent opportunity for marking sites where additions of this class of shrubs may be made for another season, and in this direction much taste and skill might be shown with little effort. Waste corners might be beautified and completely changed by the exercise of some skill, and become for a trifling outlay attractive and interesting features.

TURF EDGINGS AND VERGES under the dense shade of trees require to be frequently renewed if a smart appearance is to be maintained throughout the season; where this is so, an excellent remedy may be found by planting ivy in the form of edgings, or on bare patches under trees. The common Irish Ivy is an excellent variety for this purpose, and, although other choicer and showier kinds may be used, the former is usually the more satisfactory, being perfectly hardy, and adapted for rough treatment, which is of itself no small consideration.

TURFING DISCARDED BEDS may be proceeded with during favourable weather. Care should be taken that the surface be well rammed before laying down the turf, or hollows—which are always unsightly—will be visible all through the following season. Where a selection of turf can be made, that of a fine texture and quality should be secured, this giving altogether more pleasing results than turf of a coarser quality. Turves about 2ft. long by 9 or 10in. wide, and 1 to 1½ in. thick, are much more convenient for handling than those of a larger size.—W. HEDLEY WARREN, Aston Clinton Gardens.

HARDY FRUITS.

PRUNING PEACHES, NECTARINES, AND MORELLO CHERRIES.—As the same method is adopted for these three kinds of fruit trees, they can be dealt with under the one heading. Where the disbudding of the trees has been carried out in a proper manner, and a sufficient quantity of young shoots have been tied in, it will be only necessary to cut out the superfluous and useless growths; at the same time care must be exercised to thinly dispose the young growths, and this will probably necessitate the careful removal of some with a sharp knife. Strong-growing shoots should be shortened back, according to their strength and the ripeness of the wood, to assist in the building up of a well-balanced tree. Strict attention must be paid to the promotion of young growths from the centre or the base of the trees, and this is easily accomplished when careful pruning and disbudding in the spring months is carried out. Morello cherries are usually grown on a wall having a north aspect, and when pruning operations are finished the trees should be well washed with some approved insecticide, removing all ties or shreds before commencing this work. After the trees have been thoroughly cleansed, the main branches should first of all be carefully tied out at their proper angle, and the young growths tied securely, but loosely, in their proper places. I cannot emphasise too strongly the necessity of allowing plenty of room between the ligatures and the wood. When the pruning of the peach and nectarine is completed, the wood should be thoroughly cleaned in the same manner as that advised for cherries. Usually, these trees are grown upon a wall having a south or south-west aspect. Consequently, the proper training of them should be deferred for a few months later. Nevertheless, the branches and twigs should be tied up in loose bundles, and firmly secured a few inches away from the wall. This operation will not only have the beneficial effect of retarding the flowering period in the spring months, but it will also leave the walls exposed to the elements in winter, and will thus be the means of destroying many insect pests secreted thereon.

SPRAYING.—It is usually recommended that spraying operations should not take place until early in February, just before the buds begin to burst, but we have found it a good plan to spray our fruit trees at the present season and again in February, hence the necessity of urging that pruning operations be completed without delay, so that this work can be carried out. The trees must be well sprayed, taking care to thoroughly wet all the twigs and branches. Several winter washes can be purchased from reliable firms who make a speciality of these things.

GENERAL WORK.—If the weather continues open planting operations should be carried out without delay. If, on the other hand, frost continues, and pruning is finished, and the ground is cleaned up, advantage should be taken to wheel manure to a convenient spot in the fruit quarters, but this should on no account be spread upon the ground beneath the trees until all indications of frost have disappeared from the soil. — HENRY R. FARMER, Cardiff Castle Gardens.

CHRYSANTHEMUM PURITY.

This pure white-flowered variety has been very highly spoken of as an exhibition treasure. It will, undoubtedly, find favour with many cultivators on that account solely, but I am sure it will also become a favourite for decorations and the market. At one time we had the old white Elaine, but the flowers soon turned to a pale pink colour. Then we had Niveus, certainly better than Elaine, as regards keeping qualities, but it had one serious fault, namely, a weak flower stem. The variety Purity possesses every good point; the plant is easy to grow, has a fine dwarf, sturdy habit, every flower bud develops into a fine bloom, the latter is borne on a stout stem, and lasts fresh on the plant for quite a fortnight after the bloom is approaching full development, and then keeps its pure white colour for a week when cut and placed in vases.

For conservatory decoration, cut flowers, and market purposes, this variety will prove of great value from the latter part of November until nearly Christmas.

G. B.

BASIC SLAG.

This is one of the most useful of all artificial manures for garden soils, with the exception of those of a chalky nature, and light gravelly soils which have not been under garden cultivation long enough to have become rich in organic matter. Opinion as to its solubility has altered somewhat in recent years, for whereas it used to be held that scarcely any of the phosphate became immediately available when applied to the soil, and a considerable portion of it only very slowly indeed, it has now been proved by treating it with a solution of citric acid, to imitate the conditions to which it is exposed in the soil by the fermentation of the humus, and the acid of the root sap, that with the best samples much of the phosphate is almost immediately soluble, and the whole of it ultimately. One experiment showed, in fact, that after being subjected to a 2 per cent. citric acid solution for four hours 90 per cent. of the phosphate was dissolved.

Old garden soils which have become rich in humus as the result of many years of manuring are usually inclined to be sour, and on such soils basic slag acts more quickly than anywhere, while the lime in the slag, a small part of which exists in a free state, counteracts this acidity, and sweetens the soil, causing most plants to grow better, while it favours the development and activities of the soil germs upon which the supply of nitrate depends.

Nor is this all, for in any soil possessing an accumulation of manurial residues there is a great store of potash locked up, that is, it is not in an available condition for plants, and the lime of the basic slag has the effect of setting free the potash in a soluble condition, much to the advantage of plant growth. Anyone applying basic slag to such a soil for the first time will be astonished at the result, for as it supplies lime and phosphate, sets free potash, and by its sweetening of the soil hastens the breaking down of the humus into ammonia, etc., it may be considered as a complete manure in such circumstances, at least for the first time of use, and it need not be supplemented by any other manure, either animal or mineral.

As phosphorus is the principal agent in the formation of fruit buds, and as it hastens the development and maturing of these buds, as well as of the fruit, basic slag is one of the best manures that can be applied to fruit trees on heavy soils, especially when they are making luxuriant growth. When applied to lawns on such soils it produces good results, though the result of its use is often an astonishing development of clover, where it was not noticed before, it is not recommended for tennis lawns. Autumn and early winter are the best seasons in which to apply it, and the rate from four to six pounds to forty square yards, always sowing it thinly, either in the trenches as digging proceeds, or lightly hoeing or raking over the surface of the soil between successive sprinklings. If sown too thickly there is a risk of its caking together and setting when dry, so that the benefit of its fineness of grinding is lost.

There are various grades of basic slag, but the fineness of the grinding is of more importance than the content of phosphate, assuming that the price is proportionate to the analysis. A fair average sample should be guaranteed to contain a minimum of 35 per cent. of phosphate of lime, while 85 per cent. of it should pass through a sieve with 10,000 holes to the square inch. The best samples are guaranteed to contain a minimum of 42 per cent. of phosphate, of which 80 per cent. is guaranteed to be soluble in a 2 per cent. citric acid solution.

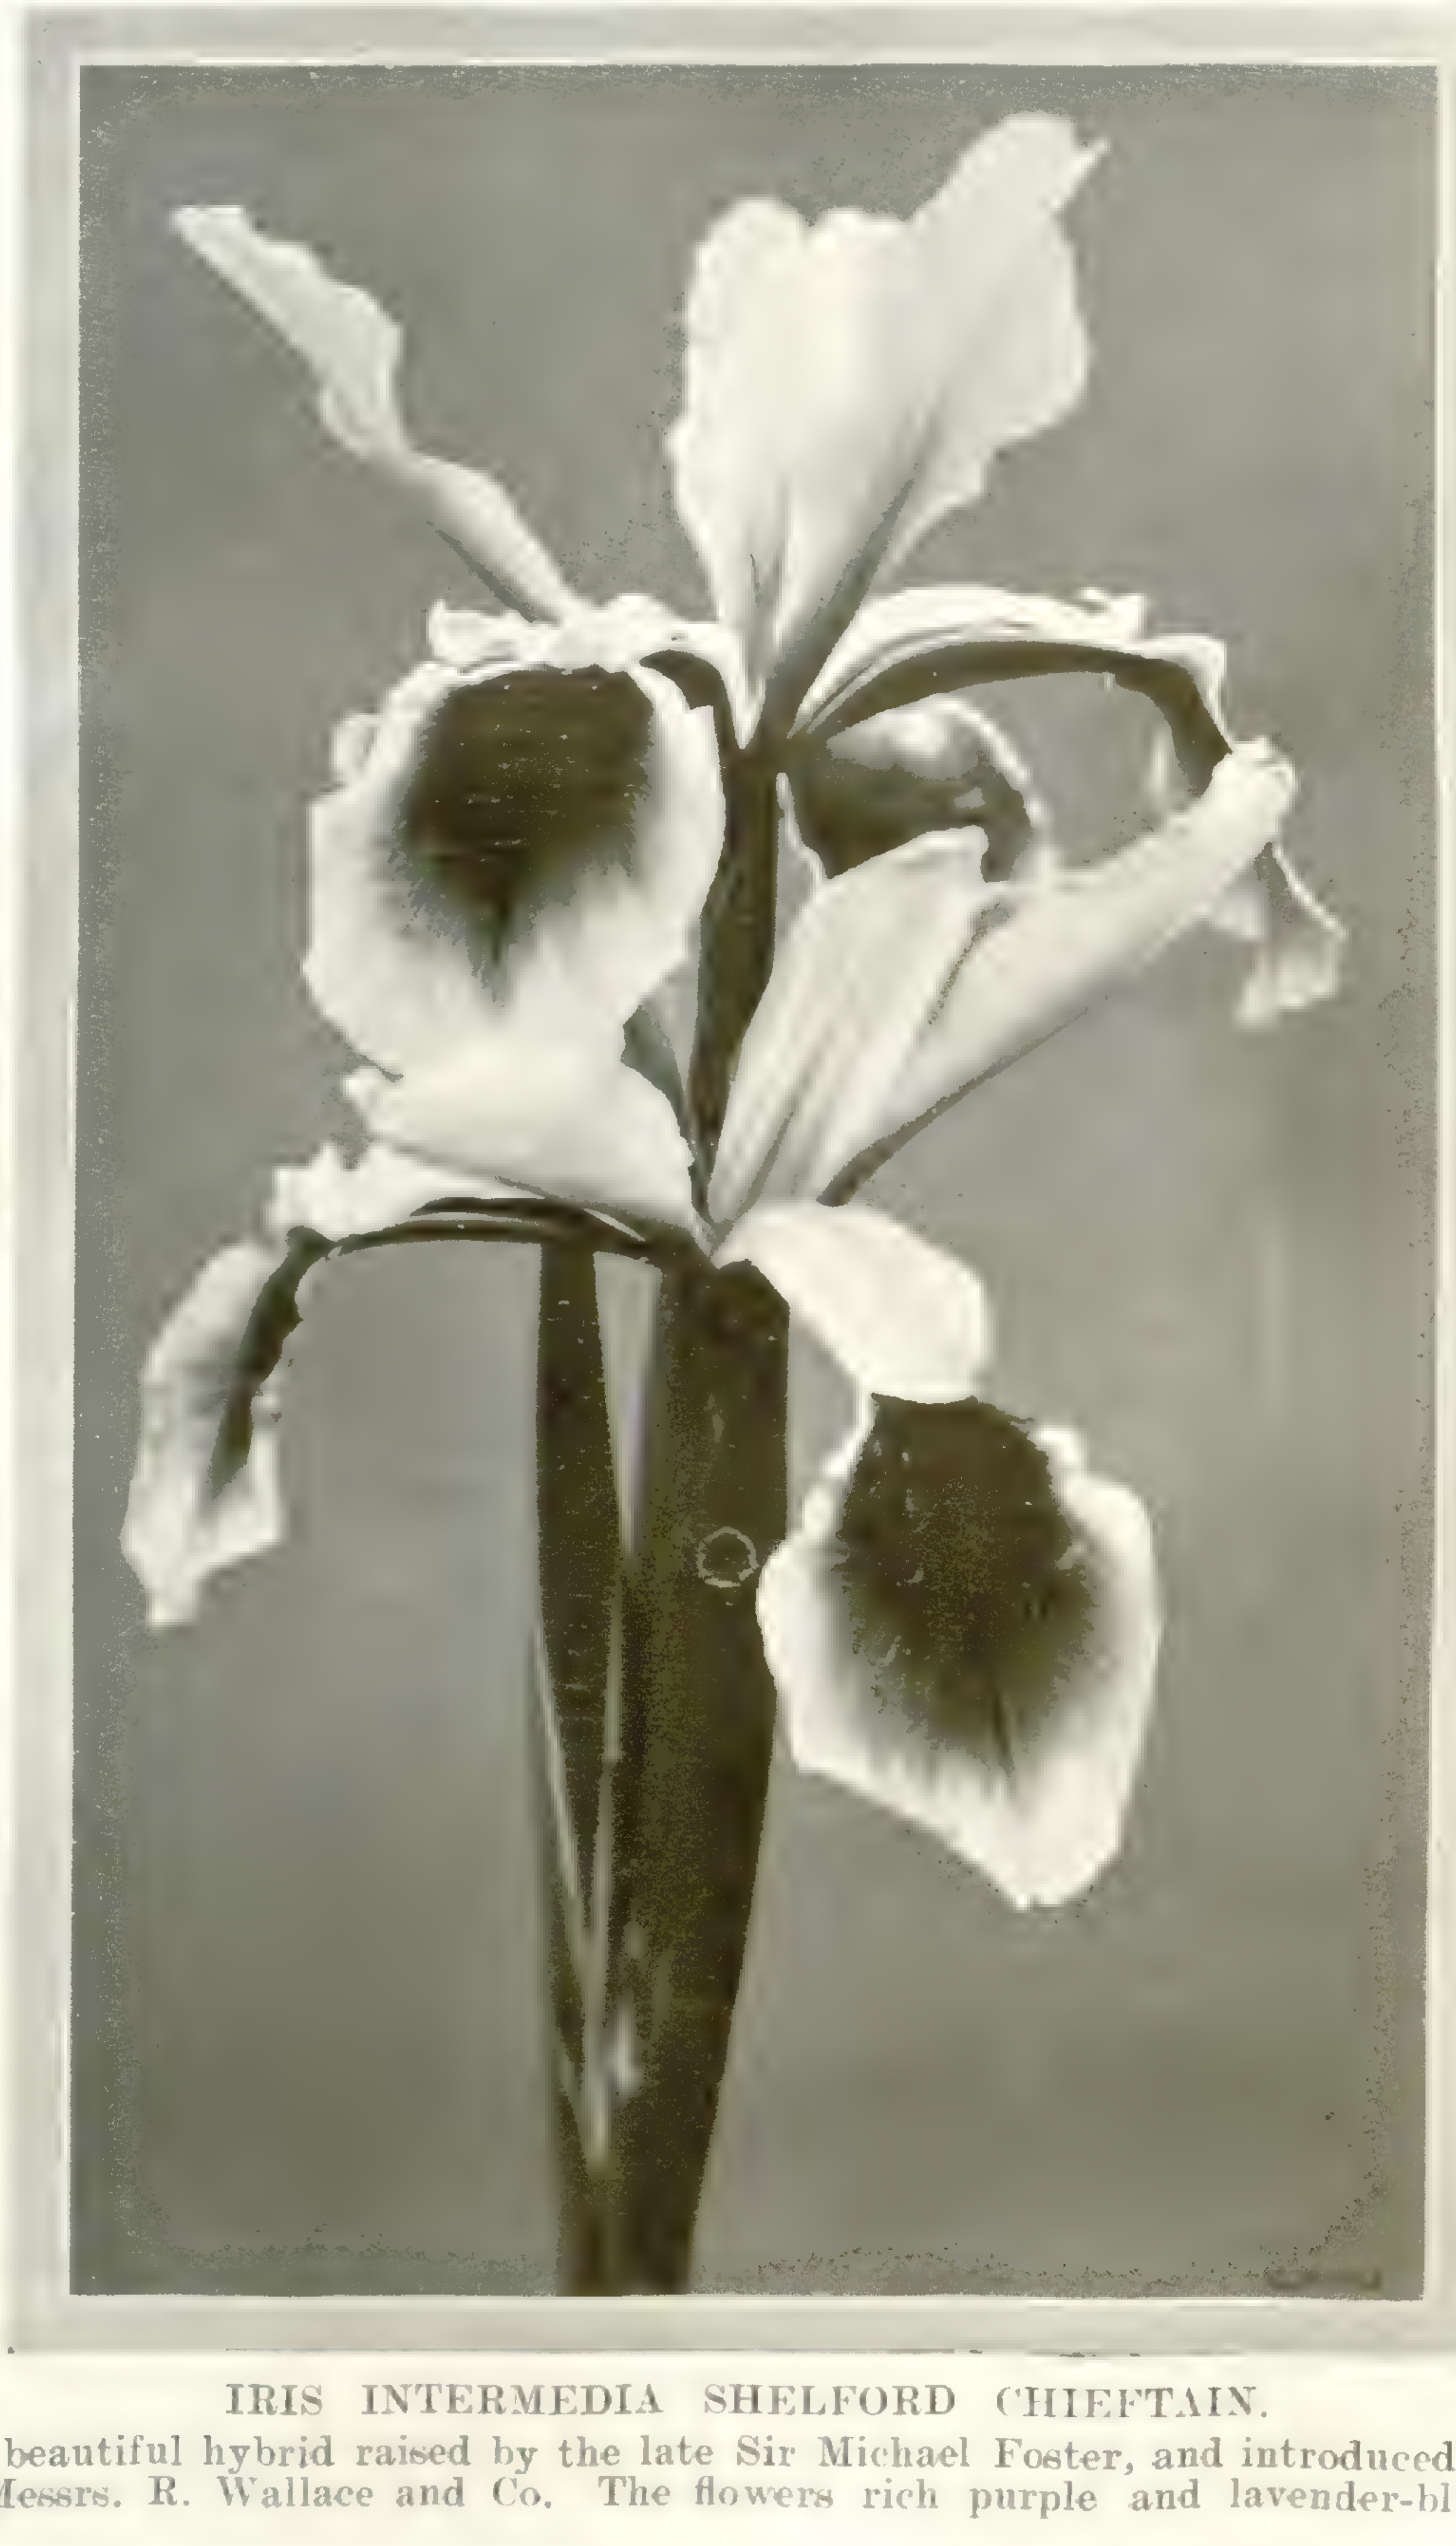
For potting composts this is a good substance to mix with the soil, not only to provide a lasting plant food, but to counteract the tendency to sourness in the pots, a pound to the bushel of soil being a fair amount to use. Though bonemeal is a better substance for this latter purpose, by reason of the nitrogen it contains in addition, the phosphates in it are less easily soluble than those in the basic slag, while the small percentage of free lime in the latter is also useful for pot plants, except in the case of those few families which are lime haters, e.g., the heath family. If kept in a dry place it can be stored for years without any deterioration.

Alger Petts.

The National Rose Society's exhibition fixtures for 1911 are as follows: Metropolitan Show, at the Royal Botanic Gardens, Regent's Park, on Friday, July 7; Provincial Show, at Ulverston, on Wednesday, July 19; Autumn Show, at the Royal Horticultural Hall, Westminster, S.W., on Thursday, September 14.

IRIS INTERMEDIA SHELFORD CHIEFTAIN.

This beautiful and distinct iris was raised by the late Sir Michael Foster, who, in his garden at Cambridge, devoted much attention to the hybridisation of species of iris, and is the result of crossing Iris Cypriana with I. pallida. It is interesting to notice that the flowers of the hybrid are much larger than those of either of the parents, and the plant itself attains a height of three feet or more. The standards are large, and of a very pronounced lavender-blue colour. The falls are exceptionally long, of a rich purple hue, and charmingly veined. The foliage has all the vigour of the best pallida forms, and has a good deal of the grey-green colouring that makes that section so very desirable for borders, as the plants show up well even when not in flower. Altogether, Iris Shelford Chieftain is a capital garden plant, distinct, and beautiful. It was well shown by Messrs. R. Wallace and Co., of Colchester, at the meeting of the Royal Horticultural Society held on July 19 last, when it attracted much attention.



IRIS INTERMEDIA SHELFORD CHIEFTAIN.

A beautiful hybrid raised by the late Sir Michael Foster, and introduced by Messrs. R. Wallace and Co. The flowers rich purple and lavender-blue.

EXHIBITIONS AND MEETINGS.

National Chrysanthemum Society.

The conference held by the above society at Essex Hall on December 5 was a success. The attendance was good, notwithstanding the inclement weather, and there was a beautiful display of late chrysanthemums on this occasion. A large group, composed of big Japanese, decorative varieties in great variety, singles, and tiny pompons was put up effectively by Mr. Phillip Ladds, Swanley Junction. A few of the leading varieties were December Gold, Mdme. Paolo Radaelli, Mensa, Edith Jamieson, and Baldock's Crimson. On the opposite side of the hall Mr. Norman Davis set up a delightful group of clean bright flowers, setting these up in very fine style. December Gold (F.C.C.) was in great form here, and other notable varieties in a charming exhibit were Thorpe's Christmas Rose, Fanny Lemon, Mdme. Rivol, Edith Jameson, Mrs. Rolfe, Framfield Pink, and Francois Blom, as well as Arcturus and Framfield White, both good singles.

Messrs. W. Wells and Co., Merstham, filled a table chiefly with single varieties, and their leading kinds were Cannell's Crimson, Jane Russell, Metta, Caledonia, Crimson Jewel, and Lady Furness (F.C.C.). The Messrs. Wells had also a grand new ivory-white Japanese variety named Mrs. Gilbert Drabble (F.C.C.)

Mr. Thos. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, sent vases of single and decorative varieties, the following being notable sorts: Cissie Rungay, Pictor, and Jack, each of which was commended. A stand of Japanese and incurved blooms, giving evidence of good culture, was submitted by Mr. J. Simm, gardener to W. W. Mann, Esq., Ravenswood, Bexley. Medals were awarded as follows: Silver-gilt, to Mr. Norman Davis, and also to Mr. Phillip Ladds; large silver, to Messrs. W. Wells and Co.; and small silver, both to Mr. Leech and Mr. Mann.

CONFERENCE.

The afternoon proceedings were presided over by the President, Sir Albert Rollit, who made a few remarks commending conferences for their educational value, and suggested that Mr. Norman Davis and Mr. W. Higgs should each read his paper, and the discussion be taken on the two together.

Mr. Norman Davis then read his paper on "The Culture of Japanese Chrysanthemums," which we hope to publish in a future issue.

INCURVED CHRYSANTHEMUMS.

Mr. Wm. Higgs, the famous grower of incurved blooms, followed with his paper—after Sir Albert Rollit had left to fulfil another engagement, and his place was taken by Mr. Thos. Bevan. This was a capital paper, that entered into unusual details, and was well delivered. He said:

In dealing with my subject I propose to give, as far as possible, my own experiences in the culture of incurved chrysanthemums. I must apologise if I mention anything which has been said so many times before on this subject, but, as I am treading on a well-worn path, my shortcomings in this respect will, I hope, be overlooked. To somewhat atone for them, I will endeavour to put before you points in the routine of chrysanthemum growing which are not usually given in the "guide book."

We must remember that throughout the year, from the November of one year to the November of the next, it is our aim to produce a perfect flower. Every part of the treatment of the plant must be in conjunction with that aim. Neglect in attention to the cutting or to the young plant is just as fatal as neglecting the flower. During the summer months the plant must be kept healthy, and its growth must not receive any check. The wood must be well-ripened. These, and many other points like them, all tend to produce large and well-formed flowers.

The keynote to success is careful cultivation day by day, and never one day of neglect.

On an equality with this regularity is the necessity of attending to small matters, and, therefore, if I seem to give undue prominence to a seemingly unimportant phase in the stages of growth in a chrysanthemum, it is because I am bearing this fact in mind.

Chrysanthemums are, in their way, very much like children. Each variety possesses its own little peculiarities. Just as Johnny has a special liking for chocolates, while Tommy's æsthetic taste has an inclination for the consumption of toffee, so Lady Isabel's taste differs from that of Clara Wells. The individuality of each variety must be kept in mind in the treatment of the plant.

Incurveds have always been my favourites. I have studied their growth for many years. On looking back to the old varieties, the Queen family, the Princess of Wales and its sports, the Jeck family, Venus, Refulgence, Princess Beatrice, John Salter, Lady Talfourd, and White Globe, one cannot help noticing the great strides which have been made in size and colour, although, for colour, we have not yet beaten Refulgence as a dark variety, or Jardin des Plantes as a yellow.

Had not Japanese blood been worked into them, incurved flowers would have indeed been much smaller than they are to-day, and we should not have had the brighter colours.

As regards shape, the Queen family of fourteen or fifteen years ago were models of what an incurved flower ought to be. No variety could be considered nearer perfection than a well-grown Lord Alcester or an Empress of India. The Queens were not made much use of for seeding purposes, or we should have had some of the same type now. Amongst all our varieties of incurved chrysanthemums we have not one resembling a Lord Alcester. Taking everything into consideration Clara Wells is the best variety we have at the present time.

We may roughly divide the biography of a chrysanthemum into the following stages:

(1) The old stool, which is instrumental in the production of the cutting.
(2) The cutting itself.
(3) The young plant in its earliest stages.
(4) The growing plant as it is seen in its summer quarters.
(5) The fully grown plant bearing its flowers.

I will now deal with the first of these stages—the treatment of the old plant to produce good, healthy-looking cuttings. Even at this early stage it is well to remember that a good start is necessary to ensure a good finish. If the old stool shows a number of good cuttings it is all well and good. If, however, a variety is shy in producing cuttings some special treatment is necessary. This is best carried out in the following manner: Take some good-quality loam and sift it through a coarse sieve. Mix this with the same quantity of sifted decayed leaf-mould and apply it lightly as a top-dressing. Plants treated in this way not only produce more cuttings but the cuttings which appear are considerably stronger and are more likely to develop into good plants.

When inserting the cuttings the late varieties must receive the earliest consideration. I always insert these as early as the first week in December. Frank Hammond, Mrs. F. Judson, Mrs. J. Hygate, Charles Curtis, W. Pascoe, Mrs. J. Wynne, Duchess of Fife, H. Hearn, Egyptian, Miss Nellie Southam, may all be classed as late sorts, and must be started early.

Next we come to those varieties which require a second crown bud, and which should be inserted during the third week in December. A list of these would include such varieties as Lady Isabel, Mrs. G. Denyer, H. W. Thorp, Mrs. Barnard Hankey, Pantia Ralli, Ialene, W. J. Higgs, Romance, Le Peyron, Amber Beauty, Emblême Poitevine, Topaze Orientale, Triomphe de Montbrun, May Phillips, Miss F. Ashworth, Doris Rayner, G. F. Evans, W. Biddle, Calypso, Hanwell Glory. Other varieties which require a late crown bud might be inserted about the same time. Amongst these would be found Clara Wells, Buttercup, Daisy Southam, and Frank Trestian.

When putting in the cuttings it is as well to sacrifice a little space for the sake of the welfare of the plants. Personally, I always put them singly in thumb pots. If three or four cuttings are put in the same pot it is not only possible, but very probable that the growth of those cuttings will be checked when the first repotting comes. The roots of the plant will be unable to spread in all directions, and they will also become entangled with those of the plant next to it.

Prepare a frame with a bed of sifted ashes for the reception of the "thumbs," a frame where heat can be turned on in severe weather, and the temperature kept fairly constant. Plunge the pots to some little depth in the ashes, and give the cuttings a light syringing to prevent them flagging. Next we come to the first potting, and, of course, the most important point at this stage is the composition of the soil. Equal parts of sifted loam and decayed leaf-mould should be taken, with some silver sand to keep the soil open. On no account should manure of any description form part of the compost, for at this period the chief thing to guard against is getting the plants too strong. Personally, I think that one of the most important reasons why some growers fail to produce the smooth round buds which are necessary to make the perfect flower can be traced to this error. If manure is included as a constituent of the soil the growth becomes too rank altogether, hollow stems are produced, and, generally speaking, the flower which follows the hard, badly-shaped bud, does not open freely.

The earliest plants will be ready for the first repotting in large 60's from the middle to the end of January, while those whose growth is more slow will follow later. After they are all potted up, place the plants back in their places in the frame just as before, except that they should be given a little more room. As they grow larger more light and air will be required, and consequently with each potting they should be placed farther and farther apart. Thus the plants are kept "stocky," and present a bushy appearance to the eye. When ventilating the frames, a little more air may be allowed after the plants have been potted for two or three days. In the beginning of March, when we may say fairly safely that the sharpest of the winter frosts have been left behind, the plants may be transferred to cold frames. Some effective covering must always be kept near at hand in case of a likely cold night. This guard against the frost should be very thick, for a very low temperature is fatal to the young and tender plants. An excellent covering can be made by first covering over the tops of the frames with stout garden mats, and then placing a layer of straw over the mats.

The next shift into 6in. pots will take place towards the end of March, the composition of the soil being the same as before, but the loam should be a little coarser. This second repotting having been completed six or seven days, select the varieties which require second crown buds, and carefully take out the point of each plant. The plants are now beginning to get interesting, for before they are too far advanced we must discern which are the weaker varieties, and plan out for them a different course of treatment. Instead of the usual 6-in. they should be shifted into 5in. pots, for they will never produce exhibition flowers if over-potted.

Special care will also be needed in watering, and a light spraying over regularly every day will be found to be very beneficial. The plants can now be allowed to grow on with careful and regular attention until the end of May, when the most important part of their career occurs. This is the final shift into the flowering pots, 9in. or 10in., according to the characteristics of the growth of the plant. The weaker varieties originally in 5in. pots will now require 9in. pots. All other varieties can be moved into 10in. pots.

The composition of the soil here is of utmost importance. It is best to get it prepared two or three weeks before it is required. Personally, I find that the best method to employ is to mix up the soil in two separate heaps, the chief difference in the composition of the heaps being that one contains manures, while the other does not. It is necessary to have two different strengths of soil, for some varieties, if grown in very strong soil, would produce very rough flowers, which no amount of dressing would make fit for an exhibition board. We may roughly classify all kinds of incurved blooms into two divisions—those which naturally come with a true, narrow incurved petal, and those which, unless specially treated, would probably resemble a small "Jap.," and which have Japanese blood in them. For the sake of clearness we will label the former sorts "weak," and the latter "strong." It naturally follows that in the true incurved varieties the chief aim is to obtain a big bloom, for in nearly every case the flower produced will not be rough and uneven. Hence manure is included in the constituents of the compost for the weak varieties. In the case of the strong sorts the chief aim must not be size alone, it must be the biggest flower that can be obtained, and at the same time the best formed, smoothest, and most incurved. Where before we could almost ignore the shape of the petal, here it becomes the chief factor, and when growing "strong" varieties we must fine them down, as it were, and produce as fine a petal as possible. This also saves a great deal of work with the tweezers later on.

For the weaker sorts the following soil is mixed up: Twelve barrowloads of good turfy loam, three barrowloads of horse manure, which has been treated in the same manner as when preparing soil for a mushroom bed, two barrowloads of decayed leaf-mould, and one barrowload of wood ashes. To this add ¼cwt. of bone-meal, a 10in. pot of soot, and the same quantity of Veltha. The soot and wood ashes supply the carbonaceous matter required by the plant, while the bone-meal contributes the valuable manurial phosphates.

The plants take up the Velthã through the roots and stem to the leaves and rust is prevented to a great extent. I do not wish to make any rash statements, and say that Veltha will keep away rust altogether; but if the rust does attack the leaves when the plants have been so treated, the attack will not be anything like so heavy as if the Veltha had been omitted as a constituent of the compost.

In mixing the soil for the stronger sorts I leave out both the horse manure and the bone-meal, substituting in equal proportions leaf-soil and wood ashes. The other materials are mixed just the same as in the first heap of soil. Having prepared the soil the true incurved varieties must then be chosen for potting, the majority of them in 10in. pots. Amongst these should be found Clara Wells, Mrs. G. Denyer, H. W. Thorp, Duchess of Fife, Daisy Southam, Topaze Orientale, Frank Hammond, Charles Curtis, Frank Trestian, W. Pascoe, Pantia Ralli, Miss Nellie Southam, Mrs. J. Wynn, Amber Beauty, and Romance.

For the poorer soil Buttercup, Lady Isabel, Mrs. Barnard Hankey, Emblême Poitevine, Mrs. J. Hygate, Triomphe de Montbrun, May Phillips, Miss F. Ashworth, Ialene, Doris Raynor, W. J. Higgs, G. F. Evans, W. Biddle, J. Agate, Le Peyron, Calypso, H. Hearn, Miss E. Holding, Godfrey's Eclipse, Souv. de Wm. Clibran, and Egyptian might be selected.

Having knocked out the plant from the small pot, it should be placed in a well crocked pot, the weak sorts having crocks and a layer of inch bones and the rest crocks only. The soil is then placed round the roots, and well rammed down with a piece of wood, shaped specially for the purpose. This ramming is most important, and on no account must be neglected, as it produces short-jointed growth, followed by deep well-formed flowers. It is necessary to leave room at the top of the pot for two top dressings which are to follow, the soil for these consisting of finely-sifted loam and leaf-mould in equal proportions with a little Ichthemic guano. A 60-pot of guano to a bushel of soil. These have the effect of keeping the roots active on the surface. The first top dressing should take place in the middle of August, and the second after the plants are housed in the middle of September. Immediately after the dressing care must be taken in watering so that the soil on the top is not disturbed. Having completed the final potting, the plants are stood out in the open in a favourable position. The sunlight should have free access to them, and if possible a spot should be chosen for their summer quarters where there are no tall trees or high buildings in the neighbourhood.

Watering at this stage needs special care. Very careful attention must be paid to this point for the first fortnight or so after the potting. Overwatering is certain to cause a check in the growth of the plants, and it will take them some considerable time to get over it. Excessive saturation soon turns the leaves yellow, and first-class flowers are cut of the question. Rain water produces the best results, and should be used if procurable.

After a hot dry day a good syringing overhead during the evening will be beneficial. It also helps a great deal to keep down the thrips which do so much damage to the young shoots and buds. Besides thrips the grower has to guard against attacks of mildew, fly, and chrysanthemum rust. As a preventive and a cure for mildew, potassium sulphide has no equal. When dissolved in water, in the proportion of ½oz. of sulphide to one gallon of water, it is very effective. The best method of applying this solution is to stand the plant in an oblique position, so that the pot rests on a stool, then none of the insecticide will fall on the surface of the soil. In the use of any chemical remedy for a disease on the leaves this point must always be borne in mind, the obvious reason being that in the event of the liquid reaching the roots, harm might come to the plant. The solution of potassium sulphide is syringed on to the leaves, thoroughly wetting the underside of every leaf, at the same time being careful not to allow the mixture to reach the soil.

Attacks of greenfly may be warded off by using Abol insecticide in a similar manner, except that the points of each growth should receive a very thorough syringing.

As regards rust, besides including Veltha in the soil, a careful watch must be kept for the earliest signs of spores. These should be treated with paraffin oil, the remedy being applied with a small paint brush of the common or garden variety. Once rust gets the upper hand the leaves suffer, and apparently look as if they have been partially burnt. Consequently the flowers do not open at their best.

Simultaneous with watering comes the question of stimulating the growth with manures—both natural and artificial. There are a great number of the latter on the market, many of them no doubt splendid in their way, and finding many supporters amongst growers of chrysanthemums. Personally, I find guano, sheep manure with an addition of soot, and fresh blood from the slaughter house—all three to be of great value in improving in many ways the condition of the plants and flowers. I commence feeding with sheep manure early in August, with a fairly dilute solution, increasing the strength as the plants get stronger. Watering with solutions of blood or guano should be substituted sometimes for the sheep manure in order to supply salts of all the elements needed for plant tissues in a readily soluble form. Care must be taken not to make the solution of blood too strong, or the plants will receive a check, and even, perhaps, be spoilt altogether. A normal mixture is obtained if half a gallon of coagulated blood is mixed with 25 gallons of water; that is, a 2 per cent. solution.

It will be as well to remember that manurial substances must not be selected or applied indiscriminately. They must contain nutritive material, which is easily soluble in water, and which is necessary to the growth of the plant. The fewer superfluous substances present the better. The elements indispensable for healthy growth are carbon, oxygen, hydrogen, nitrogen, sulphur, phosphorus, calcium, potassium, magnesium, and iron. In the absence of even one of these elements normal development does not take place. The original source of phosphoric acid in manures was bones, but mineral superphosphates have in great measure taken their place. Of the nitrogenous manures, guano is the best, some kinds containing as much as 13 to 14 per cent. of nitrogen, and from 13 to 14 per cent. of phosphoric acid in the form of phosphates. Guano also contains potassium and ammonium salts, and its high manurial value is due to the fact that it is a general fertiliser, yielding all the constituents of plant food in a condition that can be readily assimilated. It imparts a dark rich green to the foliage and promotes the growth of the herbaceous parts of the plants.

Blood contains many of the elements of plant food in a condition easily taken in by the plant, including hœmoglobin—a kind of albumen, which, of course, is nitrogenous; together with the chlorides and phosphates of potassium, sodium, iron, calcium, and magnesium.

Chrysanthemums may be fed with these manures until the flowers are about half-expanded, when the pots will contain sufficient plant food to finish off the blooms, and there will be no need to enrich it till the growth of cuttings is required.

Housing should be commenced about the middle of September and a dry, fine day should be chosen. A few of the earliest buds should be placed under shelter in a shady situation before the average plants are put under glass. This prevents them to some extent from opening as quickly as usual, and they are more likely to be useful on show day. The earliest buds should not appear before August 20. If any are taken before this date they invariably develop into rough flowers, having the appearance of an incurved Jap.

We now come to the most interesting part of chrysanthemum growing, when we have the pleasure of seeing and realising the result of our labours—the reward of ten or eleven months' careful attention when we are able to watch the petals as they unfold. It will be easy to pick out the plants on which the best blooms will probably develop, and these can occupy the best places under glass. The clean, round, perfectly-shaped bud cannot be mistaken, and the plants whose buds are promising poor flowers can be placed together in a less favourable position, unless one happens to be lucky enough to have large flowering houses where every bloom has a good chance. As the flowers expand a slight shade will be necessary to protect the newly-opened, delicate petals from the rays of the sun. The shading should be such that it is easily put up and easily removed, according to the vagaries of the October weather. An even temperature should be aimed at in the houses, for if the thermometer rises too high the petals will reflex, and more labour will be needed with the tweezers. 55 deg. Fahr. during the day time, sinking to 50 deg. at night is a suitable temperature. As regards ventilation, a little front and top air should be left on at night, the amount varying with the outside temperature. A through circulation of air must always be going on, so that no moisture is allowed to condense on the petals.

Before the blooms are fully developed it is sometimes advisable to put a little work on them with the tweezers, and here I will say a few words on the subject of "dressing."

It is necessary to have good tools to work with, so that even the proverbial bad workman will have no excuse except his own carelessness. A good dresser is a real treasure, for his labour might make all the difference between the cup that is, and the cup that might have been. Here the ladies have a good chance to apply their persuasive efforts, and I have heard that some attain the heights of perfection; but rather than tread on dangerous ground — Mum's the word!

Unless one is specially gifted, dressing incurveds needs some years of practice, since the time which can be devoted to it in one year is so limited. A fortnight or three weeks at the most is the usual period at the disposal of the grower. But much progress can be gained under good tuition, and if one knows how, and is persistent, dressing soon becomes easy.

Good dressing often overcomes the great difficulty of getting thirty-six flowers at their best at the same time. Take, for instance, a big flower which is not out. All the short petals in the centre should be carefully taken out with the long forceps, then turning the flower upside down the petals should be gently pressed to fill up the hole in the centre. The badly-shaped petals must be taken out if they have not already been attended to while the flower was on the plant. Then with the small tweezers commence arranging the petals in position from the centre downwards. It is best to take hold of the petals half-way down, then, if a petal is accidentally bruised in the process, other petals which overlap it will cover up the defect. Some flowers require an hour's work spent on them, others much less, the time depending upon how perfectly the bloom has been grown. Experience teaches the grower which varieties can be dressed without much fear of bruising, and which must be left till an hour or so before the judges appear. Some flowers show the least touch, and if these are dressed on the day preceding the show, they will probably be useless as specimen blooms. Most of the darker varieties are easily bruised; but it is useless to attempt any classification, only close contact with flowers can give the necessary knowledge.

*** Owing to the pressure on our space we are compelled to leave over the remainder of the report of the Chrysanthemum Conference until our next issue.

Potato Show, Birmingham.

The exhibition of potatoes in Bingley Hall was very interesting, some 2,650 tubers being staged in the several classes provided, and as the entries were numerous "reserve" cards were awarded in each of the ten classes. There were many bright looking collections, but we have seen them better. Eight competitors staged in the class for twelve dishes of a dozen tubers each, the post of honour being occupied by Mr. W. Coleman, 4, Hunter Street, Buckingham, who was strong with shapely and bright specimens of Dalmeny Beauty, Provost, Scot, Mr. Bresee, Superlative, Purple Perfection, Talisman, King Edward VII., Factor, Up-to-Date, Table Talk, and Queen of the Veldt. The second prize was awarded to the Duke of Portland, Welbeck Abbey, who had White City, Mr. Bresee, Up-to-Date, The Sherwood (new), Sutton's Abundance, Satisfaction, White Kidney, Superlative, Windsor Castle, Factor, and King Edward VII. in excellent condition; and Mr. J. W. Needham, Wildsworth, Gainsborough, was third with Table Talk, Red Kidney, May Blossom, Royal Kidney, Up-to-Date, Chapman, King Edward VII., Eclipse, White City, Evergood, Factor, and Northern Star; Mr. J. Neaverson, Eye, Peterborough, taking the reserve card. For six dishes Mr. Coleman once again headed the competitors, Mr. Needham second, and Mr. Neaverson, third. For two coloured and two white varieties Mr. Coleman led with large, shapely specimens of Mr. Bresee (very fine), Factor, Superlative, and Purple Perfection (a shade dull); Mr. Needham second, his selection being King Edward VII., Evergood, Mr. Bresee, and Factor; Mr. Neaverson third, his dish of Goldmine being truly handsome. In the class for four varieties suitable for farm or field cultivation, there were some thirty dishes, Mr. Neaverson scored a premier with bulky but fairly shapely specimens of King Edward VII., Evergood, Satisfaction, and Langworthy; Mr. Coleman a close second with Superlative, Factor, Talisman, and King Edward VII.; Mr. Needham third. For two dishes of kidney-shaped Mr. Coleman led, putting up Superlative and Factor; Mr. Neaverson second, and Mr. E. Ashley, Irlam, Manchester, third. For two dozen round Mr. Coleman obtained premier honours with Purple Perfection and Provost; Mr. Thomas Bannister, Marston Green, Birmingham, second; Mr. Neaverson third. For one dish of Kidney or long variety, Mr. Coleman first with Superlative, and Mr. Neaverson second; and for a dish of round Mr. T. Bannister was first for Table Talk; Mr. Neaverson second. Mr. Bannister occupied the first place in the class for the handsomest dish with a very pretty dish of Up-to-Date; Mr. Coleman second. There were four entries for new varieties not yet in commerce, and Mr. B. Parker was first with Stors Castle Seedling, a white kidney of the Up-to-Date type; the second prize was awarded to Mr. Needham for Trent Cropper, certainly a handsome white pebble-shaped tuber; the Duke of Portland taking the reserve card for The Sherwood, a flat pebble-shaped white tuber.

The trade exhibits contributed much to the interest of the exhibition. Messrs. E. Webb and Sons, Wordsley, contributed a large and tastefully-arranged stand comprising roots, grass seeds, potatoes, onions, seed corn, and fruit, all of which was of the highest quality. Messrs. Dicksons, Lim., Chester, who had an excellent arrangement of grasses and clover seeds occupying an angle; the King's Acre Nurseries, Hereford, made an attractive exhibit with about five dozen dishes of highly-coloured home-grown apples; and the Agent-General of British Columbia had an exhibit of fresh fruit, in cases and otherwise.

Smithfield Club Show.

The show of fat cattle, roots, implements, etc., held during the week at the Agricultural Hall was necessarily very similar to that of last year and previous years, but it is interesting and gratifying to note steady improvement in both animal and vegetable exhibits year by year, and in regard to the latter, which are of more direct interest to the readers of the Gardeners' Magazine, it may be said that the well-known seed firms who annually put up imposing displays of roots and other produce, staged this year in a manner that leaves little, if any, room for further improvement. Messrs. Sutton and Sons' extensive collection of finely-developed mangolds and swedes was supplemented by choice vegetables, and by examples of insect pests, showing the damage done by each to the particular crop it affects. Printed particulars, with hints on methods of destruction, added value to the exhibit. A capital lot of roots came from Messrs. J. Carter and Co., and some beautiful examples of "Record" onions and other high-class vegetables. Photographs of the new general offices of the firm recently opened at Raynes Park, S.W., were exhibited.

Among the capital lot of potatoes exhibited by Messrs. Fidler and Sons, Reading, Commodore, a round white; Dreadnought, a white kidney of excellent shape and character; and Improved Imperator were among the more conspicuous. Upwards of sixty varieties were shown on this stand. Messrs. E. Webb and Sons, Wordsley, Stourbridge, as is their usual custom, displayed choice onions and potatoes in quantity and variety, thus enhancing the attractiveness of the stand, which, of course contained a grand lot of farm roots and samples of corn. A new potato of handsome appearance and great promise was shown by Mr. Wm. J. Reid, Fordhouse, Montrose, Arran Chief by name, this potato is beautifully even in form and has a quite distinct rough skin that gives the potato almost a netted appearance. Fruit was shown by the Government of British Columbia. From Messrs. Dicksons, Lim., Chester, came apples of both kitchen and dessert varieties, as well as some good potatoes. The stand was decorated with vases of choice perpetual carnations. Messrs. W. Horne and Sons' collection of apples from Cliffe, Rochester, included some splendid fruit of particularly good colour, and the trees shown were very clean and healthy.

Messrs. Harrison and Sons, The Market Place, Leicester, contributed some very good carrots, beetroot, and onions, their Giant Zittau was of excellent type and pretty appearance, the skin being fine and of a golden russet colour. Ailsa Craig was also shown, and we noticed some splendid leeks, the variety being Leicester Hero. Apples from King's Acre Nurseries, Lim., Hereford, were staged in capital style, and the varieties, numbering about 75, were representative of the leading dessert and culinary sorts. Rival, Edward VII., King's Acre Bountiful, and the quite new Admiration were a few of special merit. Another good lot of fruit came from Messrs. Laxton Bros., Bedford. Annie Elizabeth, Fearn's Pippin, Wealthy, High Canons, and Golden Spire were a few among their many kinds.

Scotch seed potato growers were, as usual, well to the fore, and many new varieties were shown, some of which bore great promise.

Colonial Fruit Show.

A fine exhibition of Colonial fruits was held at the Horticultural Hall, Westminster, on December 1,2, and 3, this making the fourteenth exhibition of its kind arranged by the Royal Horticultural Society. The exhibition was opened by Sir Edward Grey in the presence of a large company that included many Colonial celebrities.

Under the auspices of the Government of British Columbia the whole of the orchestra, specially put up for the occasion, was filled from top to bottom and side to side with magnificent apples in cases as packed for the British markets. These were supplied by various growers, and came from the leading fruit districts of the celebrated province. There were altogether twenty-two tons of grand fruit in this extraordinary exhibit. Not only did the province fill the orchestra, but they had scores of cases across the end of the hall, just inside a line of rustic arches and fencing that outlined their limits. Some of the apples staged, either in boxes or baskets, and that at once caught the eye by reason of their size, brilliance, or other good qualities, were Newtown Pippin, Gano, King of Tomkins County, Blue Pearmain (a striking variety), Cox's Orange Pippin, Deux Ans, Grime's Golden, Spitzenberg, McIntosh Red, Jonathan, Baldwin, Ontario Red, Gravenstein, Stark, and Fallawater. There were not, however, a very large number of varieties, and the highly-coloured sorts were greatly in evidence. There were about a thousand boxes of fruits, and the display was one that was at once impressive, a magnificent example of fine culture and splendid packing, and, probably, the largest exhibit of apples ever put up in Europe.

All other displays paled beneath the overpowering exhibit from British Columbia, but New Brunswick put up a large group of apples, and these latter, while attractive, lacked the size and brilliance of the Columbian fruit, and, moreover, gave evidence of the need of improvement in packing; this group was arranged by Mr. A. Bowden, 27, Southampton Street, E.C., the London representative of the New Brunswick Government. Among the best of the apples from New Brunswick were Bethel, Ben Davis, Golden Rennet, Fameuse, Gano, Ontario Red, and Wealthy. Bethel was the variety most largely shown. The London agency of the Kootenay District of British Columbia 7, John Street, Adelphi, had a small, but very fine set of brilliant and clean apples, their samples of Cox's Orange Pippin being unusually plump and bright. A long table of finely grown and well packed apples, all Columbian grown, was arranged by Messrs. Garcia, Jacobs, and Co., 19, Bow Street, Covent Garden.

Opposite the chief entrance the West Indian Committee, 15, Seething Lane, E.C., had a display which included a fine lot of oranges, grape fruits, and bananas, submitted by Messrs. Elder and Fyffes, and a number of bottled fruits and limes from

Dominica, but as the steamer conveying the fruits and vegetables for the Dominica section was delayed, it was not possible for this West Indian island to be properly represented on the first day. Messrs. Astor W. Gardner and Co., Gamage Buildings, Holborn, and Jamaica, sent beautifully packed seedless oranges and cases of large pale green grape fruits—the latter suggested as a cure for influenza. This company had also on view an interesting collection of photographs of fruit culture in Jamaica. The Rosean Valley Fruit Company, 46, Swan Street, E.C., contributed both orange and lime marmalade, made from Dominican fruits.

As usual, the West Indian Produce Association, 4, Fenchurch Buildings, E.C., had an extensive and interesting exhibit. There were bananas, limes, oranges, grape fruits, cocoanuts, sugar cane, and green ginger, crystallised fruits, preserves, and liqueurs in almost bewildering variety, and an assortment of Jamaica cigars, wherewith to "smoke Imperially." West Indian curios in bead work, and a collection of nuts and spices, calabashes, and swizzle sticks, completed the display. Messrs. Westmacott and Co., 150, Leadenhall Street, contributed South African produce, including wines, liqueurs, Cape gooseberry jams, grape jams, calabash pipes, etc.

Mr. W. H. Plowman, one of the R.H.S. officers, and one who has made fruit bottling a close study, exhibited a collection of apparatus necessary for the purpose of bottling fruits, and also samples of fruits treated. On the Saturday afternoon Mr. Plowman gave a lecture on "The Preservation of Whole Fruits." From the Fruit and Cyder Institute, Long Ashton, Bristol, came samples of ciders and a small collection of cider apples, such as Court Royal, Dymock Red, Skyrme's Kernel, Rouge de Treves, Kingston Black, Strawberry Norman, and Chisel Jersey.

AWARDS OF MEDALS.

Gold Hogg Memorial Medal.—To the Government of British Columbia for a collection of apples, comprising over one thousand cases.

Gold Medal.—To the West Indian Produce Association, 4, Fenchurch Buildings, London, E.C., for a collection of West Indian Produce, including citrus fruits, liqueurs, and preserves; to the Exhibition Committee of Dominica, West Indies, for citrus fruits, etc.; to Messrs. Garcia Jacobs and Co., Covent Garden, for British Columbian apples.

Silver-gilt Hogg Medal.—To the Botanic Station, Dominica, W.I., for citrus fruits.

Silver-gilt Knightian Medal.—To the Salmon Arm District, British Columbia, for apples; to Messrs. Randall Bros., Sheffield, New Brunswick, for apples; to Messrs. I. C. Gillman and Son, New Brunswick, for apples.

Silver-gilt Banksian Medal.—To the Grand Forks District, British Columbia, for apples; to the Vancouver Island District, British Columbia, for apples; and to Mrs. Smith, Spence's Bridge, British Columbia, for apples.

Silver Knightian Medal.—To the Government of New Brunswick for fifty boxes of apples; to Mr. W. C. Staples, New Brunswick, for apples; to St. Aroment Estate, West Indies, for lime and lime juice; to West Kootenay District, British Columbia, for apples; to Okanagan District, British Columbia, for apples; to Kamloops District, British Columbia, for apples; to the Kere[illegible] District, British Columbia, for apples; to Jamaica Agency, London, for citrus fruits, etc.; and to Messrs. Westmacott and Co., for Colonial wines, jams, etc.

Silver Banksian Medal.—To Kootenay District Agency, British Columbia, for a collection of apples; to Mr. J. W. Clark, New Brunswick, for apples; to Mr. G. H. Laws, British Columbia, for apples; to Everton Estate, Dominica, West Indies for citrus fruits; to the Wall House Estate, Dominica, West Indies, for limes; to Messrs. Elders and Fyffes, London, for citrus fruits; to Army and Navy Auxiliary Stores, London, for a collection of colonial fruits.

Bronze Banksian Medal.—To Roseau Valley Fruit Company (manager, T. Hankinson, Esq., 46, Swan Street, S.E.), for colonial preserves, etc.; to British Columbian Development Association, for a collection of fruits, books, and pictures.

MISCELLANEOUS AND INDUSTRIAL EXHIBITS.

Silver Knightian Medal.—To Mr. W. H. Plowman, 20, Rampayne Street, London, S.W., for collection of patent sterilizers; to Messrs. McDoddies, Kennington, for dried vegetables.

Silver Banksian Medal.—To the National Fruit and Cider Institute for cider and cider apples.

Birmingham Gardeners' Association.

There was a large attendance of the members at the last meeting, it being the ever-interesting question night. Mr. C. H. Herbert (the vice-chairman) presided. A matter of paramount importance was that of the action of the London County Council in appointing a military officer as Chief Officer of the London Parks and Gardens. After a short discussion, it was unanimously agreed that an expression of disapproval be forwarded by the secretary to the proper quarter. Other questions included: Which kind of flower during the last fifty years has made the greatest advance in improvement? One member stated that, in his opinion, the begonia must be regarded as having made the greatest advance. Others cited the rose and the sweet pea, followed by the carnation, chrysanthemum, and cyclamen. Another question was: How to acquire the highest colouration in the codiæum, Various suggestions were forthcoming, the chief being the use almost intact of a good virgin loam; peat and loam; peat alone; a high temperature combined with dense atmospheric moisture, manurial or otherwise.

Mr. W. Gardiner gave a brief account of his visit to Bingley Hall, and stated that he was especially interested in the potato classes, in which Mr. W. Coleman, Buckingham, was the champion winner with shapely and fine quality tubers. The production of such fine tubers by Mr. Coleman was highly creditable considering that in the Buckingham district the soil is not altogether naturally conducive to the production of high-class potatoes. The secret of success, however, was the judicious preparation of the soil.

Another interesting feature of the meeting was a description of the summer annual outing (in July last) of the members and lady friends to the Cotswolds in West Gloucestershire by Mr. W. Gardiner, the venues being the historic Sudeley Castle, the seat of Henry Dent Brocklehurst, Esq.; Toddington Manor, the seat of Hugh Andrews, Esq.; and Dumbleton Hall, the seat of Mrs. Eyres, splendid estates that almost adjoin. Another object of special interest was the neighbouring quaint and ancient market town of Winchcombe. The discourse was listened to with evident interest, and the essayist remarked that he was urged to give it by the desire that, especially the newer and younger members of the association should be stimulated by the desire to take advantage of such pleasing and instructive visits.

Prior to the ordinary meeting a committee meeting was held for the consideration of the spring programme.

Bournemouth Gardeners' Association.

Mr. J. J. Kettle, of Corfe Mullen, Dorsetshire, gave a very interesting lecture on Tuesday, November 15, on "Some of Nature's Peculiarities." Mr. Kettle is a very keen observer, and has, for many years past, studied the peculiarities of plant and insect life. Mr. W. Reeves presided.

The lecturer referred to the fact that palms and other kinds of plants grew so freely near the seashores of the islands in the Malay Archipelago, and said that seeds were washed from one island to another, and in this way the distribution was continuous. He also drew attention to the night-opening flowers, saying that they were nearly all white, or very light-coloured, so that insects could see and fertilise them. Mr. Kettle said wasps brooded in the latter part of the season were all fertile queens, and they ate green aphides freely. He had watched them in his houses doing so. The pitcher plant obtained its nitrogen in its native home from the dead insects caught in the pitcher-like end of the leaf. The insects could easily crawl in, but could not as readily get out again, because the inside of the pitcher was coated with innumerable fine spines, which all pointed downwards. Thus the dead insects furnished the necessary nitrogen for the plant. The frogbit, a water plant, had roots which went straight down in the water, but only in shallow water did they reach the bottom. In summer time the plants, in masses, floated away in the streams; they possessed tiny runners, at the tips of which small buds formed, and these, in due time, became detached, and sank to the bottom—to the mud. When the warm weather again came these buds grew, and so the plant was reproduced. Mr. Kettle further referred to the peculiarities of the

A MAGNIFICENT DISPLAY OF APPLES.
Exhibited by the Government of British Columbia at the R.H.S. Colonial Fruit Show.

roots of plants and trees, and to the multitude of parasites both in the plant and the animal kingdom. He said the roots of the banyan tree not only penetrated the soil from a considerable height, but they also gradually grew out across rivers, and so formed living bridges.

Altogether, the lecture was both instructive and interesting, and an animated discussion followed. Hearty votes of thanks to the lecturer and chairman closed the meeting.

Reading Gardeners' Association.

Notwithstanding the counter-attractions provided by the prospect of a great political contest in Reading, there was again a very large attendance at the Abbey Hall. The Chairman, Mr. T. Judd, presided, and Mr. T. Tunbridge, The Gardens, Three Elms, Henley-on-Thames, was the lecturer for the evening, his subject being "Winter and Summer Pruning." Apart from being one of the oldest members of the society, Mr. Tunbridge is the "bard" of the association, and, as might be expected, his remarks were punctuated by numerous poetic effusions. The lecturer announced that he had no wish to force his opinions on the experienced gardeners among the audience, and his paper would rather be directed to the younger members and to stimulate a healthy discussion at the close of his remarks. Mr. Tunbridge proved himself a thorough master of his subject, and was listened to with profound attention. He certainly had no reason to be disappointed in the discussion which followed the paper, for it proved one of the best debates which has ever taken place in connection with the society's meetings, and went far to prove that on the question of pruning the "doctors" were largely at variance. Mr. Tunbridge was accorded a hearty vote of thanks at the close of the meeting.

Beckenham Horticultural Society.

On Friday, the 25th ult., with Councillor James Crease presiding, Mr. F. P. Giles, of Messrs. Sutton and Sons', Reading, gave a lecture to a good attendance, entitled "One Hundred Years of Vegetable Improvement," illustrated with lantern slides. The cultural side on this occasion was dispensed with, for, as the lecturer remarked, each class of vegetable could more than occupy the time at his disposal. About a hundred slides were shown, and in all cases either the wild progenitors or very early cultivated types were displayed on the screen, and their evolution as depicted proved exceedingly instructive.

A question was put to the lecturer as to why certain peas "were not as good as they used to be " This, in the opinion of the lecturer, was a matter of stocks, and if supplies were obtained from the right stocks they would be as good as heretofore. On the motion of Mr. Thornton, the hon. secretary, a hearty vote of thanks was accorded Mr. Giles for his excellent lecture.

Lee and Blackheath Horticultural Society.

A meeting was held on November 25 at the Church Street Schools, the lecturer for the evening being Mr. W. P. Bound, and his subject "Present-day Orchid Culture." The lecture was well attended, and was altogether a great success, many points of valuable information being gleaned by the audience from so able a lecturer as Mr. Bound undoubtedly is on orchid culture. He dealt in detail with the culture of many species, especially referring to the necessity of syringing growing plants and the need for cutting off all back bulbs, thereby ensuring longer life and increased vigour. He did not recommend cow manure for calanthes, as, in his opinion, it tended to cause long succulent growths, which were not so productive of flowers as the shorter and hardier growths.

The next lecture will be held on December 16, at the Church Street Schools, the lecturer being Mr. F. Philips, hon. secretary of the Reigate Cottage Gardens and Horticultural Society, and the subject "Vegetables."

Bristol Gardeners' Association.

A meeting for "Questions" was held recently at St. John's Parish Rooms. Mr. Hayball occupied the chair. Questions were written on numbered slips of paper, collected, and again distributed, and the replies given by the respective recipients, the Chairman inviting anyone to add to the replies given. The most debated questions were: Name the best and most economical fumigator. What is the best remedy for canker on fruit trees? Why do we earth up potatoes? The cause of apricot branches suddenly collapsing. The best remedy for blight and mildew on roses. The cause of parsnips rotting on the crowns. Is it beneficial to mulch roses in autumn?

For two dishes of apples Mr. Scott was first, Mr. Springham second, and Mr. T. Clark third. A certificate was awarded to Mr. Hookings for another display of chrysanthemums, and three points granted to Mr. Springham for dendrobiums and chrysanthemums.

United Horticultural Benefit and Provident Society.

The November meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, Mr. C. H. Curtis in the chair. Seven new members were elected and one nominated. The death certificate of Mr. A. Miles was produced, and the amount standing to the late member's credit, viz., £8 13s. 3d., was paid to his nominee. The sick list was very heavy, the sum of £66 5s. having been paid for sickness since the previous meeting. Three thousand circulars, putting forth the benefits and usefulness of the society, have been posted to gardeners in the home counties, and the committee hope that many young gardeners as a result will join without delay

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149 Aldersgate Street, London.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

MEDALS AT NORWICH SHOW.—Mr. G. W. Miller, Clarkson's Nursery, Wisbech, writes that he was awarded a silver medal for his group of orchids at the Norwich Show, and not a bronze medal, as stated on p. 942.

PAYMENT FOR GROUPS AT R.H.S. HALL.—T. H., Blackburn: It is not always possible to give answers in the issue immediately following the receipt of the question. A question received late on Wednesday cannot be answered the same week as, except for some very special reason, our pages are closed for the week on Wednesday afternoons. Further, questions may be answered, and the answer in type, and yet be crowded out of an issue by reports of important exhibitions, etc. However, an answer to your question appeared in our issue for December 3, as, doubtless, you have seen.

NEW SEEDLING GRAPE.—A. M., Hull: The grape is a very promising one, but probably it is too like Gros Colmar in general appearance to ever be a great success. It certainly has a better flavour and a less hard skin than the average sample of Gros Colmar, and it appears to colour well. We do not know under what conditions you have grown the vine, but it seems to us that the use of a little more heat would be advisable for the purpose of bringing out the flavour to the fullest degree. We advise you to propagate two or three vines from the seedling and grow these under varied conditions to fully test the value of the variety. Can you tell us what were the parents of your seedling?

PEACHES AND VINES IN SAME HOUSE.—M. C. L., Redditch: Peaches and vines may be grown in the same house, even when planted out, but it is not possible to secure the highest success with either peaches or grapes when these are grown together, because the best conditions for each differ so much at certain seasons. If the peach trees are at one end of the house and the vines at the other, then put a partition across the house between the two crops. With extra valves in the pipes to adjust the heat there should be no difficulty, as to all intents and purposes there would be two houses, one for the peaches and one for the vines. The present season offers a good opportunity of making this alteration.

CAULIFLOWERS.—C. P., Leyton: Give the plants frame protection, but also afford them ample ventilation during all but the severest weather. During prolonged severe frost the frames must be covered unless they contain a row of hot-water pipes that will give just sufficient heat to keep the interior of the frame above freezing point in such a period.

SCOTTISH HORTICULTURAL ASSOCIATION.—A. M., E., Berwick: The objects of the Association are the promotion and advancement of Horticulture in all its branches, and the dissemination of a knowledge of such branches of Science and Art as are connected therewith. Any person interested in the objects of the association is eligible for membership. Ordinary meetings of the association are held at 5, St. Andrew Square, Edinburgh, at 7.30 p.m., on the first Tuesday in each month, excepting January, in which month the annual business meeting is held. A member is entitled to introduce a friend at any of the ordinary meetings. The annual subscription is two shillings and sixpence, payable in advance, on January 1 in each

year. A new member's subscription becomes due on the date of election. Any person may be elected a life member by a single payment of £2 2s., and an ordinary member who has paid ten annual subscriptions may become a life member by a payment of £1 1s. The proposer of a member is responsible for the latter's first subscription. The secretary and treasurer of the society is Mr. A. D. Richardson, 19, Waverley Market, Edinburgh.

DOYENNE DU COMICE PEAR.—E. J. S., Hurstmonceaux: This delicious and very valuable pear was raised in the garden of the Comice Horticole, at Angers, where the original tree first fruited in 1849. Doyenne du Comice is among pears what Cox's Orange Pippin is among apples—the best dessert variety.

WINTER HELIOTROPE.—G. B. T., Durham: The Winter Heliotrope is Petasites (or Tussilago) fragrans, and is a fairly common wild plant in many parts of the country, being frequently found on the higher banks along the Thames Valley, for instance. It is difficult to eradicate once it is established, and therefore in a garden it must be kept within bounds. It flowers in January and February, and its erect spikes of whitish or pale lilac flowers are very fragrant. Some strong crowns should always be potted up as early as possible in the autumn, and kept in a cold frame until the spikes begin to push up, when they should be removed to the greenhouse or conservatory to develop. The Winter Heliotrope is not particularly attractive, but a few plants in flower will disperse a delightful fragrance throughout the conservatory.

BLADDER FERNS.—W. D., Monmouth: The Bladder Ferns are Cystopteris alpina, C. montana, and C. fragilis; they are very beautiful, and deserve cultivation in a moist shady place, where they are sheltered from strong winds and heavy rains.

NAMES OF PLANTS.

W. H. B., Bristol.—1, Maxillaria picta; 2, Asplenium Nidus; 3, Ficus Parcelli.

G. W., Harrow.—1, Cypripedium Leeanum—a fine form; 2, no, not C. villosum, but the hybrid known as J. Howes.

D. M. M., Hever.—1, Quercus Ilex; 2, Berberis Lycium; 3, Phillyræa media; 4, Berberis angulosa; 5, Ligustrum lucidum variegatum.

A. L., Weybridge.—1, Cattleya labiata; 2, Epidendrum cochleatum; 3, Cattleya Bowringeana; 4 and 5, are infertile specimens; send us full-sized fronds at some later date; it is a pteris, and is probably a Doodia.

F. E. C., Harpenden.—1, Cupressus Lawsoniana Allumi; 2, Abies Nordmanniana; 3, Schizostylis coccinea; 4, Rhododendron hirsutissimum; 5, Ramondia pyrenaica (this is probably correct, but, as there are no flowers at present, the plant may represent the white form of the species).

NAMES OF FRUITS.

L. S., Carlisle.—1, Bramley's Seedling; not recognised.

W. W., Littlehampton.—1, Beurre Diel; 2, Beurre Rance.

S. B. F., Cheltenham. — A very small Doyenne du Comice.

C. F. A., Sevenoaks.—1, Tower of Glamis; 2, Bramley's Seedling.

S. H. R., Skipton.—1, Dumelow's Seedling; 2, King of the Pippins.

F. H. C., Bedford.—1, Sturmer Pippin; 2, Golden Noble; 3, Newton Wonder; 4, Fearn's Pippin.

P. T., Warwck.—1, The Queen; 2, Baumann's Red Winter Reinette; 3, Cox's Orange Pippin.

FORTHCOMING ENGAGEMENTS.

TUESDAY, December 13.—Perpetual Flowering Carnation Society's Winter Show at the Royal Horticultural Hall.

THURSDAY, December 15.—Annual Meeting of the National Sweet Pea Society at the Hotel Windsor, commencing at 3 p.m.

TUESDAY, December 20. — Royal Horticultural Society; the Committees will meet at 12 o'clock to consider novelties, but there will not be the usual exhibition.

NOTE OF THE WEEK.

National Rose Society.

Although the number of members present at the annual meeting of the National Rose Society held on the 8th inst. was somewhat below the high average of the past few years, it was by no means small, and there was certainly no lack of interest in the proceedings. It may be that the elections or the unfavourable weather have influenced the attendance; and it is just possible, as is so often the case when a society is in a flourishing state, some members who have usually attended considered it unnecessary to make a long journey for the purpose of taking part in the proceedings. Whatever may have been the cause of a slight falling-off in the numbers present, more than enough members assembled to show that an immense amount of interest is being taken in the society and its work, and it may be added the proceedings were as usual of the most pleasant character. It would have been surprising had they been otherwise on this occasion, for the Council were able to show in the report presented to the meeting that the year had been one of progress. There had been a large accession of new members, much useful work had been accomplished, and the finances in every way satisfactory. For the first time in the history of the society the Council were able to report that over 1,000 members had joined during the society's financial year, and that the membership is now 4,500 in round numbers, these figures representing a net gain of about 750 members. Mr. G. W. Cook, the treasurer, was able to present a financial statement showing that, with the balance of £427 8s. 8d. from the previous year, the income amounted to £3,404 14s. 4d. Of this amount the sum of £2,299 16s. 6d. was received as subscriptions, and the proceeds of the Metropolitan shows and the contribution of the Wilts Horticultural Society to the provincial exhibition amounted to £320 6s. 6d. The last figures represent a decrease of about £100 as compared with last year, and this falling-off was largely, if not wholly, due to the wretched weather experienced on the day of the Metropolitan show. The principal disbursements were about £1,000 in cash prizes, medals, and plate, £725 10s. 9d. for publications, and £469 16s. 6d. expenses at shows. The Council added £250 to the reserve fund, which has cost the society £1,000. It is so common a practice for horticultural and floricultural societies to carry on their work without a reserve fund that so large a sum as £1,000 appears to be giving rise to a little uneasiness in the minds of some of the members, and it was suggested in the course of the proceedings that with so large a sum invested the Council should devise some additional method of promoting the development of the rose and its cultivation. The suggestion, we are pleased to say, did not find much favour; in fact, there was a remarkable consensus of opinion that for the present it would be wise to refrain from increasing the expenditure to any appreciable extent. It should be remembered that the sufficiency or otherwise of a reserve fund, does not depend upon the actual amount, but upon the proportion it bears to the annual revenues. If this test is applied it is difficult to avoid the conclusion that the reserve fund should be at least £2,000. With so substantial a sum as this in reserve the Council will be able to make new departures with a view to increase the usefulness of the society, and maintain its high position during a year or so of depression should it be experienced. We are suggesting this as an act of common prudence, and not because we are apprehensive as to the future of the society. There is certainly no cause for apprehension, for during the thirty-four years of its history its progress has been continuous. The splendid success achieved by the society is somewhat of a surprise to many who are concerned with the management of associations that have for their object the advancement of horticulture, and we are frequently asked whether it is possible to assign the cause. There is really no difficulty in the matter. The Council, which includes all classes of rosarians, recognises the fact that the object of the society is to extend and improve the cultivation of the rose, and that to accomplish this, the members must be encouraged by means of exhibitions to grow their roses to the highest degree of perfection, and be assisted by means of literature of a useful character, and differing from that obtainable in the usual course. Annually a large sum is expended upon literature, with the result that all the members have in addition to the right of competing at the exhibitions a substantial return for their subscriptions. The importance of this policy is confirmed by the evidence derived from the National Sweet Pea Society, which held its annual meeting on Thursday, and ranks among special societies as second only to the National Rose Society. These two societies agree also in limiting the number of consecutive years during which the presidents hold office, and in both the innovation upon the old practice has been highly successful. In the National Rose Society two years is the limit, and since the death of Dean Hole there have been three presidents, all of whom have done splendid work, and the Rev. J. H. Pemberton, who was elected to succeed the Rev. F. Page Roberts, has shown such marked ability as a vice-president as to prove to demonstration his special fitness for the presidential chair. In presiding at the conversazione which followed the annual meeting, Mr. Pemberton was particularly happy, and contributed in no small degree to the enjoyment of those who were present at this pleasant function, which is becoming increasingly popular.

MR. W. MEASE.

Mr. W. Mease, whose portrait we give in this issue, has long occupied a prominent position among practical horticulturists, and enjoyed the esteem of those who have had opportunities for becoming acquainted with him and his work. We first became acquainted with Mr. Mease when he was in charge of the gardens of Wyncote, Allerton, Liverpool, the residence of the late W. C. Neumann, Esq., and we were much impressed by the evidence these gardens afforded of his skill in the cultivation of the various classes of plants that have a place in an establishment of the first class and of fruit and vegetables.

We have also had occasion to admire the many fine specimens with which he has obtained distinction at the Liverpool flower shows, and, indeed, at other of the northern exhibitions. While at Liverpool Mr. Mease specially distinguished himself as a cultivators of chrysanthemums, and then as now, his flowers were characterised by high quality. Probably, his most notable achievement as an exhibitor of chrysanthemums while at Wyncote, was the winning at Hull in 1887 of the valuable challenge vase and £15 in cash offered for 48 blooms of incurved and Japanese varieties in equal numbers. About two years after this event Mr. Mease was engaged by Alfred Tate, Esq., as gardener at Downside, Leatherhead, and here as at Wyncote, he has given proof of his remarkable abilities. He has necessarily taken an active part in the formation of the extensive and beautiful rose garden which Mr. Tate has created, and the herbaceous borders and other features for which the Downside gardens are famous. We need not refer to the success with which roses are grown at Downside for that is well known, and it is a matter also of common knowledge that Mr. Mease has maintained his position as a cultivator of chrysanthemums, one of his latest successes being the winning of the premier award in the principal class for incurved varieties at the exhibition of the National Chrysanthemum Society last month.

International Horticultural Exhibition, 1912.—The first provisional schedule of the International Horticultural Exhibition to be held at Chelsea in 1912 is on the point of being issued, and will be found of interest, as indicating the character of this great gathering. It requires a closer examination than is now possible for us to give it, and for the present it must suffice to say that the schedule contains 431 classes arranged in twelve divisions. There are: 1, stove plants, (a) groups, (b) specimens, (c) cut flowers; 2, palms, cycads, etc.; 3, orchids; 4, ferns and selaginellas; 5, greenhouse plants, (a) groups, (b) specimens, (c) cutflowers; 6, roses; 7, carnations and pinks; 8, hardy plants, (a) groups, (b) specimens, (c) cut flowers; 9, new plants; 10, fruit; 11, vegetables; 12, miscellaneous. No prizes are yet allocated to the respective classes, but it is stated in a note that the Executive Committee have adopted the following resolutions with regard to them: (1) That the system of prizes adopted should consist in a combination of silver (or silver-gilt) cups and money, together with a diploma. (2) That a single form of cup be adopted and made in a variety of sizes to suit the larger and smaller classes and merits. (3) That the cup adopted should always be engraved with the seal or other official badge of the Exhibition Committee. The schedules may be obtained on application from Edward White, Esq., 7, Victoria Street, Westminster.

New Victoria Medallists of Honour.—The President and Council of the Royal Horticultural Society have conferred the Victoria Medal of Honour in Horticulture on Mr. John C. Cypher, Mr. Thomas Coomber, Mr. C. R. Fielder, Mr. H. B. May, and Mr. A. H. Pearson, all of whom we need hardly say, are in every way worthy of this distinction. Mr. Cypher, whose portrait we had the pleasure of giving in our issue of the 10th inst., has specially distinguished himself as a cultivator and exhibitor of orchids and stove and greenhouse plants, and in the art of plant arrangement. Mr. T. Coomber, who for many years past has been in charge of the Hendre Gardens, Monmouth, is one of the best-known gardeners, and has attained a high degree of fame as a cultivator of fruits, both in the open and under glass. Mr. C. R. Fielder is chief of the extensive and beautiful gardens of North Mymms Park, and, by reason of the excellent work he has accomplished in various directions, occupies a deservedly high position among practical horticulturists. Mr. H. B. May, who is a member of the Council of the Royal Horticultural Society, is one of the more prominent commercial horticulturists, and, as chairman of the Royal Gardeners' Orphan Fund, he has rendered services in the cause of charity on which it would be difficult to place too high an estimate. Mr. A. H. Pearson is a member of the firm of Messrs. J. R. Pearson and Sons, Lowdham, and has throughout his business career devoted special attention to hardy fruits, on which he is a high authority. Mr. Pearson was for many years a member of the Royal Horticultural Society's Council. We have given the portraits of all these gentlemen, and, with the exception of Mr. Coomber, within a comparatively recent period.

Plant Physiology and Pathology.—A Chair of Plant Physiology and Pathology has been founded in connection with the Imperial College of Science and Technology at South Kensington, and at the recent meeting of the Governing Body it was resolved to invite Professor Friedrich Czapek, of the Prague University, to accept the Professorship, and to at once make the necessary preparations for providing the accommodation required for the new department. Professor Czapek enjoys a high reputation as an authority on the physiology and pathology of plant life, and has devoted special attention to the bio-chemical aspect of these two important subjects.

Chrysanthemum Shoreham Pink.—We are informed by Mr. R. A. Witty, secretary of the National Chrysanthemum Society, that at the recent meeting of the Floral Committee of the society, it was agreed that the name of the single variety which received a first-class certificate on November 21, as Pink Delight should be altered to Shoreham Pink.

Kew Bulletin.—The current issue (No. 9, 1910) is of much interest to botanists and practical horticulturists. It contains, among other subjects, a paper by Mr. G. Massee, on the Crown Gall disease, and a descriptive list of the hybrid plants raised at Kew. The list is a rather lengthy one, and includes begonias, calceolarias, cheiranthuses, cytisus, disas, gladioli, primulas, rehmannias, rhododendrons, senecios, strelitzias, and streptocarpus. There is a short list of crosses that were made, but were unsuccessful, among them being Primula sinensis x P. obconica, P. sinensis x P. verticillata, P. sinensis x P. vulgaris, P. obconica x P. malacoides, and P. obconica x P. megaseæfolia. There is also an interesting paper on Agave lurida from the pen of Mr. J. R. Drummond.

Honour to Mr. E. Mawley, V.M.H.—The decision of the Council of the National Rose Society to confer upon Mr. E. Mawley, V.M.H., the Dean Hole Medal, which was founded a few years ago for the recognition of special services rendered in the cause of the rose and its cultivation, was a highly popular one with the members present at the annual meeting, which was held at the Westminster Palace Hotel on the 8th inst. The announcement that the Council had conferred this honour upon Mr. E. Mawley evoked the warmest expression of approval, and when he rose to receive the medal from the Rev. F. Page-Roberts, the retiring president, the outburst of applause was such as to show that Mr. Mawley's long and arduous labours as honorary secretary of the society are fully appreciated by the members. The fund which bears the cost of this medal was raised as a memorial to the late Dean Hole, and the first recipient was the Rev. J. H. Pemberton, the new president of the National Rose Society, who was presented with it at the annual meeting last year.

Horticultural Educational Exhibition and Conference, 1912.—The Executive Committee of the International Horticultural Exhibition, to be held in 1912, announce that they are especially desirous of holding a Horticultural Education Exhibition and Conference in conjunction with the main exhibition for the purpose of drawing attention to the wonderful improvements that have been effected in plants during recent years, and to the different ways and methods by which the improvements have been obtained. Also to bring into prominence the different methods of training young horticulturists in this country, on the Continent of Europe, and in America, and the excellent work that is being done by horticultural instructors working under the different County Councils. A strong committee, it may be added, is being formed for the purpose of carrying out the details of the conference.

Wimbledon Common Extension.—We regret to learn that an endeavour is to be made by the more extreme members of the Wimbledon Town Council to have rescinded the resolution by which that body, in accordance with the almost unanimous vote of the ratepayers at a town's meeting, agreed to contribute £10,000 to the fund for the extension of the Wimbledon and Putney Commons. Councillor E. E. G. Williams, one of the recently appointed members of the Council, has given notice that he will move: "That, in view of the fact that support was given to the proposal for contributing out of the rates to the Wimbledon Common Extension Fund on the understanding that the Surrey County Council would also contribute, and that the Surrey County Council has now declined to contribute, this Council will not proceed further with the proposal for a contribution from the rates of Wimbledon, and hereby rescinds the resolution of October 26, 1910." To meet the objections of some South Wimbledon opponents to the scheme, Mr. Richardson Evans, the hon. secretary to the fund, has offered to defray the expenses of holding a public meeting in the south to discuss the scheme and also the Council's contribution.

Yorkshire Gala.—The schedule of prizes offered for competition at the horticultural exhibition to be held at York on June 14 and two following days has been issued, and is as usual comprehensive in scope, and the prizes are liberal. There are two classes for groups of miscellaneous plants in or out of bloom, and in that for groups occupying an area not exceeding 300 square feet the prizes aggregate £70, and in that for groups occupying an area not exceeding 200 square feet the prizes amount to £34. The class for a group of hardy plants and flowers with a background of decorative plants, bamboos, etc., with a pool of water containing nymphæas and other aquatics, should be remarkable both for its interest and attractiveness. The prizes aggregate £40, and prizes amounting to £25 are offered for a display of hardy flowers. The classes for tables of plants and cut flowers and orchids should also form attractive features, and it would be well were such classes to be included in schedules more frequently than is at present the case. Roses, carnations, fruits, vegetables, and indeed nearly all the principal subjects available for exhibition in June have liberal provisions made for them, and four gold medals will be awarded to nurserymen's collections contributed to the non-competitive class.

Metropolitan Open Spaces.—At the December meeting of the Metropolitan Public Gardens' Association, it was agreed to lay out the eastern portion of Bow Churchyard if its maintenance could be secured. Progress was reported with regard to schemes for the acquisition of the Ironmongers' Almshouses and Garden, Shoreditch, the money required in this case having been practically secured, and for the extension of Wimbledon and Putney Commons and the purchase of portions of the Grange estate, Kilburn. A letter was read from the Council of the Royal Borough of Kensington stating that they were again desirous of utilising the services of the association in superintending the pruning and lopping of the trees in the streets and roads of the borough, and it was agreed to accede to this request. A grant of £105 from the Drapers' Company was announced.

November in the North.—The outstanding feature of the weather experienced during the past month has been the abnormal rainfall. Without the city proper, writes our Aberdeen correspondent, the quantity of rain, sleet, and snow that fell was fully 6 1-3 inches, which, with one exception, that of 1905, when it was exactly 6½ inches, is the largest recorded during the last 40 years. The average rainfall in November for the last 40 years is fully 3 inches, the lowest being in 1881, when it was rather less than 1 inch. We had snow on four days, but slight; the ground being partially white on the 12th, and again rather more so on the 16th, and still more so again on the 19th, when we had fully an inch of snow, which lay all next day but had disappeared by the afternoon of the 21st; and there was sleet on other three days. We had frosty mornings on at least 12 days, and perhaps more faintly on a few others, but we experienced no severe or steady frost. The greatest rainfall was on the 7th, when fully an inch was registered, and the rivers were in flood. Rain fell in measurable quantities on at least 16 days, with the result that the land has been so wet as to seriously affect the work on the farm. The wind blew oftenest from the north-west, with an occasional veer to south-east, but there were many quiet days, and some even quite calm, and an entire absence of strong gales. The temperature was generally low or chilly, except in the sun, with a cloudy sky on some 12 or 14 days, and a good deal of sun on about the same number.

Peter Barr Memorial Fund.—Bearing in mind the considerable sum of money that would have to be invested for the purpose of providing a gold Peter Barr Memorial Medal annually, to be awarded in connection with work among daffodils, the Executive Committee of the above fund recently resolved to obtain a Peter Barr Memorial Cup, to take the place of the proposed medal, and to be held for one year by the person honoured. This will still carry out the principle of the original idea, it will obviate the necessity of forming a memorial trust, and will permit of a larger sum being handed over to the Royal Gardeners' Orphan Fund. The Barr Memorial Fund will not be closed immediately, therefore those who have not already dore so are invited to send their subscriptions to the treasurer, Mr. H. B. May, V.M.H., Chingford, Essex.

MODERN COMMERCIAL FRUIT CULTURE.

(Concluded from page 978.)

Diseases

Unfortunately, with the growing number of orchards and fruit plantations there has come the liability of diseases taking almost an epidemic form. In the old days if disease broke out on a farm, it was, comparatively speaking, isolated, but now, with so many farms and orchards close to each other, as well as the practice of general sale and exchange of fruit tree stock, disease is much more difficult to confine to the original outbreak. Every fruit grower knows, for instance, how easy it is to introduce mussel scale and American blight into the orchard by means of some trees bought, perhaps at some fruit tree sale, or obtained from a nursery where they were not careful to keep the nursery stock clean from these pests.

Notwithstanding the many County Council experimental gardens, research departments attached to horticultural colleges, as well as private experimental places like Woburn, all of them at work on the problems besetting fruit culture, there are several diseases of which no cure, certain or practicable, has yet been found.

Take the silver leaf disease attacking plum trees. It is only within the last ten years that this disease has assumed the proportions it now has, yet it now increases with such virulence that whole orchards are infested with it, and all the hope one of our best investigators can give is, that some affected trees may recover, and some badly affected will die; that all remedial measures, such as inoculating the trees with sulphate of iron, or dressing the surrounding soil with it, are of little, if any, avail; that the only thing to do is to keep the trees in a healthy condition, and (I suppose) cut out all dead wood. Here is a fungus fruiting on any dead wood, not only of fruit trees, but forest trees as well, whose myriads of dust-like spores are capable of infecting any tree, apple or plum, on which there is a wound by which they can obtain entrance. Think what this means on trees which, of necessity, have to be pruned, and, in some cases, have the lower boughs sawn off; what labour is involved in protecting the cuts with an antiseptic paint of some sort—the only course to take where the disease is present.

Take another case—the gall mite in black currants, causing the big bud disease. Here is a pest which has had the effect of wiping black currant growing out in some districts, and bids fair, unless some remedy is shortly found, to put a stop to the industry all over the country. Yet, in the face of it, we are absolutely powerless, with no remedy save the precautionary measure of procuring clean stock of varieties least liable to the disease, coupled with hand picking of the affected buds when few, and the destruction of the bushes when this course becomes ineffectual owing to the numbers.

These are only two out of a number of diseases against which we have no remedy that is really practicable and effective. Others are the brown rot of apple, plum, and cherry; "die-back" disease of gooseberries; botrytis fungus, attacking all sorts of fruits, particularly raspberries and loganberries. Even with those diseases for which spraying is the accepted remedy the trouble does not end then, for spraying is a very expensive business, and one requiring a great deal of skill and attention, and it is easily possible to spend more in this way in materials and labour than the fruit is worth when matured. So great has been the want of success with spraying, partly from the faults of the fruit grower and his employees, and partly because far too much is claimed for the various specifics by their makers, that there is a serious danger of a revolution on the part of fruit growers from a feeling in favour of spraying to a distinct opposition to it for any and every purpose.

As I said before, to my mind these various diseases now attacking all the various fruits we grow, with more or less severity, make all the difference between profit and loss in fruit growing; further, it often depends upon one's quickness in discovering the outbreak at the very first, and taking prompt measures in dealing with it, whether one is successful in fighting the disease or not. This continued fighting with adverse circumstances of diseases and so on calls for traits of character uncalled for in the past, when the margin of profit was much higher and allowed for greater losses.

In the first place, the successful fruit grower of to-day must be a keen business man, able to seize advantages of buying in the cheapest market, of disposing of his produce to the very best advantage; he must be a good manager of men, able to control them well, and get the best results possible from their labour. Further, he must be endowed with the keenest observation to detect at once the outbreaks of disease,

A considerable knowledge of botany, chemistry, and zoology, among the sciences, as well as some knowledge of mechanical engineering are necessary equipments, unless he wants to pay considerably for expert assistance in these days of spray fluids and spraying machinery, and intensive manuring. Even with all these qualities, with much capital invested, and working hard at his business from daylight till dusk, it is often probable that he earns such interest on his capital and return for his labour as would be considered wholly inadequate in many a commercial pursuit.

What the industry wants in my opinion, is, first, a stop put to the reckless journalism, which magnifies profits without giving any hint of difficulties, so as to check the rush into fruit growing of people who are totally unfitted for it, and who only serve to throw more medium fruit upon an already overstocked market; secondly, cheapening of cost of transport, etc., so that the cost of distribution is not so great, and that the price paid by the consumer should not be quite so disproportionate to the price received by the grower, as at present; lastly, and perhaps the most important point of all, more sympathetic assistance from the State.

The Board of Agriculture is not, and cannot be, under present arrangements, of much use to horticulture. What is required is either an entirely separate set of officials under the present Board, or the formation of a distinct Board of Horticulture. Further, the officials should be practical men, in intimate acquaintance with all the various industries connected with horticulture, not bureaucrats, inseparably connected with red tape and sealing wax. There should be State experimental orchards and gardens all over the country, under charge of skilled experimenters and scientists, to investigate the problems which beset growers, and strive to find means to overcome them, not to carry out freak experiments of no value to the industry, as often happens nowadays.

FRANK HAMMOND.

PERPETUAL CARNATION SOCIETY.

There was an extremely beautiful display of perpetual carnations at the Royal Horticultural Hall on Tuesday, December 13, on the occasion of the above society's winter show. The competition was about on a par with previous efforts, but the quality of the flowers showed a distinct advance. There was a falling off in the trade displays, due chiefly to the lateness of the date, as at the present time most growers need all their flowers for the supply of the market. The show was very well managed, Messrs. H. Mathias, Brunton, and Hawes all fulfilling their duties admirably.

OPEN GENERAL CLASSES.

For the best three vases, twelve blooms of each, of British novelties, Mr. C. Engelmann won first prize with good examples of Carola, Rex, and Harlequin; Mr. Lancashire came second with Emperor, Carola, and Rose Doré. The American Challenge Cup for three vases of American varieties was won by Mr. W. E. Wallace with Dorothy Gordon, May Day, and Pink Delight, the latter a delightful variety; Mr. C. Engelmann second with Pink Delight, May Day, and Afterglow.

The Covent Garden bowl and silver-gilt medal, offered for two varieties of market carnations, each represented by a box of twenty-four blooms, packed for market, and a vase each of thirty-six blooms, produced a fine competition between three growers. Mr. W. E. Wallace, Eaton Bray, won the coveted award with superb flowers of Delight and White Perfection—a beautiful exhibit. Mr. C. Engelmann won second prize with Carola and Regina.

LARGE VASES, OPEN CLASSES.

In the open classes twenty-five blooms had to be shown in each vase, one variety only. For a vase of Enchantress, or variety of similar colour, Mr. W. E. Wallace, Eaton Bray, scored with superb flowers of Enchantress; Mr. G. Lange, Hampton, second; and Baroness Mdme. de Brienen (gardener, Mr. L. J. Harrison), Clingendaal, The Hague, third, each with Enchantress. In the class for Mrs. Burnett or similar variety, Mr. W. E. Wallace led with Delight, and was followed by Mr. Engelmann, who showed a seedling, and Mr. W. H. Lancashire, Guernsey, who came third with Mrs. H. Burnett. There were five entries of Rose Pink Enchantress or similar variety, and here Mr. W. E. Wallace was first with blooms of superb colour; Mr. G. Lange second, and Mr. Lancashire third, all showing Rose Pink Enchantress. For a vase of blooms of the Lawson type Mr. Lange scored with Mrs. C. W. Ward, Mr. Engelmann coming second with Rosa.

In the scarlet class there were five competitors, and Mr. Wallace was again to the front, this time scoring with Britannia; Mr. W. H. Lancashire second with a splendid vase of Beacon, and Mr. G. Lange third with Scarlet Glow. There were five entries of white varieties, and here Mr. Lange scored with White Perfection in good style; Mr. Wallace second with White Enchantress, and Messrs. W. Wells and Co. third with White House. The best twenty-five flowers of a crimson variety were of Carola, shown by Mr. C. Engelmann, Saffron Walden; Mr. Lancashire second with President. The best twenty-five blooms of a self of any other colour than that already specified, came from Mr. Lancashire, who exhibited Mikado; Mr. C. Engelmann second with the same variety. For a vase of a fancy variety, Mr. C. Engelmann led with bright blooms of the attractive red and yellow Harlequin; Mr. Lancashire second with Emperor.

Mr. H. Burnett, Guernsey, led for a variety not yet in commerce with an unnamed large-flowered rose-pink variety; Messrs. W. Wells and Co., Merstham, second with White House. The best dozen blooms of J. Whitcomb Riley came from Mr. W. E. Wallace, who won the chief prize given by Messrs. E. G. Hill and Co., Richmond, Indiana, U.S.A.; Mr. G. Lange and Mr. C. Engelmann were placed equal second for this yellow variety. Messrs. F. Dormer and Co., La Fayette, Indiana, U.S.A., gave prizes for Scarlet Glow, and these were won in order by Mr. W. H. Lancashire, Mr. W. E. Wallace, and Mr. G. Lange.

FLORAL ARRANGEMENTS, GROUPS, AND PLANTS.

Baskets of carnations were particularly beautiful, and premier award was easily won by Messrs. R. Felton and Son, Hanover Square, W., with a delightful basket of Britannia and White Perfection; Mrs. K. F. Hammond, King's Road, Sloane Square, second; and Mrs. Alex. Robinson, Norhyrst, Park Hill, Carshalton, third. There were six competitors in the class for a dinner-table decoration of carnations, and here Mrs. A. Robinson, who used Enchantress blooms, and had a rather novel low centre, was first; Mr. F. G. Bealing, Bassett, Southampton, second, with an arrangement of the Mrs. Burnett variety; and Miss F. Museuth, Church Street, Wolverhampton, third.

Premier award for a vase of thirty-six blooms, any one or more varieties, arranged for effect, was won by Mr. W. E. Wallace, who staged a lovely vase of May Day and Carola, thus winning the piece of plate offered by Mr. Felton; Mr. H. J. Dudney, Erith, second; and Mr. H. Burnett third. Messrs. R. Felton and Son scored for a bouquet of carnations, with Mrs. K. F. Hammond, Sloane Square, S.W., second, and both used the variety Mrs. H. Burnett. Mrs. Hammond led for gentlemen's buttonhole bouquets; Mr. A. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, Shenley, second; and Mr. Johnson, gardener to Lord Burnham, Hall Barn, Beaconsfield, third. The Messrs. Felton led for ladies' sprays, followed by Mrs. Hammond and Mr. Bealing.

There was but one entry in the class for a group of perpetual carnations, and this was set up by Mr. P. Wilkinson, gardener to Sir Daniel Gooch, Bart., Hyland's Park, Chelmsford, who now holds the Lord Howard de Walden silver-gilt cup for the ensuing season. The display was a fairly good one, and well arranged. Mr. A. E. Usher scored for six plants with finely-grown specimens; Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, second. Mr. Usher also led for three plants, and was followed in order by Mr. A. Grubb and Mr. Vert; a capital and useful class.

AMATEURS.

In the colour classes, six blooms in a vase, Mr. G. West, The Priory, Old Windsor, led in the Enchantress class, with Mr. Usher second, and Mr. Grubb third. In the Mrs. Burnett class, Mr. J. Vert won first prize, with Mr. Usher second, and Mr. Johnson third, all showing Mrs. Burnett. In the rose-pink class Mr. J. Vert led, with Mr. Usher second, and Mr. Paskett, gardener to E. J. Johnston, Esq., Burrswood, Groombridge, third, all showing Rose Pink Enchantress. For flowers of the Lawson type Mr. J. Vert scored with Superior; Mr. Usher second with Enchantress; and Mr. Johnson third. In the white class Mr. Usher came to the front with the beautiful White Perfection; Mr. Vert second with White Enchantress, and Mr. Paskett third. The class for scarlet flowers brought out seven competitors, Mr. Usher scoring with Britannia, and followed by Mr. G. Johnson and Mr. G. West. Mr. Usher was to the front in the crimson class with Carola; Mr. Vert and Mr. Grubb second and third respectively. For any other self colour, Mr. Usher led with the pretty Rose Doré, and in the fancy class the same competitor scored with Imperial.

Dr. Kyffen's prizes for a dozen blooms in not less than six varieties, were won in order by Mr. J. Vert, Mr. A. E. Usher, and Mr. G. Johnson, each of whom showed well. The Engelmann Challenge Cup, six flowers of Carola or Vinca, or the two mixed, was won by Mr. Usher with particularly fine examples of Carola; Mr. Grubb second, and Mr. P. Wilkinson third. For the best bloom with long stems of Carola, the prizes fell respectively to Messrs. Usher and G. Boyd, and for the best bloom with long stem of Vinca, Messrs. Usher and F. May won the awards. Mr. T. H. Plowright, Trinity Place, Windsor, had the best three flowers of May Day, the best three of Winsor, the best three of Mrs. T. W. Lawson, the best three of White Lawson, and the best three of a scarlet variety—O. P. Bassett. Mr. W. E. Merrett, Atworth, Melksham, scored for the best three flowers of Rose Doré, and the best three of Helen Gould.

There was, unfortunately, only one exhibit of a collection of cut carnations arranged on a space 6ft. by 3ft.; this was a beautiful one, set up boldly by Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, and it secured the gold medal and first prize. He had an arch of fine flowers, below which were stands and vases of Enchantress, Harlowarden, Britannia, Winsor, Rose Doré, Robert Craig, and White Perfection. Messrs. S. Low and Co.'s prizes for six blooms of any one or more specified varieties were won in order of mention by Mr. A. Grubb, Mr. J. Vert, and Mr. Usher, the first-named showing Rival. Mr. Burnett's prize for six blooms was won by Mr. Vert with the lovely Mrs. Burnett, while in the maiden class for six blooms Mr. F. Norman, Moor Place, Much Hadlow, led, followed by Mr. F. May, Houndswood, Radlett.

NON-COMPETITIVE.

A grand exhibit was staged by Mr. C. Engelmann, Saffron Walden, across the top end of the hall. Thousands of beautiful flowers were set up in vases of varying size and height, and in tall stands. The central feature was a pyramid of Enchantress, flanked by Elektra Regina and a number of seedlings of heliotrope and yellow varieties. Rex, Winsor, the big Carola, White Perfection, Mikado, Britannia, O. P. Basset, and Scarlet Glow were varieties largely and finely shown on either side beyond the fine central grouping. Mr. H. Burnett, Guernsey, put up a large group of superb flowers, superb in size, substance, and colour. It was a grand exhibit of high-class blooms of R. F. Felton, Mrs. H. Burnett, Britannia, Mrs. W. J. Hunter, Orpheus, Snow Queen, After Glow, Marmion, Mrs. C. F. Raphael, Mikado, White Enchantress, Rose Dore, Mrs. C. W. Ward, and Scarlet Glow.

Facing the entrance Messrs. Stuart Low and Co., Bush Hill Park, Enfield, put up a very elegant and tastefully-arranged exhibit, associating their flowers with palms and ferns. In the central grouping the varieties Mrs. Burnett, the white Marchioness of Linlithgow, and Lady Alington were conspicuous, while in the flanking displays Britannia, Roseate Dawn, Rose Pink Enchantress, J. W. Riley, Regal Mauve, White Perfection, Fire Glow, Mrs. T. M. Crook — crimson, splashed on deep rose—and Colossus attracted most attention. Messrs. W. Wells and Co., Merstham, contributed a group of single and late decorative chrysanthemums. Mr. G. Lange, Hampton, set up about two dozen vases of carnations, the best being Winsor, White Perfection, Mikado, Enchantress, and Admiration.

MEDALS.

Gold.—To Mr. Grubb, gardener to C. E. Raphael, Esq., Porters' Park, Shenley; Mr. H. Burnett, Guernsey; Mr. C. Engelmann, Saffron Walden; and Messrs. Stuart Low and Co., Enfield.

Silver.—Mr. G. Lange, Hampton.

CERTIFICATES AND AWARDS.

British Varieties.—First-class Certificate to Lady Alington, from Messrs. S. Low and Co., Enfield; to R. F. Felton, from Mr. H. Burnett, Guernsey.

Award of Merit.—To Rex, from Mr. C. Engelmann, Saffron Walden; to Mrs. T. M. Crook, from Messrs. S. Low and Co., Enfield.

American Varieties.—These are selected from the whole show by the Floral Committee, and not credited to any particular exhibitor:—First-class Certificates to Mrs. C. W. Ward, Pink Delight, Scarlet Glow, Niagara, and White House.

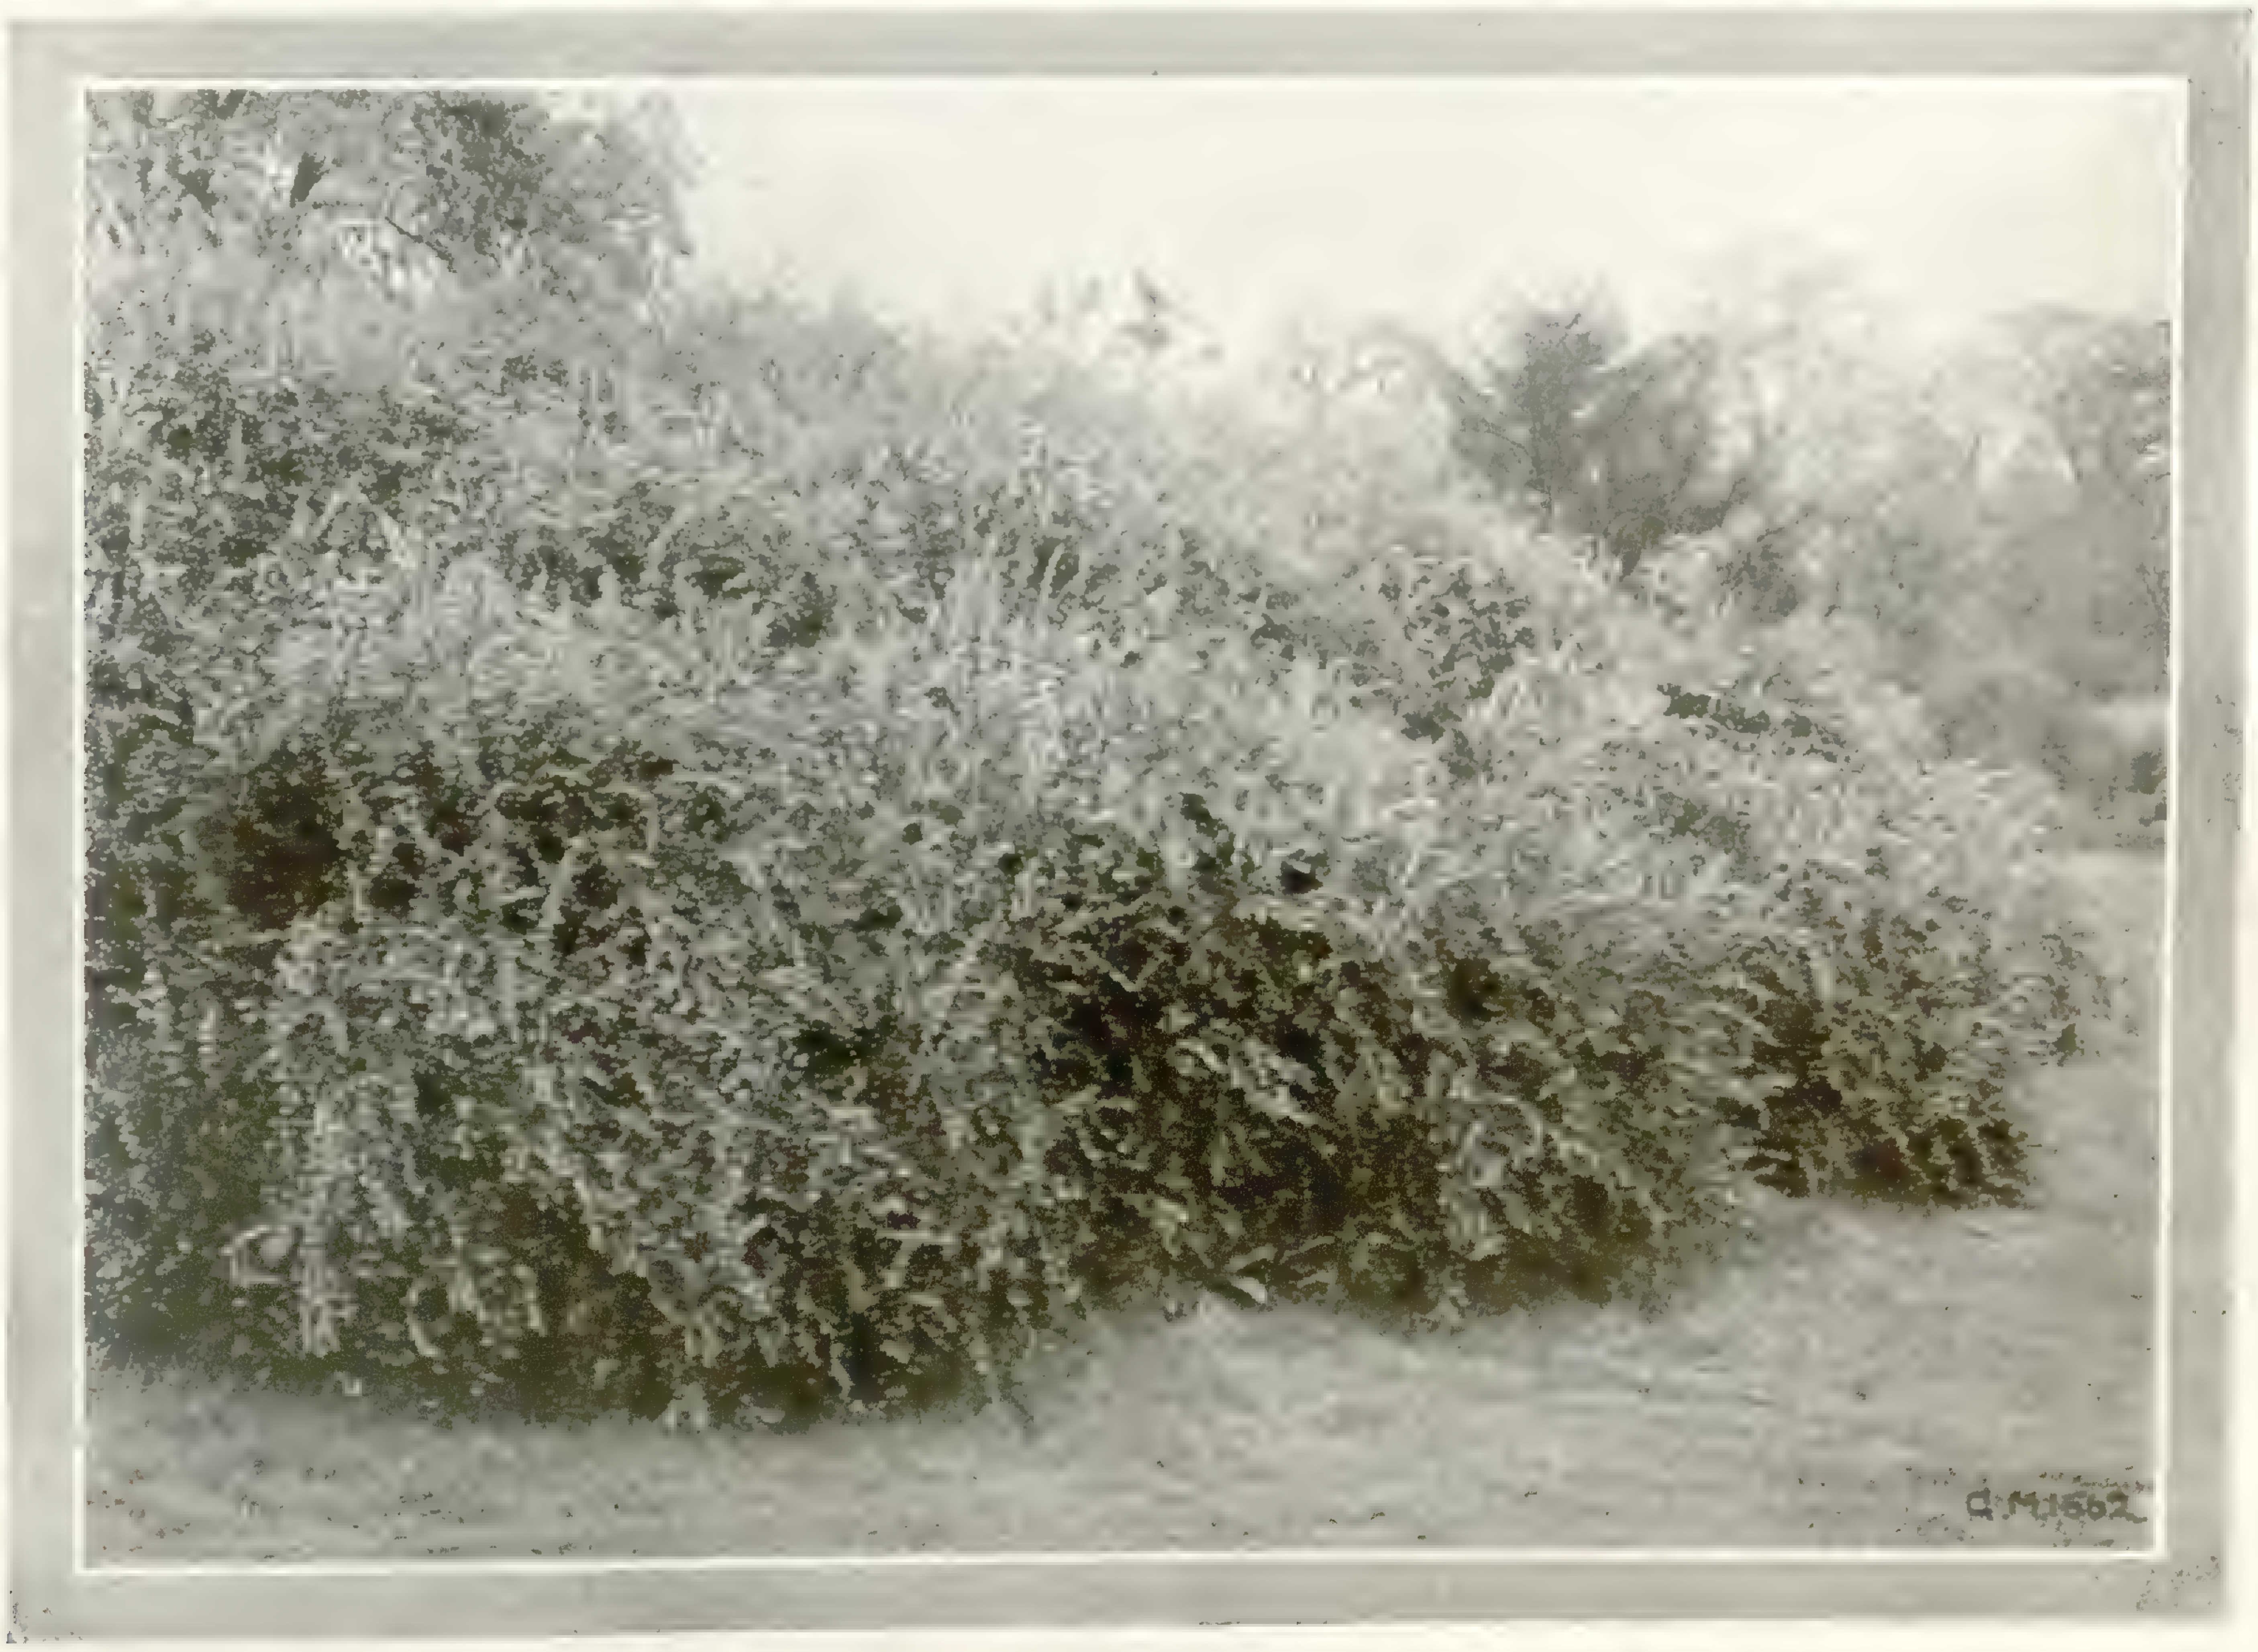
"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

USEFUL AND SHOWY BARBERRIES.

The genus Berberis is made up of a large number of evergreen and deciduous species, many of which are of decorative value, either on account of their showy flowers or fruits, their evergreen foliage, or a combination of all these good qualities. No good purpose would, however, be served by attempting a description of all the species, therefore, in the appended notes, attention is directed to a few of the most noteworthy only.

Barberries are, as a rule, very satisfactory shrubs to grow, for they succeed under very varied conditions, and, though the best results may be looked for from those which are growing in good loamy soil, such is not absolutely essential to success, for fairly good returns may be expected from plants which are growing in poor soil. One kind, B. aquifolium, is an excellent subject to plant beneath trees, for it stands the shade and drip well. On the other hand, it gives excellent results when exposed to bright sunlight.

Taken as a whole, the species give the most satisfactory results when increased from seeds, but kinds like B. stenophylla must be propagated from cuttings, layers, or off-shoots. Cuttings root most satisfactorily when made from pieces of partially-ripened wood four inches or so long during late July and early August, dibbled into a bed of sandy soil in a close but cold and shaded frame. They must be left undisturbed until the following spring when a good idea may be formed of the way the roots are progressing by the appearance or absence of young shoots. When well rooted they may be transferred to nursery borders without delay. In passing in review a selection of the best kinds the following possess merits which warrant them special attention.



A GROUP OF BERBERIS STENOPHYLLA AT KEW.
A fine hybrid bearing a profusion of orange-coloured flowers.

B. stenophylla.

Not only is this the foremost of all the barberries for general decorative worth, but it is one of the best of all flowering shrubs. In the first place, it is a very distinct evergreen, its tiny deep green leaves stamping it as quite different from any other; then there are few shrubs which blossom more profusely, the orange, sweet-scented flowers being borne in racemes from almost every leaf axil on the previous year's growth. In addition, it is of good habit, grows freely, and is suitable alike for a specimen bush in a prominent place on a lawn, a group in a shrubbery, or a large informal mass in park, pleasure grounds or wild garden. The accompanying illustration gives a good idea of the decorative value of the shrub when growing in a large informal mass. The group shown in the photograph may be seen near the flagstaff in the Royal Gardens, Kew, and about the gardens many smaller groups may be noted.

B. stenophylla is of hybrid origin, its parents being the two Chilian species, B. empetrifolia and B. Darwini. Under natural conditions it attains a height of 8ft. or more, and grows into a shapely bush, without pruning. Young plants may be transplanted without trouble, but older examples are difficult to re-establish if they have much root disturbance. The flowering period is April and May, and the blossoms are followed by roundish, blue-black fruits. If seeds are sown, many curious-looking plants may be raised, which show all kinds of leaf variation between the hybrid and its parents. It is, however, rarely that a seedling is raised which approaches B. stenophylla in general worth.

B. Darwini.

This is another barberry of sterling merit. It is a native of Chili, and is distinguished from the last-named by its stiffer and more upright habit and by its rounder and wider leaves with spiny margins. Like the foregoing, it is evergreen and an excellent shrub for lawn or for shrubbery. In point of hardiness it is somewhat inferior to B. stenophylla, though it will grow satisfactorily in all but the coldest parts of the country. As a rule, it is found from six to eight feet high, though on one occasion a plant at Kew, which had been drawn up in a shrubbery, was measured and found to be 18 feet high. The orange-coloured flowers are borne during April and May, and they are succeeded by blue-black fruits which are very conspicuous. Some difference is noticeable in the colour of the flowers for, though the standard colour is a bright orange, plants may be noted with flowers approaching a lemon shade, and others which have almost a scarlet tinge.

B. Wallichiana.

As is the case with the two foregoing plants, this is an evergreen shrub, and is well worth cultivation on that account, as well as for its pale yellow flowers in May and its dark-coloured fruits at a later date. It is a native of the Himalayas and China. Plants from the Himalayas grow about 3 feet high, and form dense bushes 3 to 4 feet through, with oblong leaves a couple of inches or so long. From China, however, a much freer growing form has been introduced. This is of less dense habit, with larger foliage, and grows considerably taller. In general appearance it agrees closely with the variety latifolia, which is occasionally met with in gardens. A peculiarity of B. Wallichiana is that the leaves of some plants have a glaucous undersurface, whilst on other plants the leaves are quite green. A pretty little dwarf variety, suitable for rockwork, is known under the name of pallida.

W. Dallimore.

(To be continued.)

FRUIT HOUSES.

The British gardener has added considerably to his laurels since the horticultural engineer and builder of fruit houses adopted the carefully-planned suggestions he was able to make after years of practical study. The combined forces may be said to have produced perfect conditions for the successful culture of all those kinds of fruit that English gardeners are past masters in the art of producing. There is an individuality about the successful fruit grower that commands respect; he must work hard, think clearly, and act wisely, then his trees, being living subjects, will respond to that thoughtful and persevering care which he so willingly bestows upon them.

Of all the branches of horticultural science none call for greater continual effort than that required for the production of regular supplies of fine fruit. Soil, insects, fungoid diseases, pruning, watering, cropping, and ventilating are all matters of the utmost importance, and to be successful all these, and other minor details, must have thoughtful care. In some cases express methods of culture are taken up, and when such is the case the life of fruit-bearing trees may be a short but prolific one. Fruit houses are at certain seasons useful shelters for other occupants. Their style or shape may be span-roofed, lean-to, or three-quarter span, and curvilinear.

Orchard house cultivation has increased wonderfully in late years, and nothing could be more suitable for the reception of trees in pots than a light, strong, well-built and ventilated span-roofed house. The kinds of fruits grown mainly in pots are pears, cherries, peaches, nectarines, choice apples, plums, and sometimes apricots and figs. There are many points in favour of these cultures, more especially where a succession of good fruit is needed rather than a large quantity at any one time, only it must be remembered that the culture of fruit in this manner is a keen test of a grower's skill, and only those who are ever-watchful will produce juicy and fleshy specimens from pot trees. A large house in three divisions is of more practical use than one without any partitions, because of the different treatment required by the trees at varying stages of growth. Sometimes bush trees are profitably planted in borders along the sides of span houses, the centre bed being occupied with peaches and nectarines grown in pots. I have in mind many such structures that have annually produced fine fruits for very many years. Such cool houses are very useful for chrysanthemums after the peaches and nectarines have finished their fruiting, had their annual repotting, and are enjoying open-air treatment until such time as it is thought necessary to restart them for another season's crops.

Span-roofed houses should be at least five feet high from the ground to the eaves, for fruit trees, with a minimum width of eighteen feet. No wiring is necessary for pot-grown trees. Ample ventilation should always be provided for orchard house fruits, and if large trees are grown the doors must be large, to allow for their removal without damage. Spandrils for attaching to the main rafters at the ridge, and brackots for securing the eaves and front uprights, will do away with the need for interior uprights for houses of the width named. If larger and wider houses are required light, strong principals and upright supports will be wisely employed to strengthen the roof.

Lean-to or three-quarter span houses are very suitable for vines, peaches, nectarines, figs, and other fruits. Perhaps it is the favourite form of house in most private establishments, as it lends itself to various methods of planting and training, and, not being so exposed, is not so much affected by strong winds. The width of roof to be obtained where a good back wall exists is also important where a large training roof-space is sought after. Peaches and nectarines, fan trained, must have a suitable trellis fixed eighteen inches or so from the glass, and if the back wall is to be utilised for trees the front trellis must curve downwards, and not go beyond the pathway, so that sufficient light and sun may reach the wall trees.

Before building fruit houses, the position and subsoil will have been examined, and especially so if borders are to be formed for the trees. In all cases it is very necessary to be quite certain that the borders do not act as cesspools for the surrounding ground, otherwise fungoid diseases and an unhealthy growth result. Many gardens have three houses arranged for a succession of fruits, and these are frequently supplemented with wall cases to extend the season. Plenty of ventilation must be provided for both at front and at the top. Lever workings to open ventilators the length of each house are best fixed near the door and pathway; they should be made to work easily, and open the ventilators as widely as possible. In smaller gardens, where it is only convenient to have one house, and a succession of fruit is desired, more varieties may be grown by wiring from the back wall to iron standards fixed about three feet six inches from the front of the house. Five feet apart is a good distance for trees trained across in this manner. The pathway may, in such cases, be close to the front lights and wall. Firm soil, not too rich, and thin training of the branches are necessary with these cultures.

I have seen vines growing in all manner of structures, and have sometimes wondered at the results. Vineries are very important to the majority of English gardens, for grapes are needed over as long a season as possible, and this can only be accomplished when good watertight and airy sructures have been erected, and satisfactorily heated so that all dampness may be expelled. Houses of a rather lofty build are the best for keeping fruit in, and as such structures allow of the vines being trained two feet to two feet six inches from the glass, the foliage is frequently very healthy, and provides shade for a long time after the fruits are fully ripe. The worst enemies to long keeping are red spider, thrips, mealy bug, and closing the houses with a rising temperature so that condensation of moisture settles upon the ripe berries. Early vineries are usually lean-to, and the angle may be more acute for the earliest crops, and also in districts further north, where more rain falls. For keeping fruit a long time the span-roofed house is possibly the best, as it allows for more air during very moist, warm weather.

If vine borders are preferred both inside the house and outside also, arches of brick must be formed along the front to allow the roots free access. Several firms of repute have specially manufactured standards for carrying the fronts of fruit houses when borders are to be formed in the way named. The main rafters of vineries must be strong and well braced, so that the straining of the wires and the weight of the crop may not affect the roof in any way. Span houses, with the pathway down the centre, will be heated on either side, close to the border, or within six inches or so of it; two rows of four-inch piping on each side will heat very narrow houses, but those from eighteen feet to twenty-four feet wide will require from six to eight rows, two rows on either side of the house, and two on each side of the centre pathway. Lean-to houses are certainly warmer than span structures, and should they be required for early crops three rows of four-inch pipes should be arranged near the front, with two rows on the border side of the pathway, and parallel with it. The path in lean-to or three-quarter span is usually about three feet wide, and eighteen inches from the back wall.

When very early grapes are desired pot culture is still practised, with varying success, and the type of house used for early melons or other forcing crops can be made convenient for growing them. In such structures the pots are easily plunged in fermenting material, which keeps the soil in a more uniform state, and such houses have the additional bottom warmth from the hot-water pipes below the bed, which should prevent sudden changes of temperature. In nearly every garden vineries have both brick and glass fronts; the latter is not necessary if cost is a great consideration. Wood ventilators, built into the brickwork, are much cheaper, and it is only on account of appearance that glass fronts score in gardens. Gun metal hinges for lights and latches for doors are superior to steel or iron, and oak sills are necessary for doorways, to stand hard wear. All soft water should be saved, and if each house is to collect its own, good cement and brick tanks may be excavated, and built under the pathways in the case of vineries and peach houses.

In the rarer cases of entirely new gardens, or the demolition of old mixed systems, ranges are built to combine glass houses for growing and showing plants and fruits to perfection, and also suitable potting sheds, soil sheds, mushroom houses, and boiler accommodation. A good high wall, running from east to west, would, in all such cases, be of great value, as, in addition to the boilers and sheds being erected on its north side, it is useful to cut off the frame ground and preparing quarters from the more important site of the garden proper. Very frequently a good span range may run from either end, north to south, thus forming two wings, or if a centre span is added the letter E will be represented on the ground plan. When no wall exists, or is desired, span houses may be usefully connected up by a corridor running east to west; the bays between the houses running north to south form very useful shelters, or areas for frame accommodation.

What may be termed general-utility types of structures for fruit growing are extensively employed by the trade and market growers, and although shorn of all embellishments, either outwardly or in the interior, they are nevertheless congenial to the general health of the occupants, having few harbours for pests, and fewer surfaces to keep moist. They are paying concerns when properly managed, and as such serve their purpose.

Charles Foster.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth, 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

BY SPECIAL APPOINTMENT

BOULTON MAKERS

& PAUL, LTD. NORWICH

MODERN GLASSHOUSES

Designed and Built by us, comprising the Latest Improvements in Construction, Ventilation, Heating, etc., will give continued satisfaction and profit.

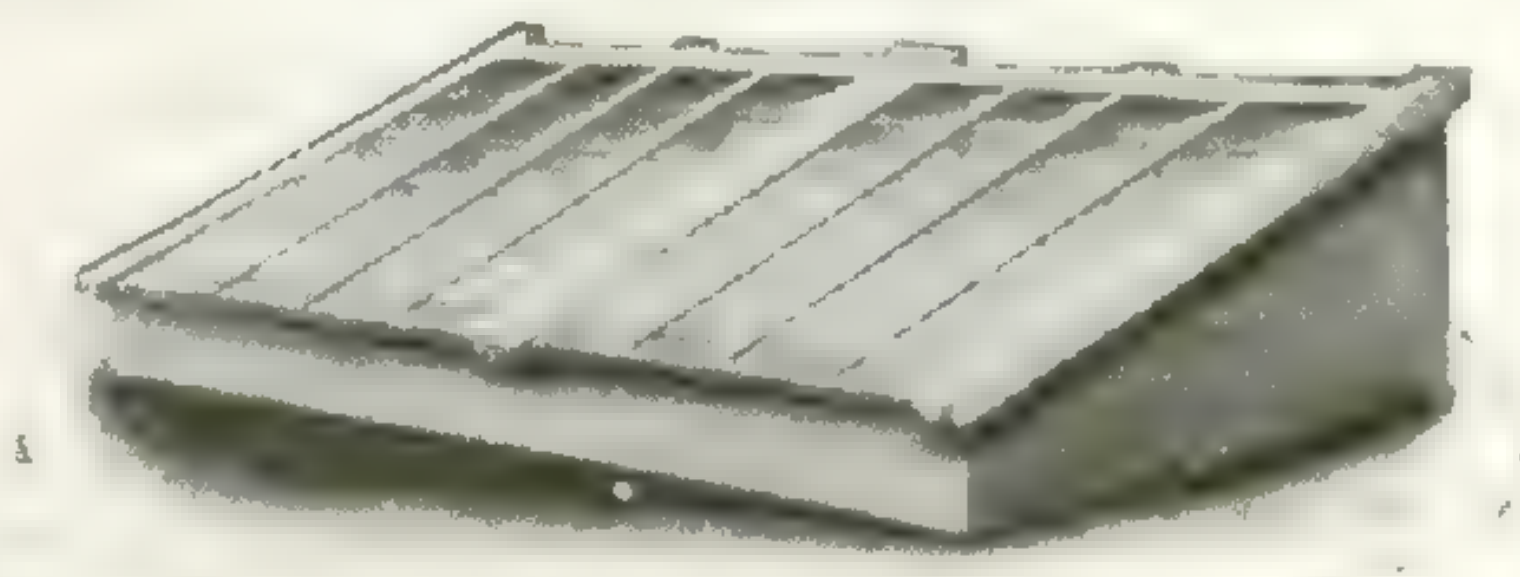
Enquiries invited for

WINTER GARDENS, CONSERVATORIES, VINERIES, PEACH HOUSES, MELON HOUSES, GLAZED PORCHES.

Representatives sent to take particulars in any part of the Country.

HEATING APPARATUS installed in Country Houses, Churches, and Horticultural Buildings in the most economical manner.

GARDEN FRAMES in great variety, always in stock.



Send for latest Illustrated Catalogues, free on Application.

ARCHITECTS DESIGNS CAREFULLY CARRIED OUT.

Bulbs: NARCISSUS, DAFFODILS, TULIPS, &c.

All Good Flowering Bulbs; Worth Double.

GARDEN FRAGRANCE.

There are some questions in the general planning of gardens which are pressing for a satisfactory answer, and the question of garden fragrance is one of these. Too often we plant only for colour effects, for harmonious blendings, for expressive contrasts, forgetting that one of the greatest assets in the making of a successful garden is the proper appreciation of fragrant flowers and plants.

Bacon, in his essay on gardens, gives a high place to fragrance. Consider this: "And because the breath of flowers is far sweeter in the air, where it comes and goes, like the warbling of music, therefore nothing is more fit for that delight than to know what be the flowers and plants that do best perfume the air." Expressive, and fully deserving of appreciation from all who have the care of gardens, or the love of gardens, in the heart.

In the short list which the philosopher gives of plants that bestow their fragrance upon every breath of the breeze that blows, we note the violet, the musk rose, sweet briars, wallflowers, pinks, and carnations (or the clove gilliflowers, as the old rendering has it), the blossoms of the lime tree, and honeysuckles. At such a choice no one can cavil, and while we in English gardens can make full use of the old-time favourites, we have the additional advantage of possessing a far wider choice of fragrant subjects than Bacon and his contemporary garden lovers ever dreamed of.

Bacon mentions (rather wistfully, perhaps) the perfume of bean flowers, regretting that "they are flowers of the field," and whoever knows the pleasure of a country life knows the delight afforded by acres of bean blossom in early summer. With them one associates the aroma of new-mown hay, and the August fragrance of the clover fields, and surely Nature affords no higher pleasure than these fragrant delights.

Ofttimes the desire for a manifest display of colour rings the death knell to fragrant plants. The vivid geraniums are gorgeous, but give no fragrance to the air. Begonias are the same. Dahlias, pentstemons, asters, nemesias, and other glowing groups of plants are sadly deficient in the needful quality, and where these are largely used I would advise some highly fragrant subjects be associated with them. If we could persuade the majority of gardeners to bestow as much care upon the scented annuals as they do upon many scentless ones, the summer garden would be more replete with fragrant zephyrs, a place to live and revel in.

Stocks should be always largely grown, a series of beds giving a wonderful odour and a charming display. The sweet alyssum in its best forms should be used by the hundred and thousand, Nicotiana affinis, and the night-scented stocks should in every garden of any pretensions. Tulips and narcissi should be chosen for fragrance, as well as for beauty of form. Certain forms of the pansies, irises, lilies, and azaleas are far more fragrant than of their brethren. Seek them out, and give them a position of honour. The lemon-scented verbena, daphnes, myrtles, lilacs, and jasmines give additional wealth, and as for the deutzias, philadelphus, the range of charmingly scented roses, honeysuckles, and the old-world southernwoods, rosemary, balms, allspice, and winter heliotrope, words fail to express their value in the garden of sweet odours. Even the modest mignonette would of itself exhaust the energies of the best prose writers in an effort to fully describe its charms.

I have not attempted to give a descriptive list of sweet-scented plants, my purpose being solely to emphasise the importance of the subject, and in this I shall doubtless be aided by all lovers of the garden. That there is a danger of losing a great measure of the "old-time fragrance of the garden," must be fully apparent to all. In the race for novelties, for flowers of more majestic proportions, or of ideal form, there is the risk of gaining one point and losing a more important one. Already we have too many scentless roses; several highly-admired carnations lack this needful attribute. Certain strains of pansies are practically devoid of fragrance, and even many of the larger varieties of Viola odorata (the sweet violet) are greatly deficient of the violet's greatest charm. It is for the garden lover to assist in rectifying these faults of the commercial grower. Of the novelties among the fragrant flowers choose only those which retain the delicious fragrance of the old-world forms. In shrub planting, secure a sufficiency of those forms which will scent the air, and plant them freely for the good of the garden.

A bower of honeysuckle and jasmine, an avenue of mock orange or scented thorns, a rose garden where roses are grown for perfume, or a pathway in the wild garden where one can tread the scented thymes, mints, etc., underfoot, and rejoice in the aromatic sweetness, are but a few of the phases of delight one finds in the search for garden fragrance.

P. S. Hayward.

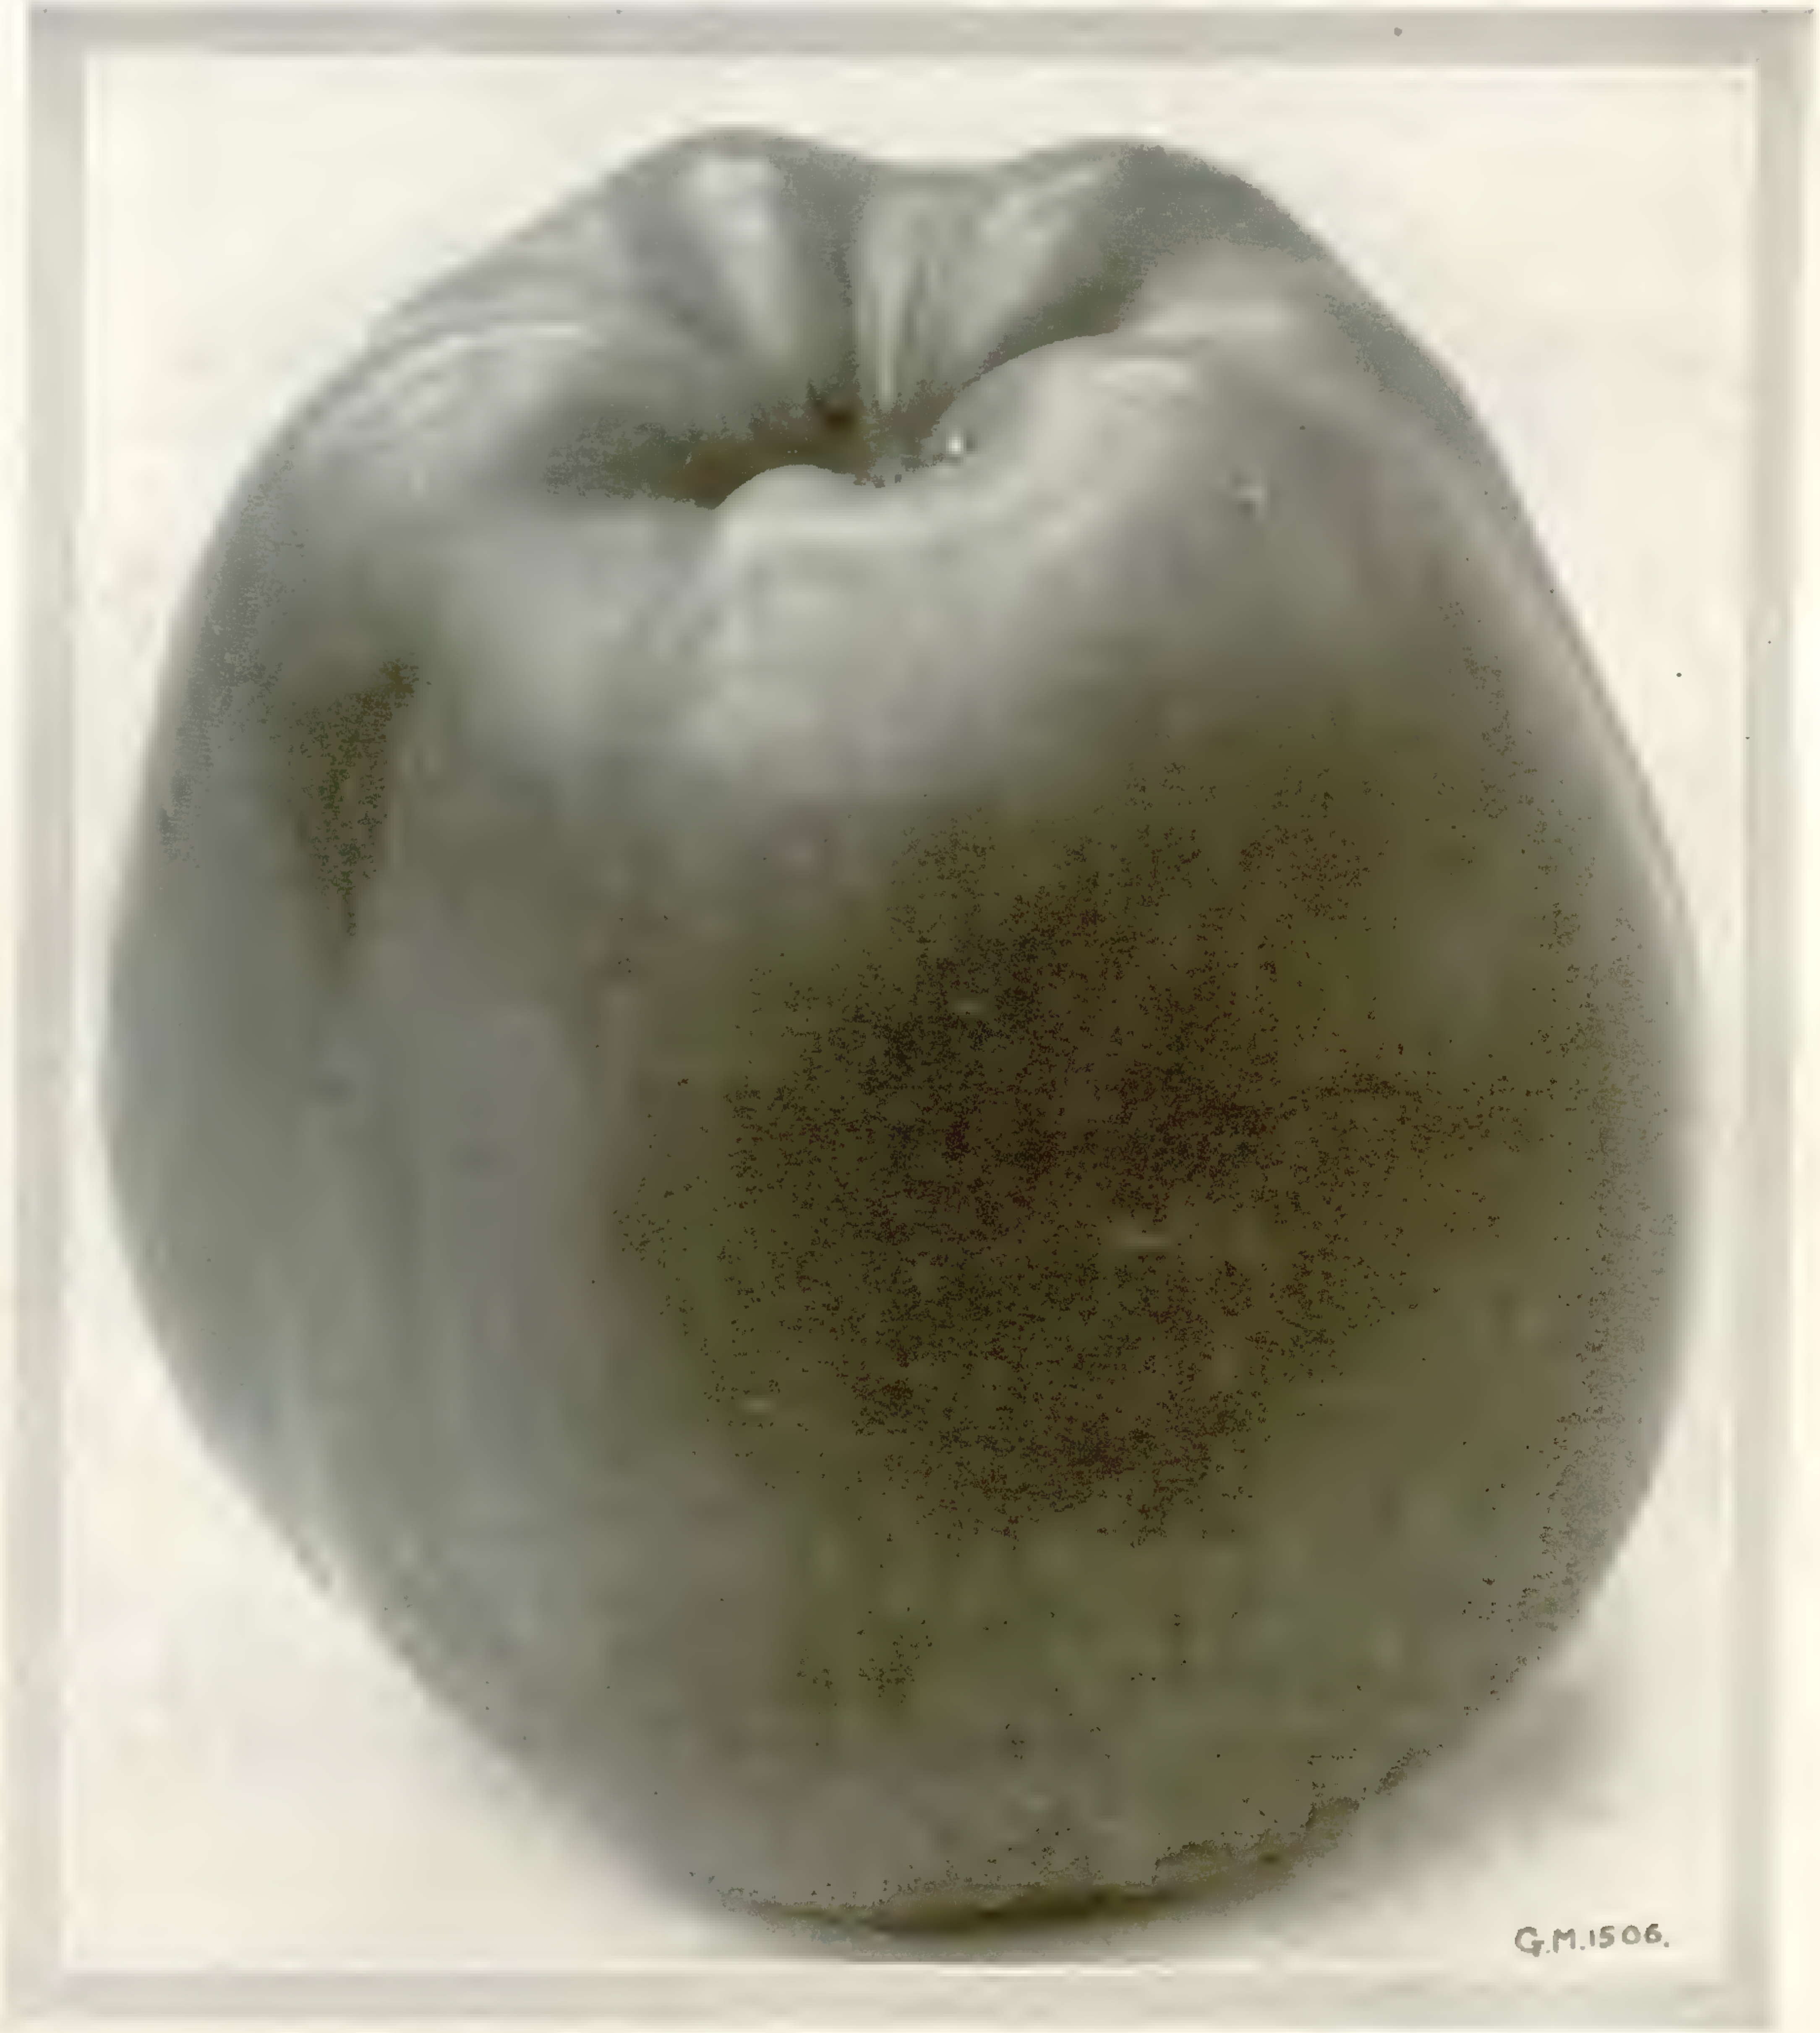
A GOOD COOKING APPLE.

◆

Lord Derby.

This apple is known also as London Major, a name, however, seldom used. I do not know anything of its origin, but it has been in existence at least forty years, probably more. In appearance it much resembles Gloria Mundi, which is at least a century old. Lord Derby is a first-class kitchen apple in use up to Christmas, and one that should be more grown, as it succeeds generally where most other sorts do, crops freely, and grows to quite a large size. It is, perhaps, not so attractive as some because of its prominent ribs or crowns, which stand out toward the eye, and detract somewhat from its appearance. The colour, too, a dense dark grass green, is not attractive, and that means much in a kitchen apple with those who are not conversant with the individual quality or peculiarities of certain varieties, either in colour, growth, cropping, or quality. In a market apple a fine outward appearance has much to do with its success. Where Lord Derby is known there is no trouble at all with its sale, and it should be much better known than it is. When kept its green skin changes to a golden hue, displaying then its few russet dots, with an occasional line of the same colour, but as a rule it is quite yellow when kept. The tree is of hardy growth, and, owing to its upright habit, is best suited for bush culture.

E. Molyneux.



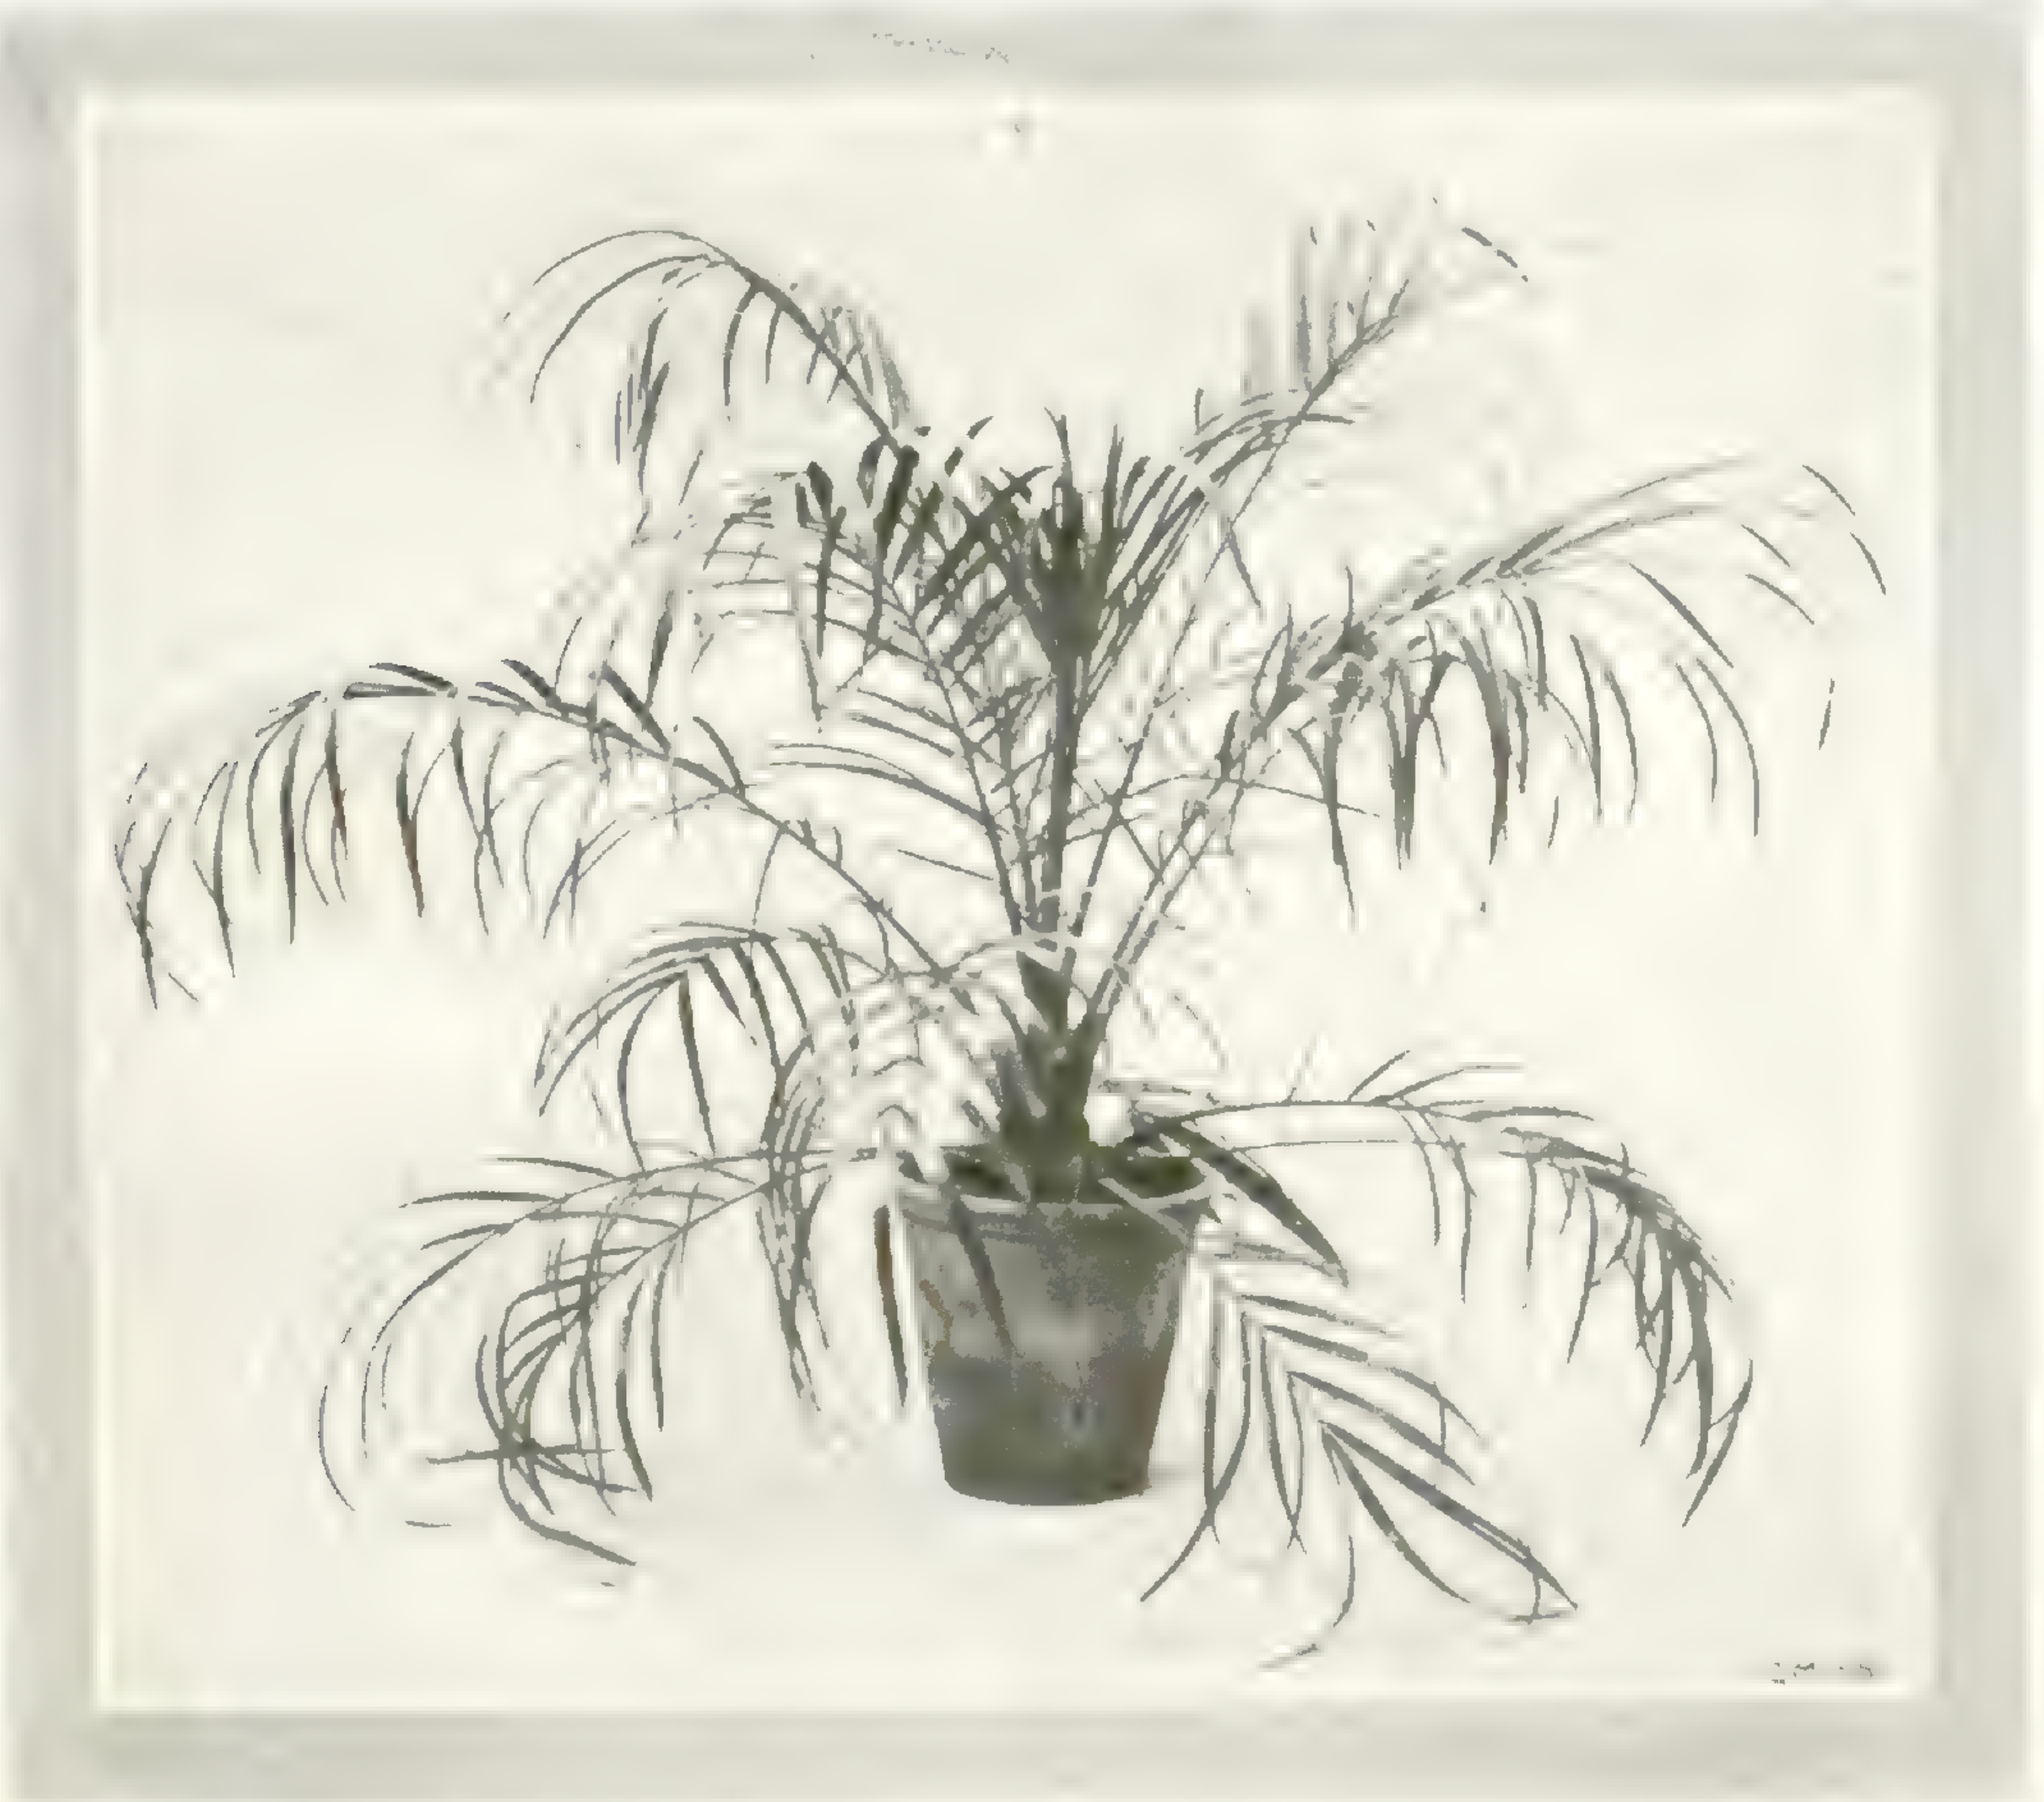
COOKING APPLE LORD DERBY.

HARDY PLANT CHAT.

◆

Campanula latiloba.

This old bellflower does not appear to be so largely cultivated as a number of years ago, or, at least, the proportion of gardens in which it is to be found is smaller than at one time. In all likelihood the improvements effected in the fine C. persicifolia have tended to throw C. latiloba, still known as C. grandis, into comparative neglect. But I always think that it is a really fine plant when well treated, and that the indifference with which it is frequently viewed is due to the fact that the most has not been made of it. When properly cultivated this campanula is a truly handsome flower, the white variety especially being an excellent ornament of the border of hardy flowers. It is a stately plant, this bellflower, and is very fine indeed, when grown as it should be, and sending up stems three or four feet high clothed with large open saucer-shaped flowers of a fine blue or a wax-like white—wax-like in texture and glossiness, but purer in colour, and arranged, a little stiffly perhaps, along the stem.



PHŒNIX ROEBELINI.

The secret of true success with C. latiloba is to divide it annually, or, at least, every two years, as, if left alone, it will make mats of small leaves, and will only send up a very few spikes for the size of the plants. If divided and replanted in rich, well-manured soil, the plant will be certain to please the admirer of the stateliest campanulas—flowers which ever appeal to the gardener by their presence and their beauty.

The Cupidone.

Occasionally one sees what may be called a "fuss" made about the Cupidone, as Catananche cærulea is called by many, but it is as well for those who care for hardy flowers to know how far this is justified. So far as the value of the cut flowers are concerned, this is a plant which may be cultivated, inasmuch as the blue flowers of the type, and the blue and white ones of the variety called bicolor, are extremely useful, though small, while the fact that they last long when cut adds to their value. But I never think the cupidone of much appearance in the garden, as the long, thin stems are out of proportion to the size of the blooms they carry. Then I haven't found the plants so hardy as one would like, and have occasionally lost them in very hard winters when cultivating them in a cold garden.

Tyermann's Marsh Marigold.

I often think, as I see the golden flowers of the single and double marsh marigolds, of the lines of Tennyson, where he says: "The wild marsh marigold shines like fire in swamps and hollows gray," and reflect that we do not sufficiently admire the single-flowered forms in our gardens, but are inclined to lavish our affection upon the double varieties. These are very fine, and last longer in perfection than the singles do, but they have a lumpiness inseparable from blooms such as these are, while the single ones have more elegance of form. The singles are, however, too common in many parts of the country to be sought after as garden flowers, but there is, I consider, room in the garden for one or two of the finer form or with larger flowers than those of the ordinary Caltha palustris.

This desideratum is now obtainable in the form of Caltha palustris Tyermanni, which is offered by the trade, and is, so far as I know, the finest single variety in cultivation. It is a handsome plant in every way. The flowers are large, and of a splendid golden-yellow, and their fine form renders them especially acceptable to many. The plant itself is partly prostrate, and the flowers are freely borne.

Of course, the fact that the marsh marigold is a lover of the water, and does best with its "feet" in that element, makes it less effective in the dryish border, but in one which is not too dry it will give flowers of fair size, and the plant will grow fairly well. Tried, however, in a foot or so of water, it will astonish those who see it when they find how effective this variety of an old favourite wild flower will become.

Papaver orientale Jenny Mawson.

Those of us who frequent the Temple Shows and other exhibitions where hardy flowers are largely shown can well recollect the changes which have come over the Oriental poppy within recent years. We can remember the advent of such a flower, for example, as Blush Queen, now almost relegated to the rubbish heap, and how we found what seemed the acme of perfection in the way of scarlets in the grand P. bracteatum, not yet easily superseded by the many fine scarlets we now have. But it is in the softer shades that the change is more noticeable, and we must all have followed with increasing delight the fresh introductions of several raisers.

Defects have been eliminated and colours made brighter and clearer, and thus the whole standing of the gorgeous and exquisite Oriental poppy has been elevated. In Jenny Mawson we have one of the most beautiful of all. It gives us truly lovely flowers of a beautiful salmon-rose, well supported on stout stems, and yet possessing all the delicacy of texture and the apparent fragility we always associate with the poppy. I have grown it for a few years—before it found its way into trade circles, in fact—and I annually admire its lovely flowers, and congratulate myself upon the possession of this exquisite poppy.

S. Arnott.

PHŒNIX ROEBELINI.

Many of the date palms are very suitable for conservatory decoration and other purposes, but very few are sufficiently elegant in a small state to be used on the table. One species, however, is useful in this respect, and has an elegance that places it in the front rank of decorative palms. This is Phœnix Roëbelini. For many years this palm was very scarce in cultivation, but latterly it has been raised from seeds in fair numbers, so that now it can take its place with Cocos Weddelliana and Geonoma gracilis for table decoration. That it will not suffer by comparison a glance at the accompanying illustration will show: this represents a plant recently exhibited by Messrs. W. Cutbush and Son, Highgate, one of very many beautiful specimens in 40-sized pots.

Phœnix Roëbelini is a native of Siam, and was introduced into this country by M. Roëbelini, of Manilla, and it was first submitted to public notice at Messrs. Protheroe and Morris's sale rooms in the autumn of 1889. The next time it made its appearance in public was at a meeting of the Royal Horticultural Society, held on March 11, 1890, when it was exhibited by Messrs. B. S. Williams and Son and by Messrs. Sander and Co., and was awarded a First Class Certificate. It is a slow-growing and dwarf species, and needs stove culture.

Digging and Trenching.—On all light land this work should be pushed forward with all possible speed. Ground of a retentive nature can be treated likewise should dry and frosty weather set in. When trenching, place the green and long manure in the bottom of the trench, and the decayed manure under the top spit; leaves and grassy material can with advantage be used in the bottom trench also. When digging or trenching at this season always leave the surface in as rough a state as possible. To gain this end we should never shovel out when trenching, but rather take an extra "draw," or "spit," with the spade or fork to reach the arranged depth, whether bastard trenching or double digging. The whole of the soil will remain much more porous treated so.—G. E.

NEW PLANTS, ETC.

VANDA CÆRULEA BLUEBEARD.

A very beautiful and large-flowered variety of this increasingly popular vanda. The flowers are shapely as well as large, and the colour is clear rich blue, with some paler markings between the veins, while the lip is intense violet-blue. A.M., R.H.S., December 6. Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

CYPRIPEDIUM WATERLOO.

A large and very bold cypripedium, derived from C. Mrs. Mostyn and C. Ranjitsinjhi. The big white dorsal sepal has a large bright purple base, and the petals and lip are yellowish-green, shaded with rich brown. A.M., R.H.S., December 6. Mr. E. V. Low, Vale Bridge, Haywards Heath.

ODONTOGLOSSUM CERES PLUMPTON HALL VAR.

This is a delightful hybrid between C. Rossi and C. Rolfæ, and is the finest form of this hybrid yet seen. The flowers are of fair size, and have white sepals and petals, barred over the basal half with red-purple. The broad and conspicuous lip is rose-pink. A.M., R.H.S., December 6. W. R. Lee, Esq., Plumpton Hall, Heywood, Lancs.

ODONTOGLOSSUM ROUGE DRAGON.

A handsome odontoglossum, obtained from O. Phœbe and O. ardentissimum. The spike shown was a large one, and carried shapely flowers, pale rose, with whitish tips, and very heavy crimson blotches. A.M., R.H.S., December 6. W. R. Lee, Esq., Plumpton Hall, Heywood.

CHRYSANTHEMUMS.

December Gold.—A splendid Japanese market variety of excellent size, graceful form, and refinement. The blooms and petals are firm, and travel well. The colour is very deep gold, some flowers being lightly flushed with orange, thus intensifying the shade. F.C.C., N.C.S., December 5. Mr. Norman Davis, Framfield.

Lady Furness.—A charming single variety, with rounded flowers of fair size. The colour is bronzy-buff with a salmon flush and a paler zone round the centre. F.C.C., N.C.S., December 5; A.M., R.H.S., December 6. Messrs. W. Wells and Co., Merstham.

Mrs. Gilbert Drabble.—This is a very fine ivory-white exhibition Japanese variety. The blooms have depth, grace, breadth, and solidity. The florets droop somewhat, and curl up prettily at the tips. F.C.C., N.C.S., December 5; A.M., R.H.S., December 6. Messrs. W. Wells and Co, Merstham.

Cissie Rungay.—A very pretty single variety. Commendation, N.C.S., December 5. Mr. Thomas Stevenson, Woburn Place Gardens, Addlestone.

Jack.—A bright single variety of great decorative value; the flowers are chestnut-crimson and gold. Commendation, N.C.S., December 5. Mr. Thomas Stevenson, Woburn Place Gardens, Addlestone.

Phœbe.—A decorative variety of rich pink colour; probably a good market sort. Commendation, N.C.S., December 5. Mr. H. W. Thorp. Worthing.

BEGONIA GLOIRE DE LORRAINE ROCHFORD'S VAR.

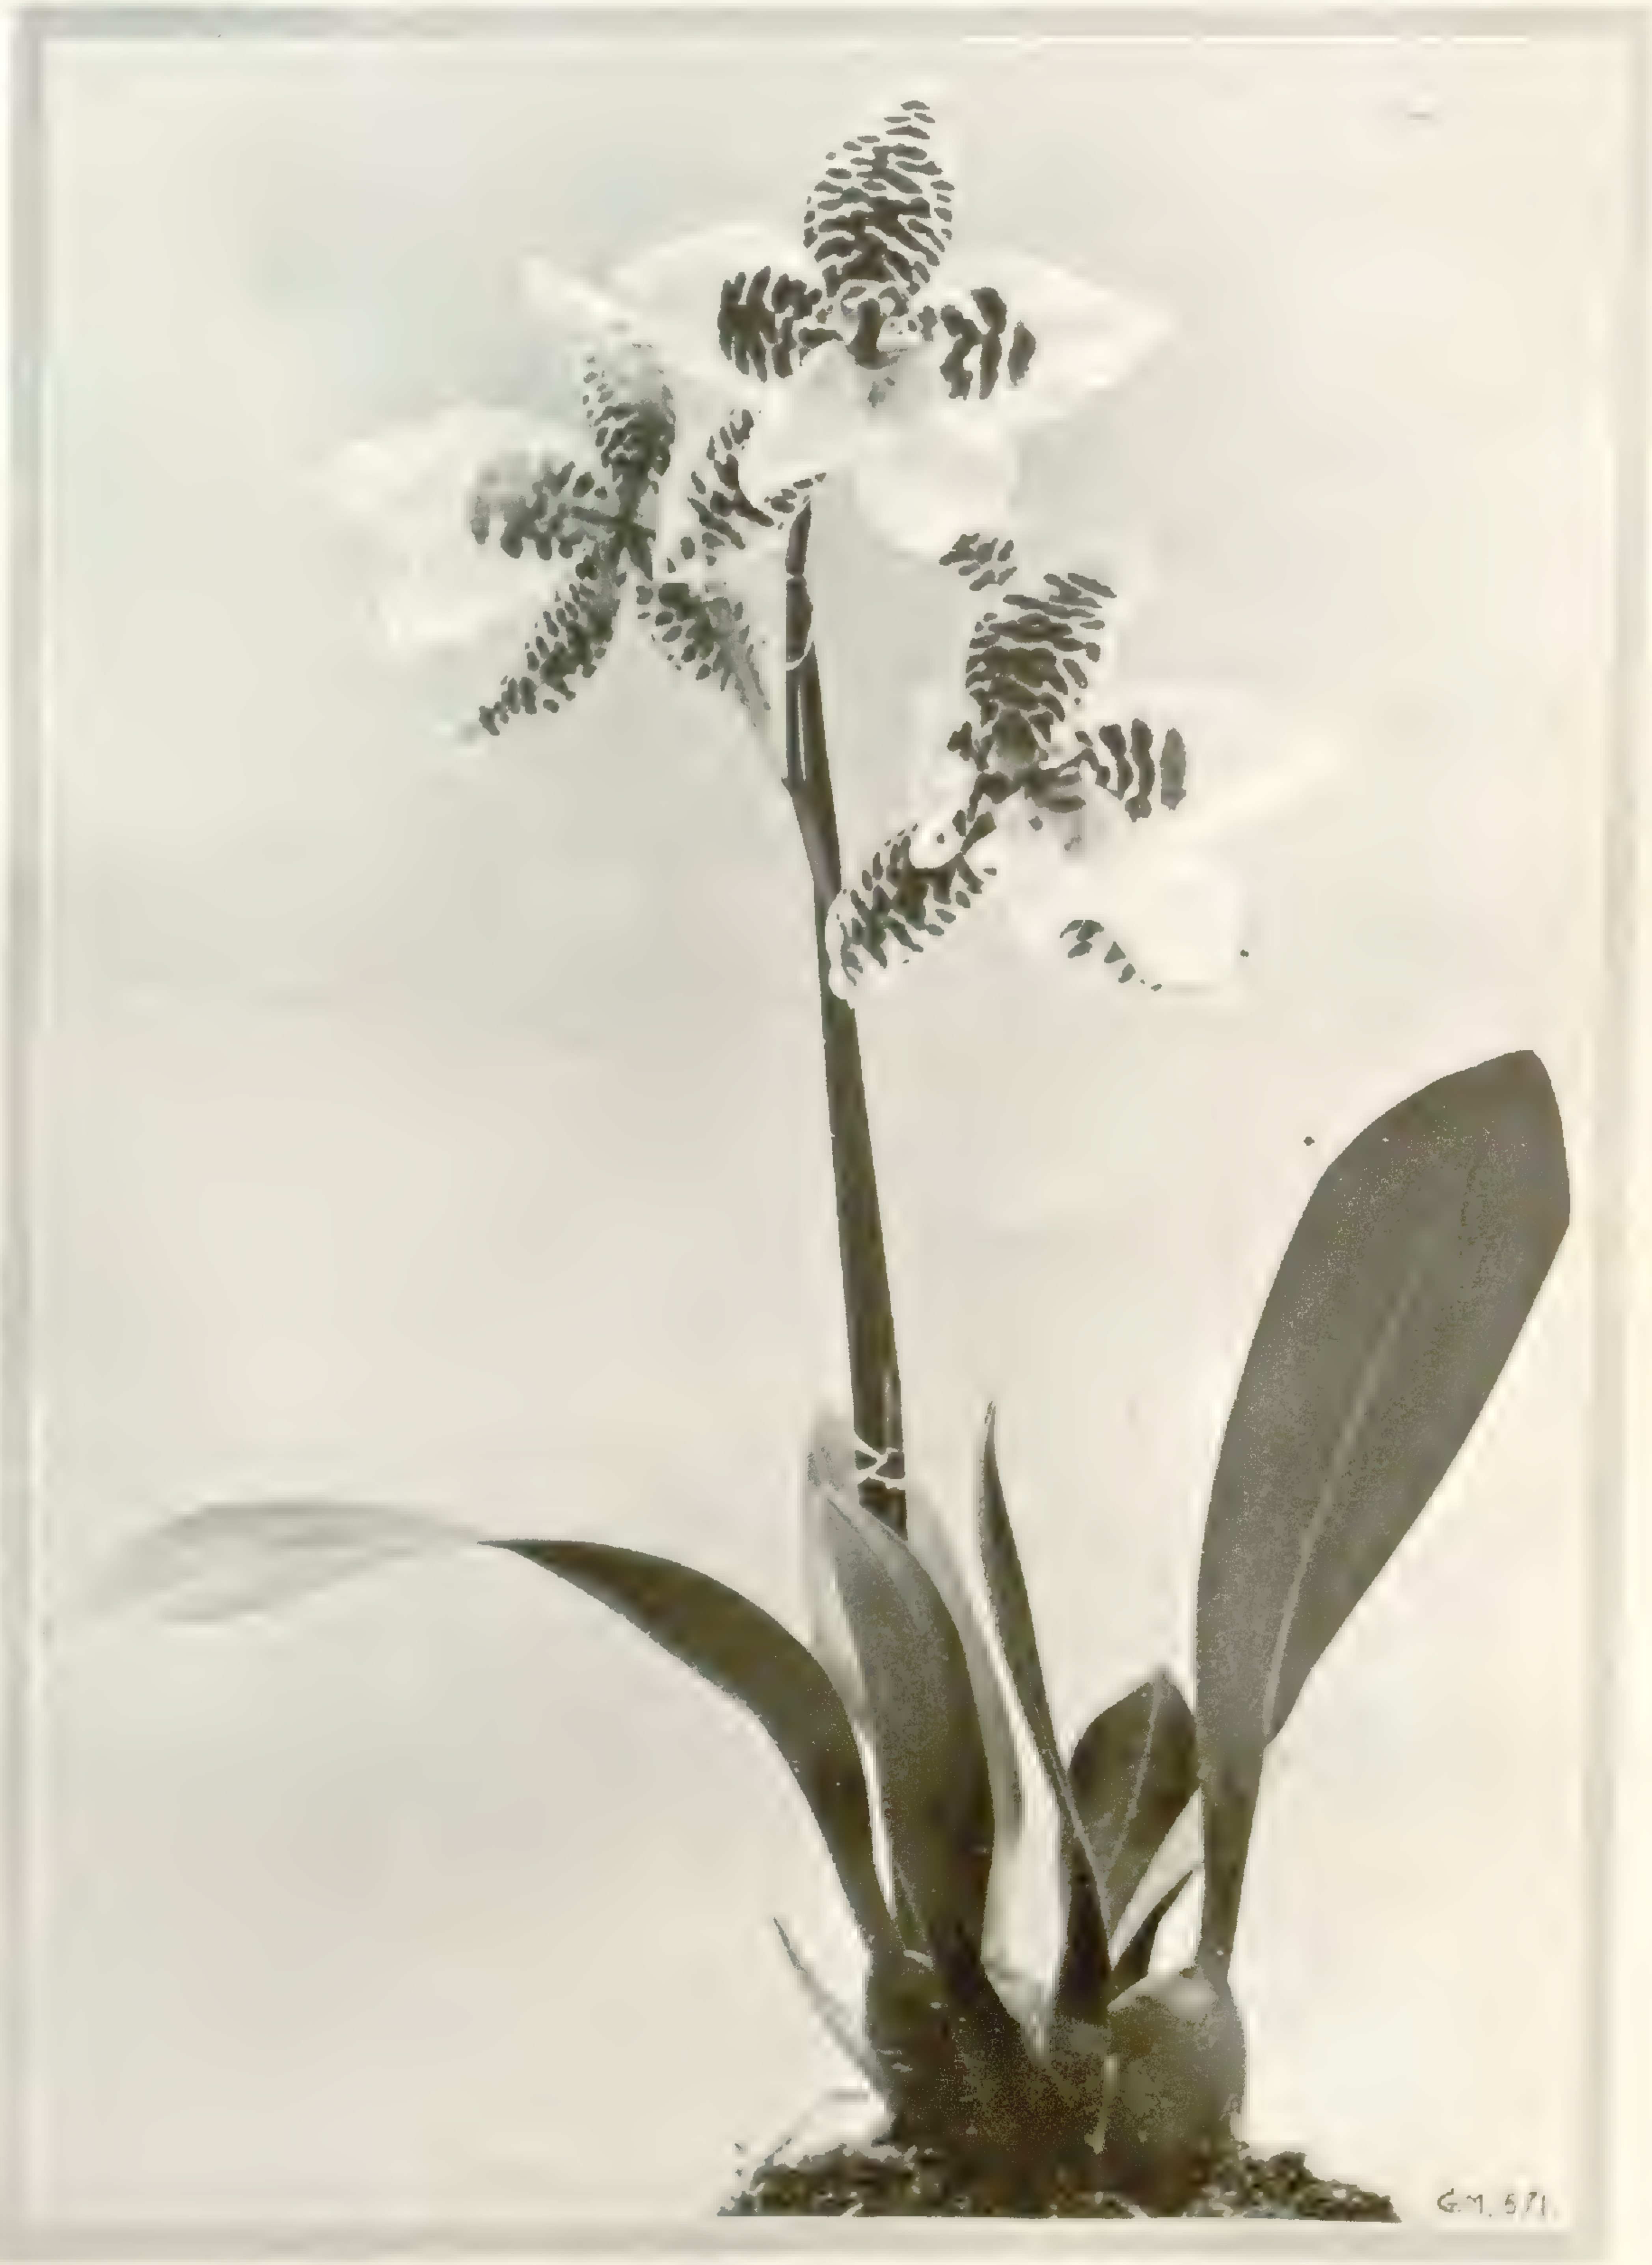
In this variety the colour of the flowers is far richer and deeper than in any other of the sports yet placed before the public. There is a red or crimson flush over the deep rose ground colour, and doubtless under artificial light the shade would be particularly effective. A.M., R.H.S., December 6. Messrs. Thomas Rochford and Sons, Broxbourne.

HONESTY.

This hardy, old-world plant (Lunaria biennis) is still worth growing, though some object to the magenta colouring of its so-called crimson and purple varieties. The white form, however, is so weed-like and characterless in appearance, in my opinion—though many take the opposite view—that I never grow any but the brighter varieties, taking care not to let them flower where their colour will clash with that of anything near it, as it will do with flowers of a red or purple colour, such as wallflowers, aubrietia, red tulips, and the like. It has the great merit of growing practically anywhere, alike in sun or shade, in the driest as in the wettest places, though in the last-named it sometimes comes through a severe winter badly. It reaches its greatest perfection on light chalky soils. As it will produce some effect where few other things will thrive we need not give up good situations to it.

It is a true biennial, no sowing, however early, producing flowers the same season, while the finest flowering plants of all are produced by those which fail to flower the year after they are sown. It is only worth a place in the flower garden proper when well grown, and a little care should be used to obtain large plants by sowing the seed early in the spring, and thinning out the seedlings. It should be sown every spring, as it cannot always be trusted to sow itself, at least where one wants it, possibly because of its large seeds, and it is a typical crucifer in its dislike of being transplanted. It need not be pulled up when flowering is over, as it does not become untidy, and the seed pods look rather handsome during the summer, besides being useful for winter decoration when mixed with winter cherries, gladwyns, and other kinds of berries. It is essentially a plant for the wild garden, in shady situations amongst trees and shrubs, and on dry banks.

Alger Petts.

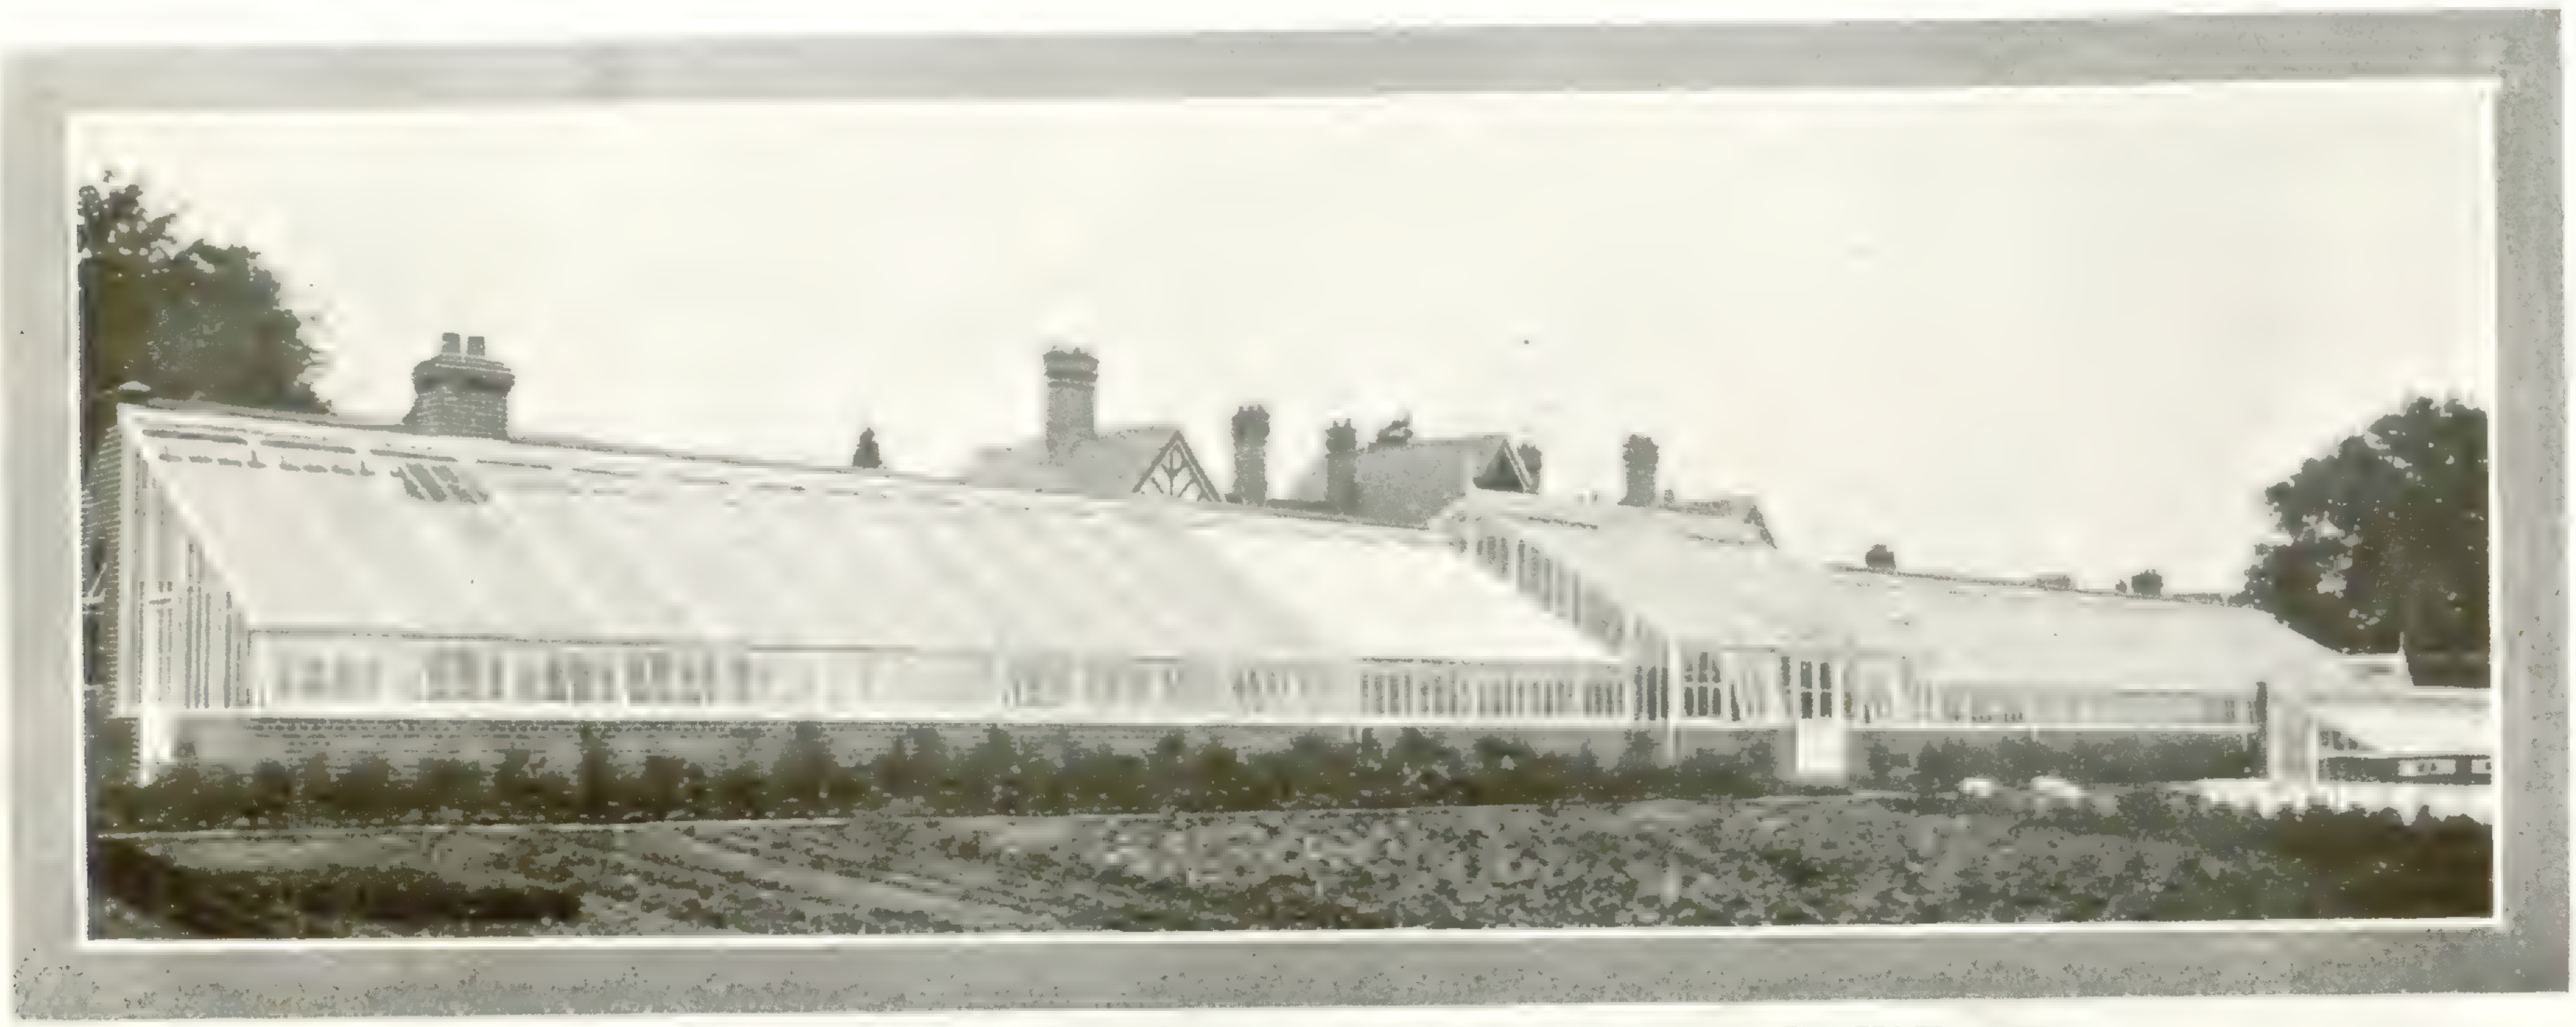


ODONTOGLOSSUM CERES PLUMPTON HALL VAR.
Flowers white, with red-purple markings and rose-pink lip. A.M., R.H.S., December 6. W. R. Lee, Esq., Plumpton Hall, Heywood, Lancs.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

DESIGN IN FRUIT HOUSES.

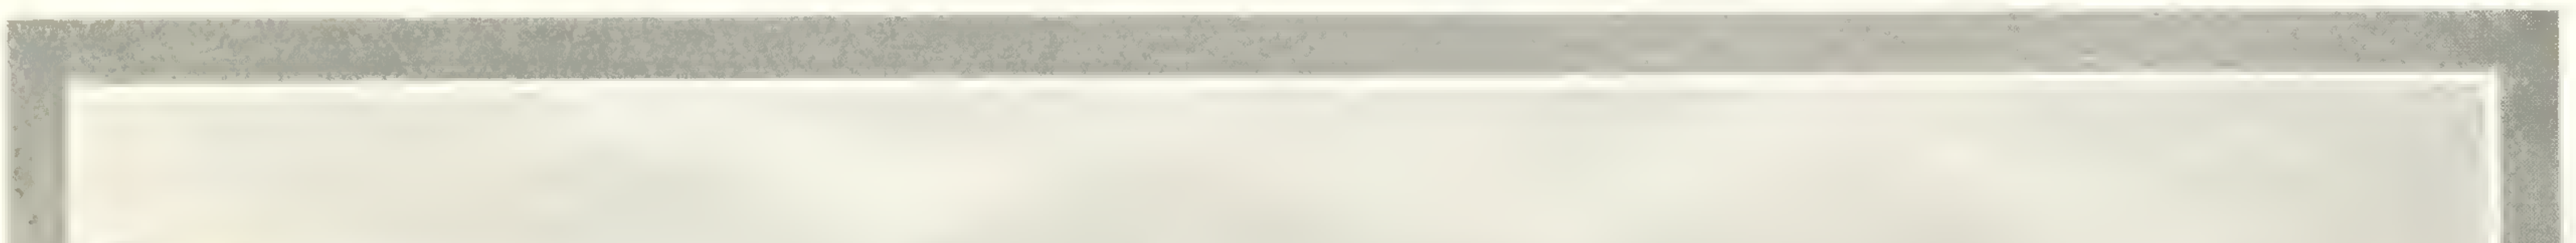
For the purpose of adding to the utility, which is great, of the article on fruit houses, that Mr. Charles Foster has contributed to the present issue, we have thought it desirable to illustrate a few structures that have been built in different parts of the country within a comparatively recent period. The houses have been erected by some of the leading firms of horticultural builders, whose work is well known for elegance of design and the excellence of materials and workmanship, and accordingly represent fruit houses of the highest class.



A RANGE OF FRUIT HOUSES WITH PLANT HOUSE.
Erected by Messrs. Messenger and Co.

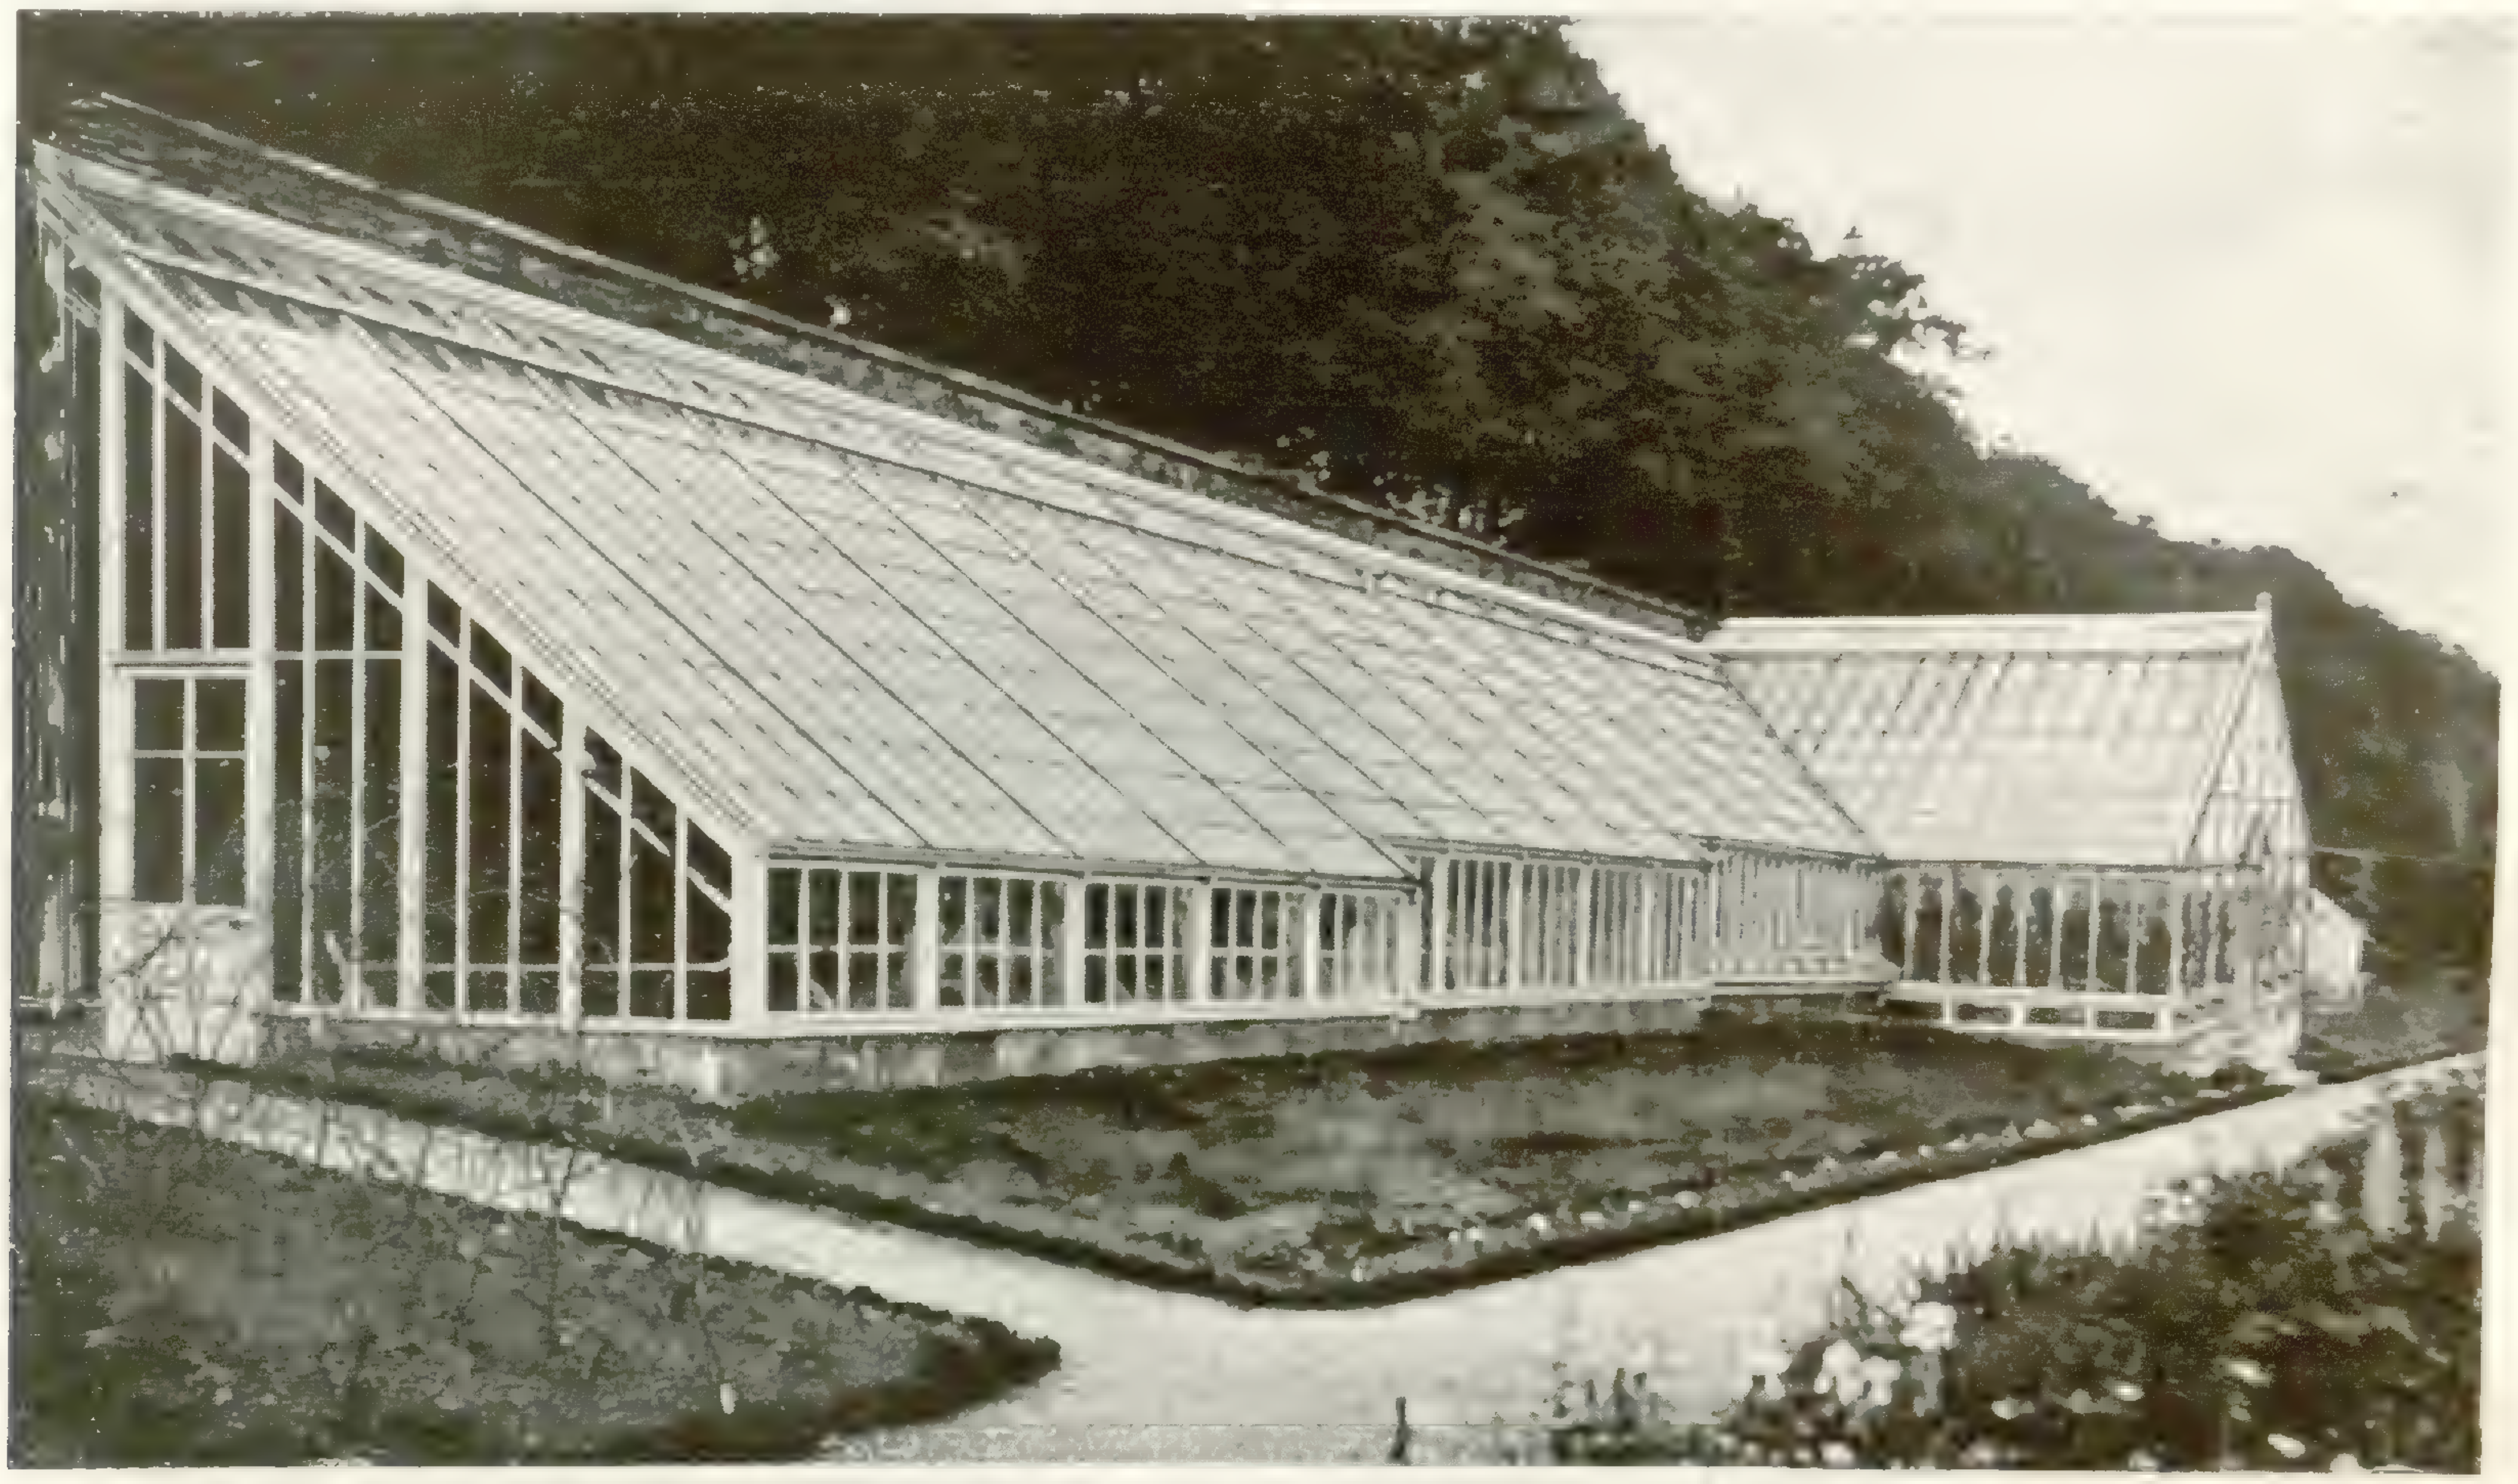
In visiting gardens in different parts of the United Kingdom many examples of the excellent work of Messrs. Messenger and Co., of Loughborough, have come under our notice, and while in no way wishing to suggest that the range herewith illustrated is the best of these, we would direct special attention to it as one that has much to recommend it. Here we have lean-to vineries, peach houses, and other structures devoted to fruit culture adjoining each other, an arrangement that readily admits of those in charge passing from one to the other without loss of time, a point of no small importance early in the spring when there is a rapid change in the weather conditions, and the growth is so tender as to be highly susceptible to injury from outbursts of sunshine, or a lowering of the temperature outside, and the ventilation has to be regulated with the greatest degree of nicety. Moreover, this arrangement permits of the houses being entered without the admission of cold currents of air, and of the whole of the structures being heated from a single boiler if so desired. The range, it will be seen, is broken up by a half-span house which can be utilised in the cultivation of flowering and ornamental-leaved plants, or be devoted to the various classes of fruit. For example, grapes, peaches, nectarines, or figs may be planted in borders, and have their growths trained to trellises, as in the case of span-roof houses occupying similar positions, or they may be utilised for pot trees. On several occasions, when visiting gardens in which the glass structures have been erected by this well-known firm, we have found the span-roof houses forming part of ranges devoted to the growth of fruit trees in pots, and these have not only been distinct and interesting features, but the trees have contributed their full share to the fruit supplies. We need hardly say that the system of ventilation is of the best, both as regards the regulation of the admission of air in accordance with the requirements of the occupants of the houses, and the rapidity with which the ventilators can be opened and shut, a point of much importance early in the year.

If there had been an occasion to institute comparisons between the relative merits of the various kinds of fruit houses that have a place in gardens, it would unquestionably be necessary to assign the most prominent position to those devoted

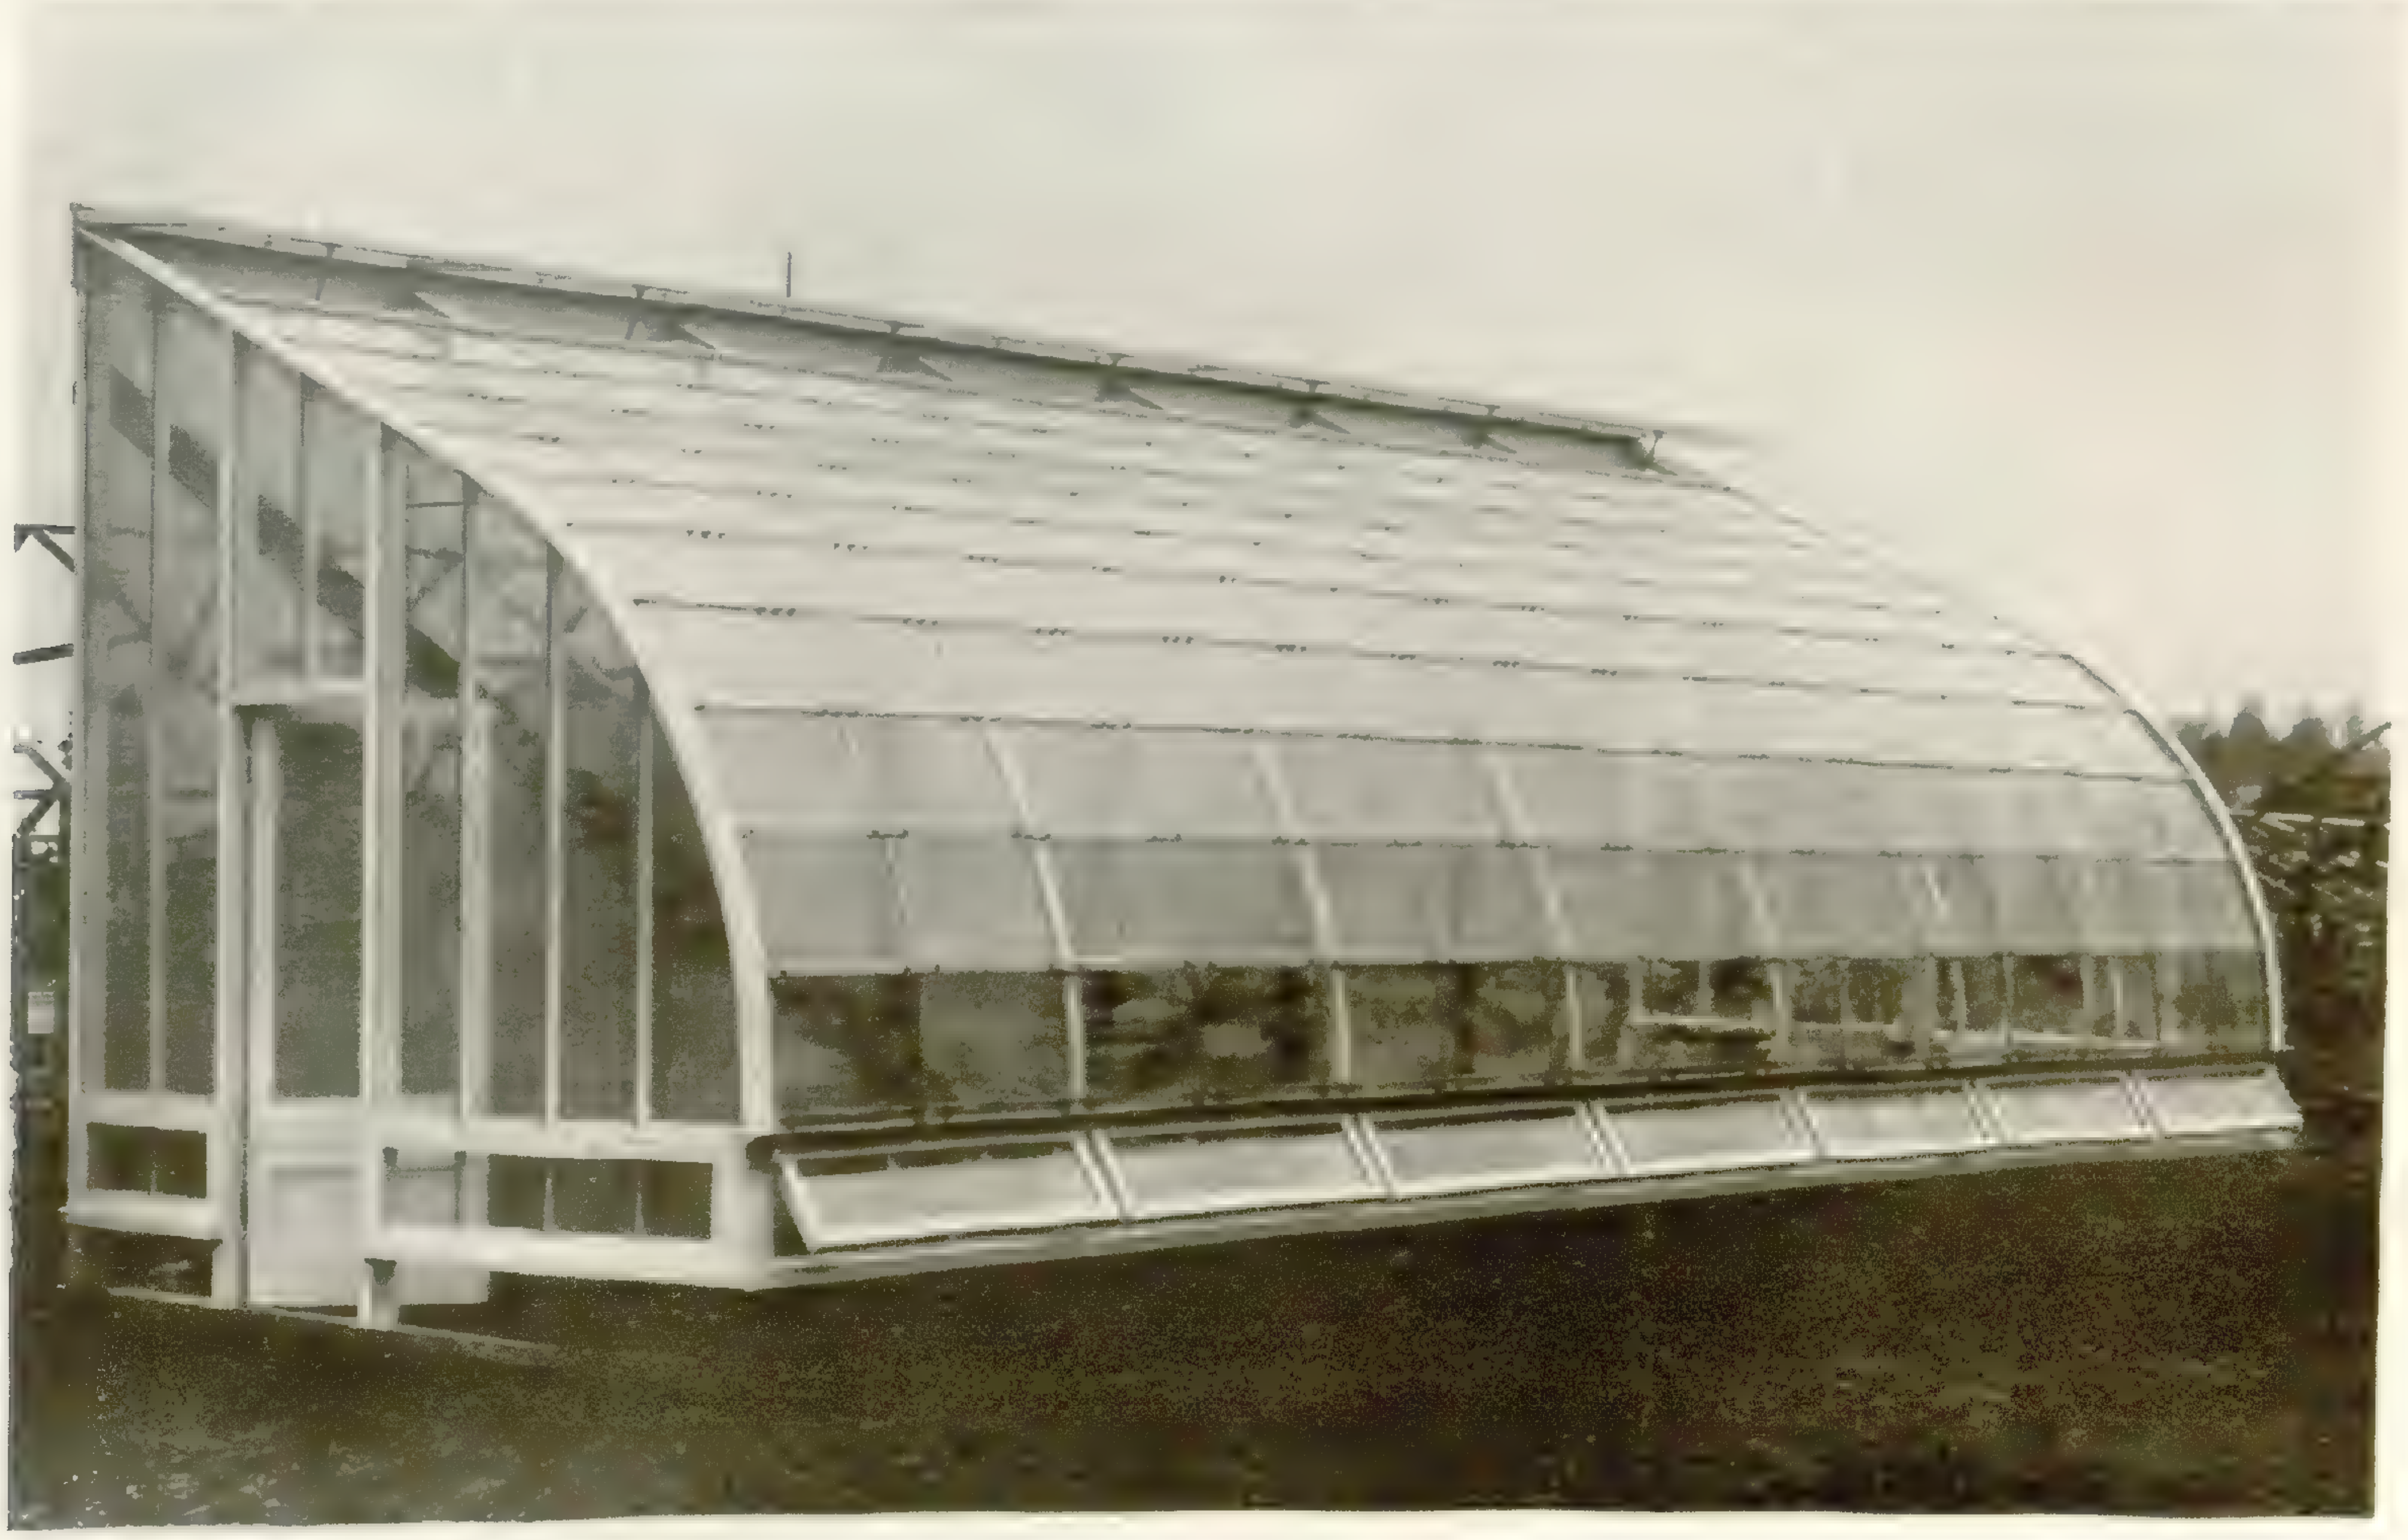


A RANGE OF VINERIES.
Erected by Messrs. A. Richardson and Co. in the Gardens of Syon House, Isleworth.

to the production of the supplies of grapes. Peach houses would probably rank next in importance, and, having regard to their rapid increase, it may be that in a few years hence they will, in point of numbers, more closely approximate the vineries than is now the case. For the present, the latter enjoy the pre-eminence both as regards numbers and utility. This is in a large measure explained by the fact that grapes may be had in the best possible condition over a longer period than any of the other fruits grown under glass, and in some degree by the greater popularity of the fruit. Having regard to the facts thus briefly stated, it is evident that vineries are essential to the proper furnishing of gardens in which fruit culture under glass is conducted, and that their selection, furnishing, and management form by no means the least important of the duties of the general body of gardeners. This being the case, the illustration given herewith of the remarkably fine range of vineries recently erected by Messrs. Richardson and Co., of Darlington, in the gardens of Syon House, the seat of the Duke of Northumberland, can hardly fail to prove useful. At one time iron houses predominated in these gardens, and in calling these to mind, it is impossible to avoid being impressed with the advances that have been made in the construction of glass-houses of late years. The illustration shows that the vineries in the Syon House gardens are elegant in design and spacious, and we would add that the arrangements for heating and ventilation are as nearly perfect as one can hope to see them. We have seen in other gardens vineries built by this firm, and, if some have differed in design they have all been equally elegant and adapted to the production of grapes of the highest quality. Many structures for the production of other kinds of fruit have come under our notice which have been so admirable in design and construction as to well deserve special mention. Space, however, will not



A RANGE OF LEAN-TO FRUIT HOUSES WITH SPAN-ROOF PLANT HOUSE IN CENTRE.
Erected by Messrs. Mackenzie and Moncur at Dalmeny Park, Linlithgowshire.



A CURVILINEAR ORCHARD HOUSE.
Erected by Messrs. Saunders and Biss.

admit of our doing more than refer to the numerous fruit and other houses that have been built by Messrs. Richardson and Co. in the Royal Horticultural Society's Wisley Gardens, which are especially deserving of attention.

The range of fruit houses erected by Messrs. Mackenzie and Moncur, of Edinburgh, in the gardens of Dalmeny Park, Linlithgowshire, the seat of Earl of Rosebery, and herewith illustrated, affords an excellent example of a style of arrangement that should be adopted when, as in this case, a considerable number of houses can be built to adjoin each other. It will be seen from a glance at the illustration that the structures, while substantial, are sufficiently light in construction to allow the grapes, peaches, and other fruits to receive the maximum amount of light throughout the various stages of development of growth and fruit. The range consists of six lean-tos and one span roof, the latter being deserving of attention for its value in breaking up the uniformity characteristic of a long range of houses of exactly the same height and thereby improving the general effect. The span-roof division is found especially useful in most gardens for the cultivation of palms and other tall-growing plants remarkable for the beauty of their foliage or elegance of appearance required for indoor decoration, but it could, of course, be used as a vinery or fig or peach house if so desired. This is a fine example of the fruit houses built by this well-known firm, and in directing attention to them as especially suitable for gardens generally, we must not lose sight of the fact that they represent but one of the many different forms of houses built by the firm.

The system of zinc bar dry glazing introduced by Messrs. Saunders and Biss, of Exeter, upwards of a quarter of a century ago, has proved so admirably adapted to fruit houses of all kinds, as indeed to other classes of horticultural structures, that it continues to steadily increase in favour among owners of gardens and among also those engaged in the management of gardens. It is claimed for this system of glazing that, as the zinc sash bars cause but little obstruction to the passage of light, the fruit trees are placed under the most favourable conditions for perfecting their growth and bringing their crops to maturity, and that in like manner ornamental plants are able to attain their highest state of development. Also, that, as no putty or paint on the outside of the roof is used, the cost of maintenance is materially reduced. Briefly stated, the roofs glazed in accordance with this system consist of rafters of a strength carefully adjusted to the length of the roof, and these support strips of deal, which are fixed at a distance apart that is regulated by the length of the squares of glass used in covering the roof. These latter are held in position by the zinc sash bars, which are fixed at the ends to the cross-pieces. When the sash bars are in position the glass is slid into the grooves or clips, and made secure by means of two simple yet ingeniously devised clips, one of these, as shown in the accompanying illustration, being placed at each of the lower corners. The system of zinc bar dry glazing does not place any restriction upon the taste or judgment of the designer, as exemplified by the various forms of structure that have come under our notice when visiting gardens. Span roof, half-span, and lean-to structures for the various kinds of fruit that are usually grown under glass are erected by the firm, and, judging by the results, answer their purpose admirably. We have selected for illustration an orchard house, with a curvilinear roof, which not only shows the manner in which the houses are glazed, but it represents a form of house that has much to recommend it as an aid to the production of abundant supplies from pot trees of peaches, nectarines, plums, pears, and other fruits usually grown in the orchard house. With an unbroken area of glass from the apex to practically the ground level the trees enjoy uninterrupted light, and the arrangement of the ventilators is such as to admit of a free circulation of air being maintained.

PROBLEMS UNDER CANVAS.

Inconsistency seems to be the outstanding feature of Mr. E. Molyneux's recent criticism of my recent article under the above title, for in one part thereof he observes that judges should carry out the published stipulations to the letter, and in another he allows a secretary to accept entries at the last minute in face of published stipulations that these should be sent in at a certain time.

Your correspondent seems to have a poor opinion of his fellow-gardeners, for he says, "Too often the professional in committee-men shows too plainly that position in the prize list is nothing to him outside the monetary value of the prizes." Perhaps there is some reader of the Gardeners' Magazine, a professional gardener, an exhibitor, and member of a show committee, who can say a word in answer to the above strong charge. For the special information of Mr. Molyneux, who appears to have a marked capacity for jumping at conclusions, I would say that my experience as a judge at what he calls ordinary shows, both single-handed and with others, is not so limited as he thinks, and I suggested the point cards for collections as the result of that experience. I am quite aware that in a good many cases it is not necessary to point collections in order to arrive at a correct decision in the awards, but there are numerous instances where such a course is necessary, and, irrespective of absolute necessity, I recommend it all the same, not for the purpose of appeasing disappointed exhibitors, but in order to indicate to them where their weak points lie. This information, I contend, is nothing more than an exhibitor's due. Mr. Molyneux talks about wasting valuable time, but it would not take as long to jot down points on cards provided for the purpose as it would to hang around after the awards are made for the purpose of explaining matters that exhibitors do not understand, and it very often happens that when an exhibitor is looking for the judge in order to have that two-minutes' conversation with him, which your correspondent suggests, the judge has gone home, or is engaged elsewhere.

I do not know what Mr. Molyneux means by saying that "too often awards are made on a basis that requires much more explanation than such judges can give." Surely if a man cannot explain the reason why he gives a certain decision he is not competent to judge, and is like the umpire in the village cricket match who when pressed to explain a decision observed, "I'm umpire, and when I say out, why out he goes."

In reference to the debatable point brought forward in the article which started this discussion, does Mr. Molyneux contend that flowers of every shade of colour which one gets from a packet of seed, of such an annual as Phlox Drummondi, for instance, are distinct varieties? H.

Hardy Clethras.—For a cool, moist spot such as azaleas and rhododendrons delight in, the Clethras are well suited. One great recommendation is the fact that their sweet scented blossoms are borne at the end of the summer and early autumn. They belong to the same order as the azaleas and rhododendrons, but are in general appearance widely removed therefrom. They all form open bushes, usually from 3 to 5 feet in height, clothed with rough leaves, thin in texture.—W. T.

DEEP CULTIVATION.

The leader on page 951 on the above subject is opportune, and so covers the whole range of practical knowledge and methods of carrying it into effect that there seems little to add to what is already so well said. In vegetable culture especially is the value of deep cultivation apparent. When we see the plot of ground on which the giant onions are grown gradually rising above the surface level until the soil is quite a yard higher than the surroundings, there is no disguising the fact that deep cultivation is important, because in the first place there is this yard of added material in addition to the yard below that has been trenched previously. It is common practice now to grow the onions on the same plot for many years. In the same way can potatoes be grown quite successfully on the same site for thirty years at least. Although it has become a recognised practice to plant and sow various crops in rotation there is not the necessity for this changing of crops annually that many would have us believe. The point that must not be forgotten is to return those constituents to the soil that the previous crop has carried away, because plants do not live upon the soil itself, but upon what it contains.

Of course, the manner in which deep cultivation—trenching—is carried out, so much depends upon the kind of soil a person has to manage. I am a staunch believer in trenching heavy soils, but I do not agree with the few who advocate bringing the subsoil to the surface. No advocate of the latter method has yet given a practical common-sense reason for so treating soil; they tell us to do so, and leave the pupils to work out their own salvation. I know there are some who advise and carry out the teaching, but how do they carry it out. Why, they cover the surface so thick with compost (of the kind described in the leader) for the first season that plant life does not need to exist upon the subsoil from the bottom of the trench, because the surface dressing is so ample, and when this is dug over after the crop is taken, the late subsoil is converted into a good medium for plants, and as time for the second crop comes round the same surface-dressing is practised. This method is quite of a practical character, but who beyond the rich can practise such a method?

This is not sound teaching for those who are handicapped. Far better keep the subsoil at the bottom adding to it light material as often as possible. Trenching is not practised because it provides an additional source of plant food, but because it not only warms the soil by the admission of air, but provides a quick means of drainage, which is a boon in some soils where the hard pan of subsoil prevents percolation of surplus water, thus setting up a basis for canker in fruit trees, disease in larch timber, and general stagnation in all growth. The non-practical person will hardly believe how the trenching of soil affects the growth and quality of larch trees; nine-tenths of the canker among the trees is mainly due to a subsoil that is not congenial to growth. Strange as it may seem to some, gardeners especially, the trenching of soil is distinctly injurious to the wheat crop. This plant must have a firm basis for growth; a loose soil beyond 9 inches deep induces a too gross growth, which results in abortive ears, owing to the production of too much straw; maturity in the wheat plant is a necessity, and gross growth prevents this. So farming practice sometimes differs from that of the horticulturist. E. Molyneux.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

WINTER-FLOWERING PLANTS.—It frequently happens that the greatest demand for plants in flower in private gardens is during the months of December, January, and February. Forced bulbs cannot be used for all purposes, but many of the commoner kinds of orchids are available for this season. I have already pointed out the advantages of the winter-flowering cypripediums, which carry us over the period above-mentioned. We have also the deciduous calanthes, and such familiar forms as C. vestita and C. Veitchi, are grown extensively for this purpose, even where there is no pretence to cultivate orchids. There are two others that may be added to the above-mentioned kinds, for they are in every way worthy of consideration; these are Calanthe William Murray and C. Bryan. It is generally found that these give more satisfaction than can be obtained from C. vestita.

CŒLOGYNE CRISTATA, where grown in pans or small pots, is useful for decorative purposes, and the larger specimens furnish a supply of cut flowers during January or February. The plants of the different varieties of this species should now be placed in an intermediate temperature, or even warmer conditions should the flowers be required earlier, and the necessary encouragement afforded to assist them to develop, and expand their flowers. In the neighbourhood of London and other large towns, where fogs and impure atmospheric surroundings have to be contended with, C. cristata is not an easy subject to deal with. There is nothing more detrimentally affected by fogs. The flower scape, should it be in a forward state, turns black, and becomes filled with moisture, which generally destroys the flowers. We used to find it desirable in the London area to keep the cœlogynes as cool as possible until the middle of February, so that by retarding them the blossoms escaped the disastrous effects of fog.

DECIDUOUS DENDROBIUMS. — The great advantage of growing a number of plants of the different kinds of dendrobiums is that one is able to maintain a succession of flowers from January to late in the spring. Many of the plants that finished their growth early in the autumn are at present showing their flower buds, and they need but little encouragement to induce them to develop rapidly. The danger with the early-flowering plants is a too liberal treatment, therefore care must be observed not to give too much heat or excess of root moisture until the flower buds are to be distinctly seen. Extreme liberal treatment before this period turns the flower buds into growths, so that young plants are produced instead of flowers. If the most forward kinds are selected at regular intervals there is little difficulty found in keeping up a succession of flowering plants.

LYCASTES, such as L. Skinneri, L. Deppei, L. aromatica, L. plana, L. gigantea, etc., will have their flower buds in different stages of development, and by careful treatment they may be induced to give flowers over a lengthy period, as the flowers are exceedingly durable. The white Masdevallia tovarensis is a charming plant for edging groups, and is exceedingly useful for cut flower purposes.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

CALADIUMS.—For the convenience of removal for house washing, etc., and for ease in storing, it may be advisable to shake the caladium corms out of the soil, and store them carefully in dry sand, and, if the boxes or pans are placed where there is no danger of moisture, there will be no fear of rotting during the rest of the winter months. This system of storing is particularly adaptable for the small growing varieties, such as C. argyrites, C. minus erubescens, etc., etc., but neither must be removed from the warm house.

ACHIMENES.—These are quite dormant by now, and may be accorded the same treatment as caladiums, storing the small corms in shallow pans or saucers. Gloxinias may also be served in the same way, though here again boxes may be used, and the two latter subjects may with advantage be removed to a warm dry shed. This will save a great deal of time shifting them about when the time comes for washing the houses, and where they are left under stages, etc., they are very apt to get a good wetting, with the result that they commence growing again long before they are required.

FLOWERS. — When poinsettias are cut down they may be removed to a cooler house, thereby making room for any batches of lily of the valley, hyacinths, spiræa, etc., that may need forwarding for Christmas and the New Year; at this season house parties, etc., prove a great drain on the resources of the plant houses, so that every effort should be made to keep up an adequate supply.

ADIANTUMS.—Where these are grown in the stove during the greater part of the year it is advisable to give them a rest, and the present is about the best time to do this, so that all those that are not actually throwing up young fronds may with advantage be removed from the stove to a drier and cooler house. This hardening will not be in any way detrimental to the fronds that are in good condition on the plants, and these may be cut as required, after which the plants may receive rather less water for a time, and if kept in this state till about the end of January they will be in good condition for potting on or splitting up, and will then grow all the better for this short period of rest.

CROTONS, DRACÆNAS, acalyphas, aralias, panax, etc., that may have been used in the house, and have lost their leaves somewhat, should, if required for stock purposes, be cut down on returning them to the stove. If they are thoroughly cleansed, and kept fairly dry for a time, they will soon begin to push forward young shoots, which will make good cuttings for February striking, though in the case of the aralias they will need to be worked on to stock plants of Aralia Guilfoylei or A. reticulata, either of which strike very easily, and if a few cuttings of these two latter are put in from time to time during the year, a good stock of those beautiful table plants, A. gracillima, A. elegantissima, or A. leptophylla can be kept up by grafting. These last three may be struck from cuttings, but it is a very slow process, and such plants bear no comparison with those that are grafted. — Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

SUCCESSIONAL AND LATE FIGS. — These, and the houses containing them, should be now thoroughly cleansed upon the lines recently directed for early forced trees. If the disbudding and stopping of shoots was in due season skilfully executed, there will be but little pruning to attend to, and in cases where these details of management have been neglected the pruning required will chiefly consist of removing weak and badly-placed shoots, and immature points of those reserved. These failings usually result from the shoots being allowed to become crowded, or from the structures being in unsatisfactory positions, or imperfectly ventilated, whereas shoots kept properly thinned, and their leaves well exposed to air and light, become sturdy, well matured, and fruitful. Trees that have made unsatisfactory strong, pithy growths are unlikely to produce good first crops of fruit, and the evils should be corrected by attention to root-lifting and pruning, fresh compost, and the rectifying of imperfect drainage. During the time the trees are at rest the temperature of the house should be kept cool, merely excluding frost, and the borders be given no more water than is sufficient to preserve the soil in a slightly moist state.

EARLY VINES IN POTS.—As the growths advance gradually disbud the surplus ones leaving the completion of the operation until the best bunches can be discerned; meanwhile remove from each lateral any surplus bunches it may carry, and when the laterals are of sufficient length stop them at two leaves beyond the bunches, the sublaterals at one leaf, and merely keep them from contact with the glass until they are strong enough to be safely secured to their trellis. The vine's reserved sap having at this stage become exhausted, closer attention to watering, with tepid water, will be necessary, with the addition of weak supplies of liquid manure, or light top-dressings of suitable artificial compounds. The night temperature should now be about 60 deg., and that by day 10 deg. higher. On fine days, at closing time, spray the vines overhead with tepid soft water, and maintain a moderately moist atmosphere by damping the floors, etc.

VINE BORDERS. — Grapes of the best quality are produced by vines growing in borders that are in various respects widely dissimilar, therefore a would-be cultivator of the vine need not hesitate to plant, or despair of obtaining good results, even if circumstances do prevent him from fully carrying into practice the advice concerning them usually recommended by good practitioners. If borders have not already been made for vines to be planted next spring, they—preferably inside ones—should be now attended to, in order that they may become consolidated and warm before planting time arrives. It is invariably a good practice to concrete the site, and with a view to prevent an accumulation of water, place upon it a suitably-arranged four-inch tile drain, then place over the whole surface of the concrete one foot of brick or stone rubble, covered with turves with their grass side down. Upon this foundation place from 2½ft. to 3ft. of compost, sufficiently dry to admit of its being made tolerably firm by treading, without its becoming pasty. It is also advisable to make the border in sections of about 4ft. in width, until the space is filled as required. A good compost consists of roughly-broken turfy loam, free from wireworm, and taken in preference from chalky or limestone formations, to which, according to its texture, should be added in a greater or lesser degree finely broken-up old mortar rubble, wood ashes, or carefully charred suitable garden refuse and finely-crushed bones.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

PARSNIPS.—These are always superior in flavour if left in the ground for some time to come, but as the season advances continuous frosts may be expected at any time, and it is then very advisable to take up a quantity for use, and store in a cold place where they will be easy to get at.

JERUSALEM ARTICHOKES can be treated as advised for parsnips on light soils, but where growing in cold, heavy soils they are better dug and placed in small mounds free from slugs and frosts.

TOMATOES.—The strongest of the young seedlings will require potting, and the others can remain in thumb pots until the New Year; do not over pot. Replace them on a shelf near the glass in a temperature of 55 degrees, or thereabouts, and keep them rather dry. Fruiting plants should be subjected to the same treatment, and once a week will be found quite often enough to apply water.

CUCUMBERS that are fruiting must at this season be cropped very lightly, and the fruits cut early to maintain the health and energy in the plant so essential for the next two months, maintain a humid temperature from 60 to 65 degrees.

MINT AND TARRAGON.—Continue to introduce batches into the forcing pit or warm greenhouse. Boxes are serviceable for the reception of the roots. Mustard and cress, endive, dandelion, chicory, and seakale should be introduced in plenty for the approaching festive season, and the New Year.

GENERAL.—Remove all leaves, and all remains of crops to the rubbish heap, and make the paths and spare plots as neat and tidy as is possible until digging, etc., can be accomplished.—George Ellwood, Swanmore Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Chrysanthemum Society.

(Continued from page 984.)

We now come to the last stage of my lecture—that of staging the flowers for exhibition. This is more important than it appears to be on the surface, and prizes have been won and lost in close competition on staging alone. The largest flowers must be placed at the back and the colours should be arranged as artistically as possible. Clashing of hues must be guarded against, and at the same time as much variety as possible must be aimed at. If the back row contains good deep flowers arrange them so that the top of the second-row flowers just covers the bottom of the back-row flowers. The front-row blooms should be well clear of the board, but at the same time must not be staged too high. All the flowers should be evenly arranged, so that if a string were held in a taut position horizontally over the top of the stand, each flower would just touch the string. Staging incurveds and staging Japanese are quite different matters, and considerably more patience and time is needed on the former than on the latter. Where in Japanese careless arrangement often adds to artistic merit, in incurveds it would be fatal. All through the plant's existence neatness is the great aim.

I will now give a list of what I consider to be the best selection of thirty-six incurved varieties at the present time. In this selection I have considered all the points which go towards perfection in exhibition blooms; but, as some growers invariably meet with success in some varieties, while others experience better results in the culture of totally different varieties, I shall not attempt to keep closely to any order of merit. For if three or four flowers are similar in petal, and are about equal in size, it is simply a matter of opinion as to which is the best of the batch:

Clara Wells.
Buttercup.
Ethel Thorp.
Lady Isabel.
Mrs. G. Denyer.
Mrs. Barnard Hankey.
Duchess of Fife.
Emblême Poitevine.
Daisy Southam.
J. Wynne.
Romance.
Frank Hammond.
Topaze Orientale.
C. H. Curtis.
Triomphe de Montbrun.
May Phillips.
Frank Trestian.
W. Pascoe.
Pantia Ralli.
Fanny Lemon.
Miss Nellie Southam.
W. D. Parkins.
W. J. Higgs.
G. F. Evans.
Boccace.
Mrs. J. Wynne.
Souv. de Wm. Clibran
W. Biddle.
Godfrey's Eclipse.
Le Peyron.
Calypso.
H. Hearn.
Amber Beauty.
Egyptian.
J. Agate.
Ialene.

Buttercup will produce splendid flowers if the cuttings are inserted at the end of March. The plants are allowed to grow naturally, and the first bud which appears is taken, only one flower being grown on each plant. In this case the final potting will be delayed, and a six-inch pot is used.

Mrs. Hankey can be grown in a similar manner, except that the young plants are stopped when they are about three inches high, and then the first bud is taken.

While I am speaking on the indivdual treatment of certain plants, I will also add that

Frank Hammond should be stopped the first week in May, or it will be too late for any exhibition.

Egyptian forms its first crown bud rather late, usually about the first or second week in September. Consequently it should be given a higher temperature than the average variety.

One of the great disadvantages which at present attends the culture of the incurved chrysanthemum is that the dates of most of our exhibitions are too early to be consistent with the full development of the majority of our incurved exhibition varieties. The ideal time for a show is a date a day or two before or after November 15. It really seems a great pity to have to pull out the centres of a great many sorts, for under these conditions they cannot possibly be shown to greatest advantage.

Having come to the end of my lecture, I should like to remark that of late years fewer incurveds have been exhibited at our shows. The true cause of this is rather difficult to determine. It may be that they require more care and attention, more skill in staging and dressing than Japanese, or it may be that they are losing favour with the public. We have now reached a period when popular sympathy is with the Jap., and the single is rapidly gaining the admiration of flower-lovers. A great many people prefer decoration to the formal incurved showboard. But in spite of these drawbacks, I feel sure that if incurved chrysanthemums do gradually assume the fourth place, it will be due to lack of interest, not amongst the public, but amongst the growers. Personally, I should like to see many more entries in the incurved classes of our exhibitions. Interest in them would then revive, their culture would advance more rapidly, and raisers would be encouraged to produce more new sorts every season. At the present time the number of new varieties brought out each year is lamentably small. I believe I am right in saying that the Floral Committee have labelled only one new incurved F.C.C. this season—Ethel Thorp. If we go on at this rate, the progress of cultivation of incurveds will be much slower than that of Japs. and singles. Therefore, let us do all we can to further the advance of one of the most beautiful flowers it is possible to cultivate.

During the remainder of the time at our disposal, I shall be pleased to hear the opinions of those whose experiences have been different from my own, and if any part of my lecture has not been quite clear I shall be pleased to answer any questions on the subject.

DISCUSSION.

Mr. Higgs, in answer to questions, said he would commence to remove the centres of incurved blooms three or four days before the show. Mr. Moorman asked a question concerning damping, but Mr. Higgs averred that incurved blooms suffered little from damp, but Daisy Southam and C. H. Curtis sometimes gave a little trouble. Mr. Ladds said that Emblême Poitevine would damp even during transit in boxes from Swanley to Covent Garden, and asked for a reason for this. Mr. H. J. Jones suggested immaturity of wood, but Mr. Ladds suggested that the hairy excrescences on the petals might bruise neighbouring flowers. Mr. Thomas Stevenson thought that as the flowers were placed in water before being packed they then sweated during their journey. Mr. P. Cragg said that the use of superphosphate in cultivating varieties predisposed to damping would check this tendency in a remarkable manner, and he had found under this treatment (at intervals of three weeks) Emblême Poitevine travelled well.

Mr. Felton expressed his sorrow that so few incurved blooms were now upon the market. Mr. Moorman said that the old mixed classes of Japanese and incurved were responsible for the lack of interest in the latter, as the comparison of the two sections was "odious." Mr. Ladds said that quality for quality incurved blooms realised less money than Japanese. Mr. Thomas Stevenson, Mr. Wells, and others said that the use of vases instead of boards had almost ousted the incurved, moreover, the cost of carriage of long-stemmed blooms——Here both Mr. Jones and Mr. Davis interposed, stating that cultural matters only were under discussion.

A very hearty vote of thanks was accorded to Mr. W. Higgs, and then Mr. Davis came up for cross-examination, but Mr. Davis is such an expert, and had given such a lengthy paper that comparatively few special points were brought out. He considered damping due chiefly to immature growth. Asked whether weak Japanese varieties might be grown two in a pot with success, Mr. Davis said he preferred smaller pots for each plant. Mr. Stevenson thought a very highly matured or ripened wood did not produce the finest flowers, and he endorsed Mr. Davis's remarks that novices should confine their attention to first-crown buds. Mr. Davis said he had a distinct objection to top-dressing in any form, or rather, he found no good results from such treatment.

Mr. P. Craig, who grows largely for market, said they so prepared their soil for chrysanthemums that it should keep the plant going from first to last, arranging the food material to cover the whole period. Mr. Davis said that he could produce twenty good market blooms on a plant with half the manures he would have to use to produce three high-class specimen exhibition blooms.

A vote of thanks to Mr. Davis for answering questions brought the afternoon session to a close.

The evening session of the conference commenced at 6.30. Mr. Thos. Bevan presided, and there were between fifty and sixty members present.

The first paper was by Mr. H. J. Jones, as follows:

METHODS OF EXHIBITING JAPANESE AND INCURVED CHRYSANTHEMUMS.

It is no easy matter to suggest better methods of exhibiting large and handsome exhibition blooms of high quality, owing to the fact that those now in practice have been brought to such a high state of perfection by many of our leading exhibitors. I have a few suggestions to make, which I hope will receive the favourable consideration of this meeting, and will, I trust, be put into practice at future exhibitions.

Before going into this matter, however, it may be well for us to consider what are the points that count in an exhibitor's favour in close and severe competitions. If I understand this question rightly, it is the aim of every grower who exhibits the results of his cultural skill to set up his blooms to the very best advantage. Not seldom, prizes are awarded to growers who arrange their blooms most advantageously, and in such cases an exhibitor with better blooms often finds himself in the second position.

Where the pointing of exhibits is not observed by judges at chrysanthemum shows, an exhibitor who makes the most of the colours of his blooms and studies their skilful arrangement in his stand, frequently scores over his rivals having heavier flowers, but who fail to recognise the value of this consideration. No one can deny that an exhibit that is made to present a bright and attractive appearance often impresses the judges most favourably, although heavier blooms of less pleasing colours, and less attractively set-up, are shown in competition with them.

Quality, however, should always come first, but quality ought not to mean mere size of bloom only, as many growers are disposed to think it should. Quality represents all that is best in a flower. An exhibition chrysanthemum bloom of good quality should be of large size, even form, of good colour, deep in proportion to its breadth, and when finished, of perfect contour. Therefore, when considering the question of methods of exhibiting Japanese and incurved chrysanthemums, it is of the highest importance that the foregoing points should be carefully observed.

With the object of ensuring that blooms of good quality are displayed at their best, so that all these points may be seen by both judges and the public at our shows, they should be arranged, or rather exhibited, so that quality of bloom may have the fullest opportunity of being seen and recognised. It is only by these means that an exhibit can be judged fairly, and justice done to those growers who have laboured for many months to bring their blooms to such a state of perfection, therefore, regulations or conditions for staging blooms should be framed so that this object is attained.

Whilst a great deal of prejudice appears to exist in the minds of some of those who are responsible for the government and control of our leading shows in regard to exhibiting blooms on boards, those who are best qualified to express an opinion are strong in their views that blooms skilfully set up on boards enable both judges and others to see and compare the respective flowers better than any other method now in use. The quality of the blooms is apparent to everyone who can judge the value of these flowers, and growers who are exhibitors, generally speaking, are more satisfied with the decision of the judges in such cases.

I am aware that this method of exhibiting blooms has been described as monotonous, but, does not the same remark apply with equal force to blooms staged in vases, as now exhibited at all the leading shows. In my opinion, the method of exhibiting large Japanese and incurved blooms in vases leaves much to be desired. Three or five blooms arranged in one vase, as now generally practised, is distinctly detrimental to the cultivation of the chrysanthemum in its widest sense. The difficulty is to arrange the flowers satisfactorily. The vases that are usually provided at our shows are quite unsuited for the purpose, and it is next to impossible to adjust the blooms in such a fashion as to display the full proportions and true character of each individual specimen satisfactorily. The larger the flowers, the more difficult are they to arrange effectively. A point not to be overlooked is the fact that, in encouraging the vase classes, as now constituted, the number of varieties at our exhibitions is of an extremely limited character.

The leading class at the great November festival at the Crystal Palace is for twelve vases, each vase to contain three blooms of one variety, i.e., twelve varieties only, out of the many hundreds of varieties that are generally cultivated. The N.C.S. cannot regard itself as really promoting the cultivation of the chrysanthemum, when one of its leading classes is confined to an exhibit of twelve varieties only. Another most important fact in connection with the limited numbers of varieties staged in the vase classes is the practice of staging only the giant varieties to the exclusion of many handsome varieties of beautiful form and grand quality. Growers have come to recognise that the judges pay more than proper respect for mere size, and on this account only the largest varieties are exhibited, and in a series of entries varieties are duplicated, triplicated, and so on correspondingly with the number of exhibits staged. As an instance of what I mean, how frequently do we see vases of Hon. Mrs. Lopes, Lady Talbot, F. S. Vallis, Reginald Vallis, Mdme. Paolo Radaelli, Mdme. G. Rivol, etc., exhibited in the vase classes, simply because they are the largest, and most impressive in consequence. Surely there is equal quality recognisable in varieties such as W. Gee, Frank Payne, Mrs. G. Mileham, Mrs. C. Beckett, Superb, Mrs. Trevor Williams, Captain Julian, Evelyn Archer, Keith Luxford, W. Beadle, etc., etc. Until quality of equal value is recognised in these rather smaller flowers, we shall not be doing what is fair and just to the chrysanthemum while so many beautiful varieties like these are practically excluded from the vase competitions.

Far better would it be to encourage the exhibition of large flowers of good quality in individual vases. We do not want so much repetition of varieties in the different exhibits, rather should we desire to encourage the cultivation of a greater number of varieties. This would have the effect of taxing the skill of the cultivator, and would ensure the representation at our shows of a greater number of varieties, which would also have the effect of making our chrysanthemum shows far more interesting for this reason.

The vase classes as at present constituted provide for the exhibits to be arranged in long straight lines, and somewhat top-heavy arrangements. Between the vases are unduly big, unlovely blank spaces, of which no advantage is taken, and there is a distinct loss in not providing something to remove the barrenness of this system of arrangement. I therefore return to my recent suggestion of exhibiting large blooms individually in vases. I know of no method to equal this for representing each individual flower in its true character, and, after all, this is the aim of every exhibitor, and is one of the chief objects which chrysanthemum societies are created to foster.

This system of setting up individual blooms appeals very much to an exhibitor with original ideas, as he can dispose and adjust his blooms individually in such a fashion that an exhibit as a whole can be made a thing of beauty. Such a method of exhibiting would have the effect of simplifying the work of exhibitors when they reach the show, as the setting up of blooms in position could be done much more easily, and the full beauty and quality of each specimen could be determined with comparative ease. This method would practically allow of a diversity of arrangement, and, doubtless, would have the effect of bringing into prominence something novel and that might be quite worthy of emulation.

As an illustration of decorative effect achieved when the exhibitors have had the opportunity given them, I would point to the exhibition of single varieties at the great show at the Crystal Palace in November last. Which was the most pleasing and artistic— the table of singles arranged according to the exhibitor's taste, or twelve varieties of singles set up in the orthodox straight rows? I maintain that the table was a great advance.

I would, therefore, suggest that classes be created either for groups of cut chrysanthemums, a given table space, or of a specified number of blooms, leaving it to the originality of the exhibitor to make the most of his space. There is latent artistic ability in many of our best exhibitors, and I feel sure if such classes were made, and suitable prizes offered, we should see some really artistic methods of grouping large flowers, and the unrivalled beauty of the "Autumn Queen" would be displayed at its best.

As an illustration of what I wish to convey, I cannot do better than refer to a class provided at the show of the Dulwich Chrysanthemum Society. I was much struck with the exhibits in this competition. The class in the schedule provides for "A table of chrysanthemums, any varieties, 4ft. by 3ft., to face three ways, arranged with foliage plants." This class gave some of the most beautiful exhibits of large chrysanthemums I have ever had the pleasure of judging. It is a method that should be adopted by every chrysanthemum society that desires to be up-to-date, and to prove the decorative worth of big blooms. Exhibits of this character, and others of a kindred nature would be heartily appreciated by the general public, and they would result in serving the purpose of object-lessons to those who are at a loss to know how to arrange big blooms of high quality. Whilst I justly praise the method of our forward affiliated society; the competitions suitable for our national show should be altered or modified in some respects.

I would suggest that classes respectively for twelve, twenty-four, or forty-eight blooms, more or less distinct, should be set up in this way for effect. Classes for both Japanese and incurved blooms could be provided, and their value as decorative material proved in no mean degree. The blooms could be set up individually in vases, and be disposed in any manner that the exhibitor in his discretion thinks well. Disposed in pleasing and artistic fashion amongst the blooms, foliage plants or cut foliage should be arranged effectively. An extremely simple utensil for exhibiting in this fashion is the "Godfrey tube." This contrivance can be inserted in the ball of soil of the pot foliage plants if desired, and the work of arrangement simplified by those means. Exhibits staged in this manner are fraught with great possibilities. More space would be required at our show for the respective classes, and in the aggregate, the exhibition would appear to be much larger and certainly would be more comprehensive in its character. A lesser number of classes would be needed, so that, were larger prizes necessary in order to encourage competition in the new classes, the money saved on the classes that had lapsed would provide the further sum needed for the new classes.

I can imagine the effect of a show embracing a series of classes staged in the manner that I have suggested. It would be a revelation, and would please everyone. The admirer of big blooms would see the chrysanthemum at its best, associated with foliage plants or cut foliage that would enhance their beauty, and the strongest opponent of the big bloom cultivation would have no argument to use because the handsome flowers would be represented in such charming fashion.

The exhibits facing three sides, as suggested, would necessitate a space being allowed between each exhibit: this would have the effect of making them more attractive, and would result in a really beautiful artistic display.

DISCUSSION.

Mr. Felton agreed with Mr. Jones' suggestion of setting up big blooms singly in vases, set up among foliage and foliage plants. Mr. D. B. Crane deplored the comparative lack of variety at chrysanthemum shows, because of the frequency with which the very largest blooms are displayed; he hoped some of the equally beautiful but rather smaller varieties now in existence would be better represented. Mr. Ladds suggested that the Floral Committee should classify varieties as extra large, large, and medium, and follow this up by arranged classes for the sections. Mr. Jones asserted that the vase classes were killing the trade, and if the trade failed to receive support then chrysanthemum shows would suffer, the one was dependent upon the other. Mr. Davis deplored the present tendency of the executive towards decorative varieties. The English gardener, he considered, thought more of the flower as a florist's flower, while the French gardener considered flowers for their decorative beauty. He stated that chrysanthemum shows were failing, and had failed, because they had done away entirely or largely with show boards. He thought the shows should be divided into two parts, i.e., the cultural side and the art or decorative side. Mr. Wells thoroughly endorsed the views of both Mr. Jones and Mr. Davis, and pointed out that while an amateur could easily bring his six or twelve blooms on boards to a show with ease, he could not, for reasons of expense, etc., bring an equal number of long-stemmed flowers.

Mr. Stevenson urged that the society should lay down rules for judging; he believed that the withdrawal of boards was spoiling shows, chiefly because of the immense expense incurred by the carriage of long-stemmed blooms. Mr. Stevenson further remarked that a medium-sized variety of refined form should, if at its best, receive full points, just as a fine bloom of a big variety should. Mr. Crane pointed out that the Floral Committee was formerly accused of being too generous, but now it was accused of being too niggardly—this was interesting. The Chairman referred to the beautiful arrangements of big blooms at Paris, etc., and indicated what a wonderful display of a wide range of varieties without offering any cash prizes whatever. He said that these long-stemmed flowers were packed dry in light boxes, and not carried upright in water, and the method appeared to be very successful. In his remarks, he showed that his sympathy was with vase classes against the board classes. Mr. Ladds wanted to know how the French people packed and carried their long-stemmed in such easy fashion as suggested by the chairman—but no answer was forthcoming.

Thanks were then accorded to Mr. H. J. Jones.

USE OF LARGE BLOOMS IN FLORAL DECORATION.

Mr. Felton, who had this subject in hand, dealt with it rather humorously, but he said that all chrysanthemums were useful for some kinds of floral decoration, as they gave a wonderful range of colour and variety. They also give an immense graduation of shade in each colour, and that was why it was so invaluable for floral arrangements, and permitted delightful combination. He said he had never seen a pink chrysanthemum, though custom had sanctioned the use of the colour description. Why, he said, should the chrysanthemum be the only flower condemned because of its size? He said that it was the masses of soft, poorly-grown, and poorly-packed chrysanthemums that were killing the trade, and making so many people disgusted. High culture was the great need all round. "Do not grow more than you can grow well" was a dictum that Mr. Felton laid down with great emphasis, and one which he elaborated at some length. "Everything that is artistic is proportionate" was another aphorism. Huge blooms were not suitable for small tables, nor were small ones suitable for huge and bold arrangements. "A big bloom badly grown is a floral monstrosity" was another quaint remark. Blooms about six inches across were, he considered, the size most generally useful to florists. Regarding sprays of chrysanthemums, Mr. Felton illustrated his remarks by selecting good and bad sprays, and showing that certain varieties are good and others useless for this purpose, and this demonstration was greatly appreciated. He thought the small flowers sent to market should not be poor flowers of really large varieties, but those that naturally have small flowers: Lizzie Adcock, Clinton Chalfont, Source d'Or, Tuxedo, Cullingfordi, Mr. Gilbert, Heston White, Allman's Yellow, Framfield Pink, Princess Victoria and its sports, Victor Lemoine, and Putney George. He asserted there was no place for rubbishy flowers or varieties, and growers for market were largely to blame for filling the market. Felton's Favourite, Dazzler, December Gold, Mdme. T. Panckouke, Freda Bedford, W. J. Crossley, and Western King he gave as excellent medium-sized flowers. Clara Wells, Mrs. J. Hygate, Nellie Southam, Buttercup, Pantia Ralli, and Frank Tristrian he characterised as excellent incurved varieties for decoration. Algernon Davis, F. S. Vallis, Mdme. Rivol, Mdme. P. Radaelli, W. Iggulden, W. Jinks, Mrs. Lopes, Lady Talbot, and Bessie Godfrey were among the varieties he considered the best for the largest Japanese blooms. Mr. Felton then described a fine decoration he recently carried out at the Connaught Rooms with big grandly-grown chrysanthemum blooms.

The Chairman asked Mr. Felton how he used big blooms, and he pointed to a huge vase of big blooms with a few smaller ones below them, arranged in a hall by Mr. Leech, as a good example—a fine compliment to Mr. Felton. He thought the modern single chrysanthemums were inclined to be too large; Mensa was quite large enough for decorative value. A vote of thanks was accorded Mr. Felton.

LATE-STRUCK JAPANESE CHRYSANTHEMUMS FOR EXHIBITION.

The above was the title of Mr. Thomas Stevenson's excellent paper, the last of the session. We hope to publish this in extenso shortly.

It was 8.30 by the time Mr. Stevenson had finished. A few questions were put and answered, chiefly with respect to training and stopping. Messrs. Ladds, Davis, Howe, H. J. Jones, and others took part in the discussion. A vote of thanks to Mr. Stevenson and one to the chairman concluded the proceedings.

Bournemouth Gardeners' Association.

At the fortnightly meeting held on December 6 an exhibition of Begonias Gloire de Lorraine, and zonal pelargoniums was held. Some really splendid specimens of begonias were staged; the plants weighed down with blossom, and the trusses large. Mr. Pearce was first with a heavily-flowered plant, Mr. W. Shave coming a close second with a beautifully-trained specimen, and Mr. Nippard third with a smaller, but well-flowered plant. Mr. Pearce also exhibited five large plants, but little inferior to the one he had in the competitive class, and was deservedly awarded a first-class certificate. Mr. Nippard was first-prize winner in the class for six varieties of zonal pelargoniums, three trusses of each, arranged in vases with any foliage. The blooms were large and very fresh, the varieties being Souvenir de Mirande, Dryden, General Wolseley, Lady Brook, Mark Twain, and Andrew Lang.

The potatoes shown by the hon. secretary, Mr. J. B. Stevenson, were very fine ones, and showed that large, clean tubers could be grown in the light soil of Bournemouth without even the addition of heavy dressings of manure. A hearty vote of thanks was passed to Mr. Stevenson for bringing the potatoes. He also staged some well-coloured Golden Noble apples.

The evening was devoted to questions and answers, and proved to be a highly interesting and instructive one. Questions were written on slips of paper by the members present, placed in a box, and then read as taken out by the chairman. Many questions were dealt with. We can only refer to one or two here, but all were of interest. In replying to the question as to the best treatment of Impatiens Sultani, Mr. Stevenson said he sowed the seeds in March and planted out the resultant plants about the middle of June as bedding-out plants in the public gardens, and they were a decided success. The best method of propagating Begonia Gloire de Lorraine was another question of interest. Nearly all the members present favoured propagation by leaves, retaining the leaf-stalk to prevent the leaf damping through contact with the soil. Other questions were, "What is a decorative chrysanthemum?" "Which is the best way to feed chrysanthemums?" "Did the common privet attract white fly?" and "Should tomatoes be fed with cow manure?" Mr. Richards ably presided, and was heartily thanked at the close of the meeting.

National Rose Society.

The annual general meeting of this flourishing national floricultural society was held on Thursday, December 8, in the Norfolk Room of the Westminster Palace Hotel, Westminster. There was a good attendance, presided over by the outgoing president, the Rev. F. Page Roberts. Notable members present included: The Rev. J. H. Pemberton, Rev. F. Burnside, Rev. F. Powley, Dr. Williams, Dr. Shackleton, Mrs. Mawley, Mrs. Page Roberts, and Messrs. C. E. Shea, G. Gordon, H. Molyneux, G. W. Burch, G. W. Cook, G. Bunyard, G. Paul, W. Taylor, E. F. Hawes, — Doncaster, J. Collingridge, Conway Jones, W. Easlea, J. Mattock, G. Prince, H. Dennison, Cecil Cant, H. Mount, — Prior, R. Harkness, Frank Cant, E. J. Holland, A. Tate, R. F. Felton, J. T. Strange, H. Darlington, etc.

The meeting was opened with the usual formalities. Dr. Williams and Mr. B. Cant were appointed scrutineers of the ballot. The Rev. F. Burnside asked to be replaced as a vice-president of the society, and Mr. A. Hill Gray as a judge, and said that both he and Mr. Gray had for long supported the society, and continuously exhibited, and also secured new members. While the ballot was being taken, Mr. Mawley read the annual report, and Mr. G. W. Cook the financial statement, which were practically as follows:

REPORT OF THE COUNCIL FOR 1910.

In presenting their report for the past year the council direct attention to the fact that for the first time in the history of the society the number of new members has reached 1,000. This is most encouraging, as it shows that the number of amateurs keenly interested in rose culture is still on the increase, and that they find the publications and other advantages offered by the society helpful to them.

The Metropolitan exhibition, now one of the recognised attractions of the London season, was again held by the kind permission of the president and council of the Royal Botanic Society in their gardens in Regent's Park. It took place this year on July 8, and proved the largest but two the society has yet held. The most noteworthy feature of the show was the great interest taken in the new seedling roses, for the exhibition of which a separate tent had been for the first time provided. In carrying out the arrangements for the exhibition the council, as in previous years, were well supported by the officers and staff of the Royal Botanic Society.

The provincial show was held at Salisbury on July 13. This was also a successful exhibition, and the average quality of the blooms was very good. The arrangements for the exhibition were admirably managed under the able direction of the hon. secretary of the Wilts Horticultural Society, Mr. L. J. Sly.

The autumn exhibition, the seventh of the series, again took place in the Royal Horticultural Hall, Vincent Square, Westminster. The average quality of the exhibition roses was not quite as good as at some previous autumn shows, but there were several striking displays of decorative roses, and the large representative groups against the walls have never before been better or more tastefully arranged.

Her Majesty Queen Alexandra, the Royal patroness of the society, has for several successive years honoured the society, and marked her interest in its doings by paying a visit to the Metropolitan show. These visits have always been keenly appreciated by the council and members generally. This year, owing to the lamented death of his late Majesty King Edward VII., our Royal patroness was unable to be present. The address of condolence presented by the council on behalf of the society was graciously acknowledged by her Majesty.

Early in the year fresh rules for judging new seedling roses and distinct sports were drawn up, and appear to have given greater satisfaction than any previously framed.

The council have not only promised a donation of £50 towards the prizes offered in the rose section of the International Horticultural Exhibition in 1912, but at the request of the committee submitted a schedule of the rose classes they considered most suitable considering the time of year when the show will be held.

The 1910 edition of the "Enemies of the Rose," and the "Rose Annual for 1910," were distributed to the members in April, while the 1910 edition of the "Hints on Planting Roses" was sent them in September. Our warmest thanks are due to the members of the Publications Committee, who have devoted so much time and care to these publications so helpful to members.

At the last annual general meeting the Dean Hole Memorial Medal was presented to the Rev. J. H. Pemberton, vice-president of the society, for his services, extending over more than thirty years, on behalf of the rose and the National Rose Society.

The council record with regret the death during the year of Mr. John Cranston, one of the original founders of the society. He was for many years a member of the General Committee, and was greatly respected and beloved by all who knew him when head of the King's Acre Nurseries, Hereford. Mr. Cranston in the early days of the society was the most frequent winner of the first prize in the leading class for nurserymen

During the past twelve months 1,050 new members have joined the society, or 150 more than in 1909. Allowing for the losses by death and resignation, the total number of members is now 4,584. Taking the year as a whole, nearly three new members a day have been, on an average, added to the list of membership.

	1905.	1906.	1907.	1908.	1909.	1910.
Number of Members......	1,637	2,034	2,484	3,150	3,797	4,584
Net increase since Previous Year .	329	397	450	666	647	787

As in the previous year, fifty-five rose and other horticultural societies are in affiliation with our society.

The Metropolitan Exhibition of 1911 will take place in the Royal Botanic Gardens, Regent's Park, on Friday, July 7. The provincial show will be held at Ulverston, in conjunction with the North Lonsdale Rose Society, on Wednesday, July 19. It will be then ten years since the society last held an exhibition in that district. Arrangements have been made with the Royal Horticultural Society to hold the autumn show in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, September 14.

During the coming year the following publications will be issued to the members: The "Rose Annual for 1911," the new edition of the "Handbook on Pruning Roses," and the new edition of the "Official Catalogue of Roses."

The council tender their best thanks to all those who have again so kindly presented special prizes, as these special prizes always contribute so much to the interest of the exhibitions. They also acknowledge with thanks the good work done by some of the hon. local secretaries, and especially desire to mention Mr. H. E. Molyneux (Purley), Mr. R. E. West (Reigate), and Dr. A. H. Williams (Harrow), and more particularly Mr. R. E. West, as having been the most successful in obtaining new members. The council also gratefully acknowledge the continued kind interest taken by Miss Willmott, V.M.H., in all matters concerning the welfare of the society.

SUMMARY OF RECEIPTS AND PAYMENTS
FOR THE YEAR 1910.

1909 Dec. 1.

I have compared the foregoing Statement with the books and vouchers, and hereby certify the same to be correct.

The Cash Balances and the securities representing the investment of the Reserve Fund of the Society have been verified by me.

CHARLES BRANNAN,
Chartered Accountant.

Mr. Cook said that the society only owed £40, all told, and against this were assets of about £146. There were 573 prizes offered at the several shows, and there were only 163 prizewinners. £1,305 was expended on shows and prizes, and £344 4s. 6d. received as gate money, prize money, etc., or, in other words, the shows cost the society about £1,000, and the publications about £580. The latter went to every member, but the prizes to only 163 members.

The President made very few remarks in moving the adoption of the report and balance-sheet, and the motion was seconded by Mr. H. E. Molyneux, who paid a high compliment to the treasurer. Mr. Molyneux thought the Finance Committee might consider the question of expending more money in the cause of the rose, and find some special method of advancing roses and rose cultivation,other than those already adopted. Mr. C. E. Shea said if the council suggested methods the Finance Committee would have to consider ways and means. He agreed that a big reserve was not needed, and after a reasonable amount was put by the question of spending the balance in advancing the interests of the society should be considered. Mr. Holland thought the reserve fund should be made a substantial one, in view of possible bad times, and he pointed out that the great increase of income was due to the large accession of members. A proper balance must be drawn between expenditure on exhibitions and on publications—the two being necessary.

The motion was then put, and carried.

An honorarium of £100 was voted to Mr. Mawley, the hon. secretary, on the motion of Mr. G. W. Cook and Mr. C. E. Shea. Mr. Mawley returned thanks, and had a very hearty reception when so doing.

A motion to alter and add to the rules in such a way as to secure the retirement of a part of the council annually was down in the name of the Rev. J. H. Pemberton, but was withdrawn. Another motion referring the subject to the General Purposes Committee to report upon to the council, so that the matter could be arranged, and be in working order before the next annual general meeting was adopted. Various speakers considered the retirement of part of the council and officers annually would provide opportunities for the election of newer members, and the infusion of new life into the governing body.

Mr. G. Bunyard and Mr. Pinches moved the thanks of the society to the officers and members of council, and Mr. Mawley suitably responded. The President having notified that the house list of members had been elected, with the addition of the Rev. F. Burnside to the vice-presidents, he then, in a few appropriate remarks, concerning the wonderful work done by the hon. secretary, then presented on behalf of the society, the Dean Hole Memorial Gold Medal to Mr. Edward Mawley. Mr. Mawley suitably responded, and said that he very gratefully appreciated the award made—the most coveted one in the rose world.

Mr. G. Gordon moved a vote of thanks to the Rev. F. Page Roberts, for his presidency, and said that he thought Mr. Page Roberts had combined all the good qualities of the three that had preceded him. Mr. Darlington seconded the motion, and it was carried with hearty unanimity. Mr. Page Roberts very humorously replied, and said he had had an easy task, and a pleasant one, in the presidential chair. He had reluctantly accepted office, and he now as reluctantly retired from the honourable position. He then asked the Rev. J. H. Pemberton, the newly-elected president, to take the chair, which he did, and thanked the meeting for his election.

National Vegetable Society.

As briefly intimated in our issue of the 10th inst., the annual meeting of this newly-constituted society was held at the Horticultural Hall on the 6th inst., Mr. Alexander Dean, V.M.H., occupying the chair. Mr. E. G. Quick, the hon. secretary, having read the notice convening the meeting,

The Chairman moved the adoption of the report, which, having been distributed to the members present, was taken as read. He said he had much pleasure in moving the adoption of the report because it showed that much excellent work had been accomplished, and those who were actively interested in vegetables and vegetable culture fully appreciated the work that had been done by the society. The report, as the members would see, contained much information relating to the trials, and he felt that the members generally should feel grateful to the firms who had supplied the seeds, and also to those by whom they were carried out. The show, he said, gave great gratification to all who had an opportunity of seeing it, and the magnificent display that was produced justified their looking forward with a spirit of hopefulness to the future. The membership was considerable, but it was not sufficient for a society engaged in such important work as that which the National Vegetable Society had undertaken, and he urged those who were interested in the society and its work to bestir themselves and bring in new members. They had received generous support from the seed trade, and the heartiest thanks of the society were due to the firms who had contributed special prizes, and also to the noble president, the Duke of Portland, and other donors of special prizes. Mr. O. Thomas, V.M.H., the vice-chairman, seconded the motion for the adoption of the report, and said he fully shared in the gratification that had been expressed by the chairman with regard to the splendid results of the first year's work. He trusted that the seedsmen and other friends would support the society with the same degree of liberality next year as in that which was passed. After a short discussion, the report was adopted.

Briefly summarised, the report was as follows:

During the autumn of 1909 and the spring and summer of 1910, trials of cabbages, autumn-sown onions, and early potatoes have been made, and full reports of the results of these have been published in the horticultural press. These trials were conducted respectively at Twickenham, Middlesex, Sutton Green, Surrey, and Romford, Essex, and the committee's warmest thanks are given to Mr. W. Poupart, Marsh Farm, Twickenham, for his great kindness in so admirably conducting his trials; to Mr. Charles Foster, the Times Experimental Station, Sutton Green, Surrey, for similar and most valuable services; and to Mr. G. Hobday, Romford, for his trial of cabbages.

An exhibition of vegetables was held in the Royal Horticultural Society's Hall on September 28 last, when the finest display of vegetables ever seen in this country was produced, and the committee have much pleasure in reporting that from every standpoint the show was an unqualified success. Visitors, although not so numerous as the committee would have liked, were present in fairly large numbers, and considerable interest was taken in the various exhibits that were staged on that occasion. On every hand earnest hopes have been expressed that a similar exhibition will be held annually.

Considering this is the first year of the society's existence the finances are in a sound condition. The total receipts for the year were £229 14s., and the total expenditure £201 8s. 6½d., leaving a balance in hand on September 30, of £28 5s. 5½d.

The total number of members of the society, including vice-presidents, is now 166, and the committee earnestly hope that every member will try and obtain at least one other new member By this means the membership of the society would be rapidly increased, and the committee would then be able to undertake more work for the benefit of vegetable growers in general.

Trials of early cauliflowers, early peas, beetroots, carrots, as well as onions to be sown under glass, and subsequently transplanted, have been arranged for the ensuing year. These will be conducted with the same impartiality as has characterised the trials which have been held during the past year.

Owing to the Royal Horticultural Society having selected September 26 for their vegetable show next year, the committee have arranged for the annual exhibition to be held at the Horticultural Hall on Wednesday, August 30.

To the donors of special prizes, and particularly the President, his Grace the Duke of Portland, the committee desire to tender their best thanks, and the warmest thanks are due to the treasurer, Mr. G. Wythes, V.M.H., for the efficient and valuable services he has rendered. The work of the hon. secretary, Mr. E. G. Quick, has been arduous in the extreme, and the sincere thanks of the members in general are due to him for the efforts he has made in furthering the interests and work of the society. As a slight recognition of his valuable services, the committee recommend that an honorarium of ten guineas be granted to Mr. Quick. The committee also desire to thank Mr. Pinches for kindly assisting in examining the accounts in conjunction with the chairman.

The election of officers and members of committee was then proceeded with, and in the result the Duke of Portland, K.G., was re-elected president; and Mr. A. Dean, V.M.H., Mr. O. Thomas, V.M.H., Mr. George Wythes, V.M.H., and Mr. E. G. Quick were re-elected chairman, vice-chairman, treasurer, and secretary respectively. The members of committee were also re-elected, and Mr. Horace Wright, Mr. Gentil, and Mr. Grubb were added to the committee. Messrs. Pinches and W. Wilson were elected auditors.

Mr. E. G. Quick stated that, judging from the promises he had received, the seed firms would support the society even more liberally than in the past year. In addition to those whose names have been mentioned, Mr. E. Beckett, V.M.H., Mr. George Gordon, V.M.H., Mr. W. A. Cook, Mr. J. Harrison Dick, Mr. F. W. Harvey, Mr. J. Jaques, Mr. H. Markham, and Mr. Mortimer took part in the proceedings, which were brought to a close by a hearty vote of thanks to the chairman.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, December 6.

Present: E. A. Bowles, Esq., M.A., F.L.S., F.E.S. (in the chair), Messrs. W. C. Worsdell, A. Worsley, G. Gordon, J. T. Bennett-Poë, J. Fraser, J. Odell, and F. J. Chittenden (hon. secretary).

FRUITS OF EUCALYPTUS AND ALLIED PLANTS.—Mr. Worsdell showed the fruits of Eucalyptus ficifolia, in which they are quite simple; E. cornuta, where they are partially united; syncarpia, where they are formed from five or six fused flowers; and Agonis flexuosa, where they are very densely aggregated. The fruits, which had been collected by Mr. Worsdell in South Africa, showed in an interesting fashion the variation in fruits which may be seen in nearly-allied plants.

STACHYS AMBIGUA. — Mr. J. Fraser showed specimens of this plant, a hybrid between S. sylvatica and S. palustris, and commented upon the characters wherein it differed from its parents.

KALE WITH SURFACE OUTGROWTHS.—Mr. Bowles showed a leaf of Scotch kale from Mr. Cowan, of Penicuik, with outgrowths from its upper surface somewhat like those often seen in cabbage and termed ascidia. In the present case, however, the growths were fringed at their edges and considerably crisped.

TAR-WATER AND PLANTS.—Mr. F. Kitley, of Bath, sent two plants of coffee, one of which had been watered with tar-water a few times, the other not. The former showed much more vigorous growth, the latter had apparently not been quite equal to the former at the start and had been stopped. While it is probable that tar-water would have some such effect as was shown, the committee thought that the particular specimens were hardly comparable with one another.

Highcliffe Gardeners' Association.

A lecture on "Vegetables for Large and Small Gardens" was given by Mr. George Garner on Monday, December 5, before the members of the above association.

Mr. Garner first dealt with the matter of treatment of soils, strongly advocating the trenching of ground, especially where it is of a clayey nature.

The applications of organic and artificial manures were also dealt with. The lecturer recommended cultivators to freely manure heavy soils in the autumn with farmyard manures, but to defer the application of such manures until the spring in the case of light or sandy soils. He also gave a list of manures suitable for various crops as follows: For potatoes, in addition to farmyard dung, 2lb. sulphate of ammonia, 4lb. superphosphate, and 2lb. kainit per 40 square yards of ground. Tomatoes, not much of any organic manure, but 3ozs. of superphosphate to each bushel of compost and a 6in. potful of wood ashes, also a teaspoonful of superphosphate to each plant once a fortnight while the plants are bearing the fruits. Onions, fowl manure in the autumn at the rate of 2 pecks per square yard of ground and 1 peck of lime per square yard. In the spring, or just prior to the sowing of the seeds, a good sprinkling of soot. When the crops are growing freely, and while the soil is in a moist condition, 2 ozs. of superphosphate, 1oz. of kainit, and a similar quantity of nitrate of soda per square yard. One application of nitrate will be sufficient.

In the case of root crops such as carrots, parsnips, and beetroot, no green manures should be used late in spring; but the ground should be well manured with well-rotted material during the autumn, said the lecturer. Intercropping, rotation cropping, the treatment of winter greens, potato disease, peas and beans, were other subjects dealt with, and at the close of the lecture Mr. Garner gave a concise list of varieties of vegetables to grow.

A discussion took place, and hearty votes of thanks to the lecturer, and Mr. Wheeler, who ably presided, brought a very pleasant evening to a close.

This association is comparatively young, but it is rapidly becoming very strong, and is doing good work in the Christchurch district, which is noted for its many fine gardens.

Woolton Gardeners' Society,

The usual meeting of this society was held on the 8th inst. in the Mechanics' Institution, Mr. W. D. Skinner being voted to the chair.

The lecturer and demonstrator was Mr. W. H. Paine, Kildare, Ireland, who selected for his subject "Alpine Plants and their Culture." A large number of specimens were under review, and their native habitats were given, the means of propagation by seed, cuttings, divisions, etc., were shown and explained. The kinds suitable for pot or rockery culture were given, after which a miniature rock garden was constructed and planted, advice being given as to the most suitable positions for the various kinds of plants that were submitted. A selection was given of plants that were proved to be quite hardy in the Emerald Isle, and yet that required the protection of the greenhouse in this country. Bulbs, although not treated upon, were stated to give most successful results in rock gardens. On the motion of the chairman, seconded by Mr. R. G. Waterman, a cordial vote of thanks was tendered to Mr. Paine for his valuable and interesting lecture.

Shrubby Veronicas.—These are extremely pretty in the autumn, and where they are hardy outside they form handsome bushes. Where the winters are too severe for them to be treated in this way, these veronicas form a welcome addition to greenhouse flowering plants. Neat examples may be grown in pots five inches in diameter, or fair sized bushes may be obtained by using larger pots. There are now many varieties, varying in colour from pure white to rich purple. Besides these, some of the shades of crimson and of pink are very pleasing. Being so hardy, these veronicas can, of course, be stood out of doors throughout the summer months.—W. T.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

POTATO EXPERIMENTS.—E. G. J.: The National Potato Society was dissolved nine years since. It may be that you mean the National Vegetable Society, and if this be so the secretary's name and address is Mr. E. G. Quick, Kelmscott, Harrow View, Wealdstone, Harrow.

USE OF GAS-LIME.—Mr. G. Chambers writes from Southampton: "I wish to heartily thank you for the information I have obtained from your valuable paper, more particularly with regard to advice on the use of gas-lime. I have been using gas-lime in my garden, the soil of which is very wet in the winter, resting as it does on a clay subsoil. I was always, previous to its use, troubled with club-root, sometimes losing nearly all my broccoli and cabbage plants during the summer months. The district in which I reside is much subject to this disease. For two years I have used gas-lime, giving a good dressing two or three months before the planting time, and with excellent results. I find the gas-lime has a most favourable influence upon the growth, and this year many plants range from two to three feet in height." We are pleased to hear of our correspondent's success in his endeavour to checkmate the club-root, and are much obliged to him for his note, as it may induce other readers to take advantage of the aid gas-lime is able to render in preventing the spread of the disease.

NOVELTIES AT WESTMINSTER.—H. W., Shotley: The Royal Horticultural Society's Floral, Fruit, and Orchid Committees meet at the Horticultural Hall fortnightly, and carefully consider the merits of novelties that are submitted to them, and award first-class certificates and awards of merit to such as they consider worthy of distinction. First-class certificates are not awarded by the Floral Committee to varietal forms. The dates and times of the meetings are given in the GARDENERS' MAGAZINE week by week. If you write to the Rev. W. Wilks, M.A., secretary of the Royal Horticultural Society, Vincent Square, Westminster, London, S.W., enclosing stamp for postage, you will obtain official information relating to the exhibition of novelties.

OUTDOOR VINES.—Enquirer, Hampshire: The grape vines, if growing against a wall may be trained horizontally or upright, as you may prefer, or they may be trained diagonally. In either case the principal rods should be from twenty-four to thirty inches apart. If they are growing in the open it is a very good plan to train the main rod horizontally at a distance of about fifteen inches from the ground, and take up about four rods from it at a distance of two feet or thirty inches apart, and train them up stout stakes. The stakes should stand between four and five feet out of the ground. The vines should be trained horizontally previous to growth commencing, and when it has commenced all the buds on the underside should be rubbed off. The strong buds on the upper side at the requisite distances apart should be selected, and the others be removed. Four upright canes to each rod will be sufficient. Without exact information as to the strength of the canes of your vines it is not easy to speak definitely, but we are inclined to the opinion that the best course will be to cut the canes back to a prominent bud a few inches above the surface of the soil, to remove all the growths but

Fruit Pergola as recently erected.

Why not a Fruit Pergola next year?

Charming effects and excellent results can be obtained by training fruit trees on our improved Arched Espaliers. Order now, and get your fruit trees planted in good time.

BROWNE & LILLY
PORTABLE BUILDINGS.

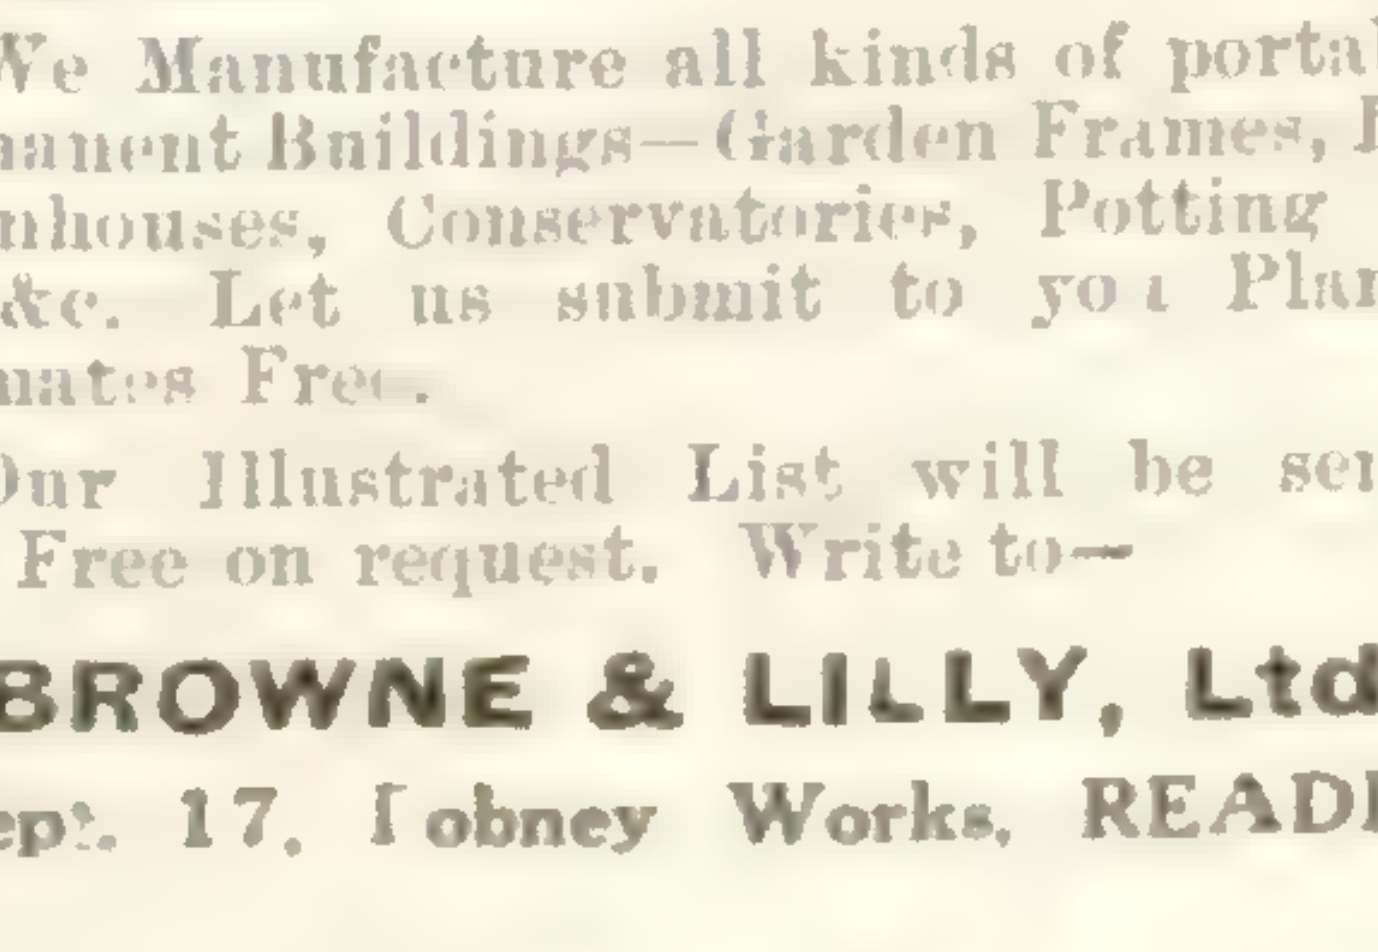
WITH Material right, Workmanship right, and the experience of years, it certainly is no wonder that we are able to manufacture Portable Buildings of real—honest merit.

Few, if any, Portable Buildings withstand wear and weather as our Structures do, few give the service that our specialities give, and certainly no others give a tithe of the satisfaction.

We Manufacture all kinds of portable and Permanent Buildings—Garden Frames, Lean-to Greenhouses, Conservatories, Potting Sheds, &c., &c. Let us submit to you Plans and Estimates Free.

Our Illustrated List will be sent you Post Free on request. Write to—

BROWNE & LILLY, Ltd.,
Dept. 17, Tobney Works, READING.



one from each vine, and to train the cane to upright stakes about eight feet high, and nip out the growing point when they reach the top. This will induce them to swell up the lower buds, and ripen more satisfactorily during the summer. They can then be trained horizontally in accordance with the suggestions made. The laterals should be thinned in spring, and those remaining stopped during the summer two or three leaves beyond the bunch. Grape vines growing in the open invariably fail to ripen satisfactory crops when the growth is not carefully regulated.

HYDRANGEA PANICULATA GRANDIFLORA.—Anxious Enquirer, Hampshire: Lift the plants at once and cut the growths back to a prominent bud within a few inches of the base. Put them in pots proportionate to their size, and use good turfy loam, to which small proportions of well-rotted manure and leaf-mould have been added. Plunge the pots to their rim on a bed of coal ashes, and attend carefully to the watering. They will require very little water until growth commences in the spring, but the soil must be maintained in a moderately moist state.

PROGENY OF BRUSSELS SPROUTS.—F. B., Woodford Green, writes: "In the spring of 1908 I put out a bed of Brussels sprouts, and among them was a plant tha only grew to about one-half the height of the others, and produced a large cabbage on the top, but had no sprouts on the stem. The cabbage was cut and used, and I then moved the stem to another part of the garden, and let it run to seed that year. In February last I sowed some of the seeds in a box, and the plants raised therefrom were put out at the same time as the Brussels sprouts raised in the usual way. Some are Brussels sprouts, some are Cottager's Kale, and some have the cabbage head like the plant from which the seed was saved. I should be glad if you would tell me if this is anything unusual." It is not usual for Brussels sprouts raised from seed obtained from a carefully selected stock to produce plants bearing large cabbage-like heads, although, breaks do occasionally occur. But in the case of brassicas raised from seed that has been saved at home without special precautions being taken to prevent cross-fertilisation with other types, it is a quite common occurrence for the resulting crop to show a remarkable divergence of character. Two or three years ago a friend of ours saved seed from two or three specially fine plants of Brussels sprouts, and the following year, instead of having one of the finest breadths of Brussels sprouts, as he anticipated, notwithstanding our warning, he had a quarter containing Brussels sprouts, savoys, cottager's kale, Scotch kale, purple kale, cauliflowers, and several other types. Our friend had overlooked the fact that although he only had Brussels sprouts growing in his gardens, his neighbour had stray plants of other kinds, and that bees will fly long distances in search of food when the plants are widely scattered, and pollinate the flowers they visit.

DISEASED PARSNIPS. — Observer, Surrey: Your parsnips suffered during the growing season from Parsnip Mildew, which is caused by the fungus known as Peronospora nivea. The roots that have been so injured by the attack as not to be fit for consumption should be burnt, for the purpose of destroying the resting spores. If they are thrown on to a rubbish heap, and the material when decayed spread over the quarters previous to their being dug or trenched, it may be that soil free from the fungus will be infected. The peelings of such roots as are used should also be burnt, and not be thrown on the rubbish heap, or be used in pig feeding. A spraying with Bordeaux Mixture on the first evidence of mildew would probably be useful in preventing it spreading over the plants. As your soil is heavy a good dressing of lime to the quarters in which the parsnip crop is to be grown would be beneficial. The lime should be applied previous to the ground being dug, and it should be well mixed with the soil in the process of digging.

Presents for Christmas and the New Year. — It is generally conceded that no more welcome present could be made to a friend than a good book. Of good books there are many, and those devoted to gardening have special claims for consideration from those who contemplate making presents to their friends. With a view to assist onr readers in the making of a selection, we suggest that they obtain the catalogue of books for garden-lovers, issued by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C. The catalogue includes works on the flower garden, the greenhouse, vegetables, hardy perennials, carnations, chrysanthemums, window gardening, and many other subjects. Especially worthy of mention for its great value is the "Encyclopædia of Gardening," which should be in the hands of all who take an interest in gardening, whatever may be the trend of their taste. The catalogue, we would add, is sent post free.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Situations Wanted.

GARDENER (Head, where several are kept); thoroughly experienced in all branches, inside and out; grapes, peaches, melons, stove and greenhouse plants; four-and-a-half and eleven years' excellent references as head; married, family out. E. STONE, 13, Coniston Road, Addiscombe, Croydon, Surrey.

GARDENER (Head Working), requires SITUATION: experienced in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Garden, Hardy Fruit, etc.; good references; married, no family. W. S., 73, Allen Street, Maidstone, Kent.

GARDENER (Head Working, where two or more are kept); experienced in all branches; 12 years' excellent reference as Head; left own request; age 45; two in family, youngest 15. HUNT, 9a, Bridewell Street, Devizes, Wilts.

GARDENER (Head Working, where two or more are kept); good all round; can be well recommended; married when suited; age 36. PEARCE, 10, Roxwell Road, Shepherd's Bush.

GARDENER (Head Working); life good practical experience in all branches, Inside and Out, Early and Late Forcing; excellent references. H. TURNER, 62, Star Road, Peterborough.

GARDENER (Head); life's practical experience in all branches, Inside and Out, Grapes, Peaches, Melons, Stove and Greenhouse Plants, Malmaison and Tree Carnations, Orchids, Chrysanthemums, Landscape, and Rock Garden, Vegetables and Hard Fruits; nearly eight years as head of six; excellent references; age 35. F. SMITH, 4, Mellish Terrace, Morden, Surrey.

GARDENER (Head Working, where one or more are kept, or good Single-handed); experienced Inside and Out; good references; abstainer; married; age 29. W. S., Office of this Paper.

GARDENER (Head Working) requires SITUATION: experienced Vines, Peaches, Melons, Fruit, Flowers, Vegetables; 5 years' good character; married. C. N., Clarence Cottage, Broadbridge Heath, Horsham.

GENTLEMAN recommends GARDENER (Head of two or three); life experience in all branches; understands formation of new or renovating old gardens; married, one boy 10 years; age 45. PENNELLS, Phœnix Green, Winchfield, Hants.

GARDENER (Head Working); age 44; life experience; 21 years' excellent references from first-class establishments; thorough knowledge in all branches, leaving own request; no young children, youngest 14. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept: been here 5½ years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER Single-handed or otherwise; good all-round man in all branches, or handy man on gentleman's estate; good at either; willing to be useful, active and reliable; good character; age 45; married, one child. OSBORNE, 48, Bradshaw Road, Watford.

WORKING MANAGER or FOREMAN. Advertiser seeks engagement in Market Nursery or otherwise for either of the above; Bulbs and Root Forcing, Ferns and Chrysanthemums a speciality, also Cut Flowers in quantities (both Inside and Out), and Bedding Stuff; good Wreath, Cross, etc., Hand; over 20 years' practical experience in the general routine; highest references, age 35 years. T. J. COOK, 97, Llanover Road, Wembley, N.W.

FOREMAN or GROWER.—ADVERTISER (27) seeks SITUATION in Nursery; married; life experience Cucumbers, Tomatoes, Chrysanthemums, and general Pot Stuff. A. MARTIN and SONS, Blacknest Nurseries, Crowborough, Sussex.

BARTLE HALL NURSERIES CO., Longton, Preston, desire to recommend their FOREMAN (Working); entire charge or otherwise; Tomatoes, Cucumbers, Chrysanthemums, Mint, Forcing, large scale; total abstainer; competent manager of men; highest references. FOREMAN above.

C. W. CATT, Esq., will be pleased to recommend his SECOND GARDENER to any lady or gentleman; a thoroughly trustworthy and energetic Man, as Head Working Gardener, where 3 or 4 are kept; his credentials are of the highest order. Full particulars on application. Outwoods Gardens, Duffield, Derby.

SECOND GARDENER seeks SITUATION in good establishment where several are kept; well up in vines, peaches, melons, stove and greenhouse plants, including carnations and chrysanthemums; well recommended. Apply S. C. LOCK, Village Benenden, Cranbrook, Kent.

GARDENER (Under).—E. BATCHELOR, The Gardens, Woodlands, Addlestone, Surrey seeks SITUATION Outside or Inside good establishment, three years' references; left through death; age 21, abstainer; willing and obliging. Apply as above.

NOTE OF THE WEEK.

Records.

By records we do not intend to convey the idea of unprecedented achievements, a meaning to which the world of late years has improperly confined the word, but that due registration of discoveries and ascertained facts upon which the whole structure of our knowledge is based. Beyond all doubt, an immense amount of such possible building material has been lost in the shape of observations made and merely committed to memory, or, if recorded in such a shape as to be available to others as stepping stones to further research, have never reached the public owing to ignorance on the part of the observer's descendants, and consequent destruction as so much waste paper, or to their being so much in advance of their age as to be above the heads of their contemporaries, and consequently ignored. In the case of Mendel we have a salient instance of this, since though his wonderful paper was read to a local society at the time it was written it evoked no attention, went no farther, and was only, as it were, disinterred many decades later when De Vries came across it accidentally when following up the same line of research and seeking for any records which might assist him. In the case of Darwin, too, his epoch-making records ran, to a certain extent, a similar risk, since it was only when Wallace hit upon the same theory of natural selection as Darwin had been quietly working out for years, that the latter was induced by his scientific friends to put his records before the Linnean Society, and so to establish his priority; and it is a lasting proof of the nobility and modesty of both men that the two papers were read together on the one and the same memorable evening without a shadow of rivalry or self-seeking on either side, Wallace at once assigning pre-eminence and priority to his great co-discoverer. On studying Darwin's works, especially "Animals and Plants under Domestication," we cannot but feel what a pity it was that Mendel's theory did not come within his ken, since over and over again we feel how valuable a key it would have proved in his hands to many of the facts upon which in its absence he could only theorise, but could not fully bring into concordance with his main thesis. Had Mendel's paper figured in the Linnean records, doubtless the two great scientists would have come together, Darwin's work would have been extended, and the world would have been reaping the benefit of Mendel's labour as well for the past half century, instead of groping unprofitably in the dark for laws which have only recently been expounded and exploited on ever wider and more profitable lines. What a flood of light would Mendel's demonstrated facts have thrown on Darwin's "Hypothesis of Pangenesis," for instance, to say nothing of his general speculations on the phenomena of hybridity and reversion. Happily, in these days, there are far greater facilities for the registration of records, and their collection in such a form that the student or the professor who follows some special line of research has little or no difficulty in ascertaining what has been already done in that particular line, and thus avoiding the risk of taking infinite pains, to find out eventually that he has been forestalled. On the other hand, he is enabled to know whether he is really on the track of something new, and thus be stimulated to pursue his course with the greater application and energy. The moral of all this, however, is that it is in the power of every student of nature, the gardener and horticulturists specially included, to add his mite to the storehouse of knowledge if only he keeps his eyes open, observes carefully and systematically, and, above all, keeps records of all facts which strike him as out of the ordinary. Let him read such books as Darwin's "Movements and Habits of Climbing Plants," and "Insectivorous Plants" as examples showing how intelligent and continued observation of the phenomena presented may lead to an appreciation of the laws governing them. There in the simplest possible language, not in pedantic scientific jargon, he will find a mass of information touching upon plants with which he is already superficially familiar and whose peculiarities he can test for himself. Nature is inexhaustible, and it will be strange if, after such study and confirmation, he does not find within his ken some little line of investigation which he can follow up by himself, and possibly from such small beginning, be able to say at the end, "I have not lived in vain." To that end, however, careful records must be made, and nothing left to mere memory which will inevitably perish with him and benefit no one.

MR. W. HIGGS.

Mr. W. Higgs, whose comprehensive paper on the cultivation of incurved chrysanthemums for exhibition created so much interest at the recent conference held by the National Chrysanthemum Society, has long devoted special attention to this important section, and in the production of blooms for exhibition has achieved so high a degree of success as to occupy a position that might well be regarded as unique. That Mr. Higgs is fully acquainted with every detail essential to the production of incurved blooms in the highest state of development was evident in his paper, which we have had the satisfaction of publishing. He has afforded evidence upon this point in a still more conclusive manner by the large number of prizes he has been successful in winning at the more important of the chrysanthemum shows held in the United Kingdom. For a long series of years he was the winner of the Holmes' Memorial Cup offered by the National Chrysanthemum Society in the great class for forty-eight incurved blooms, and one knows not how long he would have continued to obtain this high distinction had he not resolved a year ago to retire from this important competition. Successful as Mr. Higgs has been in the cultivation and exhibition of incurved chrysanthemums, he has not by any means devoted his attention exclusively to them. On the contrary, he has proved a formidable competitor with the more showy Japanese varieties, and in 1905 he was successful in winning the Holmes' Memorial Cup for Japanese as well as for incurved, a feat not easy of accomplishment having regard to the keenness of the competition. On another occasion that we can call to mind he carried off, at an exhibition of the National Chrysanthemum Society, a valuable silver cup offered as the first prize in a class for twenty-four Japanese, in which there were twenty-two competitors. Mr. Higgs has been nineteen years head gardener at Fetcham Park, Leatherhead, the residence of J. B. Hankey, Esq., and during this period he has won first prizes at Hull, York, Batley, Bolton, Liverpool, Sheffield, Kingston, Bradford, Manchester, Bristol, Portsmouth, Winchester, and numerous other centres. The plate shown in the accompanying illustration includes two Holmes' Memorial Cups, two tea services, and cups won at Batley, Manchester, Liverpool, Kingston, and the National Shows. Although we have only referred to Mr. Higgs' work in connection with chrysanthemums, it must be said that his ability is not less marked in other of the departments of the extensive gardens under his charge.

Richmond Hill View.—When some years ago the Marble Hill estate at Twickenham was purchased by the local authorities for the purpose of preserving the view from Richmond Hill, a successful effort was made to place restrictions on building on certain adjacent riverside lands. The river frontage of Orleans House was included in the scheme, but a large portion of the estate was left in the market for possible building operations. It is therefore a source of satisfaction that the postponement of building operations for many years on a considerable area of the estate has been secured by the sale of the mansion and about half the land for the purposes of an important institution. Orleans House is one of the best known seats in the south-west of Greater London, and has a history extending over several centuries. In 1567 it was according to Lysons, let to Sir Thomas Newenham, and in the Parliamentary Survey of 1650 it was described as a "Pleasant and delightful tenement, about 20 poles from the river, built partly with timber and Flemish wall, with comely chambers; the gardens not only are for pleasure, but exceedingly profitable, being planted with cabbages, turnips, and carrots, and many other suchlike creatures."

Royal Horticultural Society's "Journal."—The second part of Volume XXXVI. of this publication has been issued, and contains much to interest those taking an active interest in horticultural matters. The contributions by the Rev. G. Henslow, F.L.S., V.M.H., on survivals among plants of the past, and the origin and history [illegible] vegetables, will appeal to scientists, while the paper by Mr. Praeger on the wild flowers of the West of Ireland will be of interest to botanists, and the papers on pansies and violas by Mr. W. Cuthbertson and Mr. J. Grieve; the building of rock gardens, by Mr. Clutton Brock; little-known grapes, by Mr. A. C. Smith; and the gardens of Athens, by Mr. D. S. Fish, are deserving of the attention of the general body of garden lovers.

Gloucester Rose Society.—We are pleased to learn that this society, which now devotes a large share of attention to sweet peas, as well as roses, has just completed a successful year. From the report presented to the annual meeting, over which Mr. Conway Jones presided, we learn that the year's work resulted in a balance on the right side and that the exhibition was highly successful. It was resolved to hold next year's show on Tuesday, July 4, and that an additional sum of £25 should be placed at the disposal of the schedule for the purpose of increasing the prizes for roses and sweet peas, with a view to attract both professional and amateur growers from a distance.

"**The Gardeners' Year Book for** 1911" is now published, and it will be found that, although the work has reached the fifty-third year of publication, it possesses the freshness and vigour characteristic of youth, and that additions have been made which render it even more useful than in past years. The established features have been maintained, with such revision as has been found necessary to bring them abreast of the advances that have been made in all departments of horticulture. The more important of the additions are the sections devoted to annual and biennial flowers and beautiful flowering shrubs. With these additions, the book becomes a complete encyclopædia of what to grow and how to grow the plants, flowers, fruits, and vegetables essential to large and small gardens. We shall take an early opportunity of referring to the "Gardening Year Book for 1911" more fully than is now possible, and in the meantime would add that it is published by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C., price 1s., post free 1s. 3d.

Market Growers and the Waverley Market.—The question of transferring the vegetable market from the Waverley Market to the site of the old gasworks in New Street, Edinburgh, has recently been raised at a meeting of the Edinburgh Town Council, and the growers around the city are greatly alarmed at the prospect of the transfer of the market. A largely attended meeting was held the other day to protest against the proposal, and in the course of the meeting Mr. David King of Gorebridge, who presided, declared that to shift the growers from the Waverley Market to the Gasworks site would ruin their business. Councillor Chesser somewhat allayed the fears of the growers by stating that he felt they were a little over-alarmed about the matter. Mr. Paton, the City Chamberlain, who was present stated, that the Waverley Market was very profitable to the City. During the past year it had earned a net profit of £2,500, and the bulk of that had come not from the market gardeners, but from others who had rented the market for concerts, etc. He expressed the hope that as in the past the growers would not place any unreasonable obstacle in the way of the profitable utilisation of the building.

Potato Crop in Great Britain.—A preliminary statement has been issued by the Board of Agriculture showing the acreage under potatoes in Great Britain in the current year, and the estimated total produce and yield per acre. The area in England was 376,834 acres, and the estimated produce 2,467,179 tons, or an average of 6.55 tons per acre. In Scotland the area was 136,837 acres, and the estimated produce 878,300 acres, or an average of 6.42 tons per acre; and in Wales the area was 26,013 acres, and the estimated produce 132,810 tons, or an average of 5.11 tons per acre. The total area for Great Britain was 539,684 acres, the estimated yield 3,478,289 tons, or an average of 6.45 tons per acre. These figures represent a material decrease in the area and estimated produce, and a slight increase in the average yield per acre.

Prizes for Platform Gardens.—The competition for the prizes offered by the Midland Railway Company for the most attractive gardens at the stations on its system was this year unusually severe, for the number of competitors was large and the gardens generally were of a high order of merit. The awards made during the past summer have been just confirmed by the Board of Directors, and the four gardens that obtained premier honours were those at Morecambe, Five Ways, Malvern Wells, and Alcester. Next in order of merit were those at Borrowash and Defford. A large number of other gardens received prizes of various grades. Altogether the awards amounted to £325.

Penarth Rose Society managed, in spite of very untoward weather on its show day in July last, to make its income balance expenditure, the sums on both sides of the balance-sheet being exactly £235 4s. 10d. The Earl of Plymouth is president for the ensuing year, and Mr. H. Gerhold will continue to act as secretary to this very enterprising society. The exhibition of 1911 will be held on July 5.

Proposed Osier Cultivation in Scotland.—Mr. G. G. Esslemont, of the Aberdeen and North of Scotland College of Agriculture, and Mr. William Dawson, of the forestry department of Aberdeen University, have been appointed to report on the cultivation of osiers in the crofting districts of Inverness-shire. The cultivation of osier beds is recognised as a profitable form of industry, which has passed largely into the hands of Continental growers. The various kinds of willow thrive in ground unsuited for any other kind of crop. In the Highlands of Scotland there is no reason why osiers should not be cultivated. They are to be found to a considerable extent in the Fens of Lincolnshire and in the North of Ireland, and they appear to pay the growers. There is a fairly large outlet for all kinds of willows for basket-making and other forms of manufacture, and that being so, there seems no reason why Scottish smallholders should not have a try. A committee of Highland gentlemen has been appointed to help in the work of Messrs. Esslemont and Dawson.

A Gardeners' Protection Association.—Rarely, we think have gardeners combined to form an association with the avowed purpose of guarding their interests and safeguarding "the gardeners of the district against the depredations which take place." Such an association is being formed at West Melton and Wath, and the members are chiefly residents in the district who are allotment holders. Officers and committee have been appointed, and a general meeting is to be held at Winterwell on December 3 for the purpose of adopting rules, etc.

Poisoning of Animals by Potatoes.—Two cases of poisoning of farm animals caused by raw potatoes are reported in the "Berliner Tierarztliche Wochenschrift," and these emphasise the importance of exercising care in feeding farm stock with considerable quantities of potatoes. In one case a herd of cattle developed symptoms of poisoning after being fed on a large quantity of raw tubers, and in the other two cows were taken ill after a meal of parings of potatoes, these also being uncooked. It is suggested that to avoid the risk of poisoning animals fed with potatoes, the tubers should previously be cooked. This, however, is not so sure a safeguard as is assumed by some writers, for on turning to the Journal of the Royal Agricultural Society for 1897, we find a case recorded of eleven horses dying within three days under exceptional circumstances, and the cause of death being traced to their having been placed on a diet of steamed potatoes. It was in this case established beyond doubt that the death of the animals was not due to mineral poison or infection, and it was thought probable that the poison was some organic substance generated by the bacteria or fungi which were growing in the decaying tubers.

Sale of Poisonous Insecticides.—The conditions under which insecticides of a poisonous nature can be sold by nurserymen and seedsmen are of a very unsatisfactory character, and greatly in need of improvement. We had a further proof of this in the appeal heard in the King's Bench Division by Mr. Justice Darling and Mr. Justice Bucknill, on the 14th inst. This was an appeal from the decision of the County Court Judge, sitting at Kingston. The Pharmaceutical Society brought an action against Mr. James Nash, Jun., of Wimbledon, to recover the sum of £5 as a penalty for selling poison contrary to the provisions of the Poisons and Pharmacy Act, 1908. In March last a person employed by the Pharmaceutical Society called at the shop in Wimbledon, where Mr. James Nash, Sen., carries on the business of nurseryman and florist, under the style of Messrs. James Nash and Sons. This person asked for, and was supplied with, a half-pint bottle of XL-All Insecticide, which contained nicotine, a poisonous vegetable alkaloid, within the schedule of the Pharmacy Act, 1908. He was served by Mr. James Nash, Jun., who is an assistant to his father, and was not licensed under the Act. Mr. Nash, Sen., who is licensed, was not in the shop at the time. Under section 15 of the Pharmacy Act, 1868, the society can sue by way of penalty any person other than a pharmaceutical chemist who sells poisons; but by the Poisons and Pharmacy Act, 1908, section 2, section 15, of the Pharmacy Act, 1868, is not to apply in the case of "poisonous substances to be used exclusively in agriculture or horticulture for the destruction of insects . . . if the person so selling is duly licensed for the purpose by a local authority." It was contended on behalf of Mr. Nash, Jun., when the case was heard before the County Court Judge, that as the assistant of a person duly licensed under the Act, he was entitled to sell the insecticide. The County Court Judge gave judgment for the society, and in the course thereof said that as Mr. Nash, Jun., was not licensed to sell poisons under the Act of 1908, he had become liable to the penalty claimed. The latter appealed, but at the hearing on the 14th inst. their Lordships affirmed the judgment.

Poisons and Pharmacy Act, 1908.—Since writing the paragraph immediately preceding, relating to the sale of poisonous insecticides, we have received the following letter from Mr. G. H. Richards, who, as is well-known, took an active part in the proceedings which resulted in the passing of the above Act: "On Wednesday, the 14th inst., a doubtful point in connection with the Poisons and Pharmacy Act was settled by the Judges in the Divisional Court. Their decision was as follows: Under the Act of 1868, only a qualified pharmacist could sell poisons, not an unqualified assistant; and it therefore followed that under the amended Act, 1908, only a person licensed by the local authorities could sell poisonous compounds for horticulture and agriculture. Managers and assistants were not entitled to sell unless they held a separate licence. It is to be hoped that nurserymen and seedsmen holding licences under this Act will now take special warning from this decision, and not allow their assistants to be trapped. I am sorry to say that only within the last ten days several agents have been threatened with penalties for not affixing their name and address on the bottles, but as the purchasers were strangers, they should not have been supplied." Mr. Richards informs us that the Traders in Poisons Society are now going to approach His Majesty's Privy Council, asking for greater facilities for obtaining licences, and at less expense, so that assistants can obtain licences to sell (under the head licensee) at a nominal charge.

DECORATIONS WITH EVERGREENS.

Festivities at Christmas are very tame without decorations of evergreens, which can be used in many forms, and in all they are effective if taste is shown in their use. Wreaths and festoons are perhaps the best ways in which to use them, and in pruning such kinds as bays, hollies, cupressus, buxus, euonymus, gaultherias, and ivy, the nice pieces should be saved for this purpose. Sprays of Cupressus sellaginoides are most useful, as are those of variegated holly. Also Skimmia Fortunei and S. japonica, especially in a season like the present, when holly berries are scarce. We have at Leonardslee some thousands of hollies, but those with a good supply of berries could be counted on the fingers of one hand. Therefore, sprays that can be spared without crippling the trees should be cut at once.

SOME OF THE TROPHIES WON BY MR. W. HIGGS
At the Exhibitions of the National and other Chrysanthemum Societies.

Wreaths may be made on wet afternoons, as with simple instructions the men and boys soon become adept in the work. In the first place the material should be cut up in nice and convenient pieces in order that the work may be proceeded with in an expeditious manner. Measure the length of the wreath required, and then allow sufficient rope or string for tying at either end. Make both ends fixtures, and start at one end, and lay all the pieces of evergreen and berries one way, and the same thickness throughout. These wreaths look very pretty if done neatly.

Large entrance or inner halls, present a pleasing appearance, with four of these fixed in the centre, and then gracefully looped up at the corners, one in each, where a large circular wreath should receive the end. A lamp may be suspended from the centre, and from this may depend a bunch of mistletoe, this being supported by thin silver wire. If there be pillars a small wreath should be entwined around them, with one or two small flags at intervals of three feet or so, or pink and coloured paper can be used effectively. Paper flowers are now made so well, and are so cheap, that they can be freely used with good effect. They are really better than real flowers if the latter are not placed in vases, which they should always be. Small tin vases can be easily made to order of various shapes and sizes for the different purposes and positions. Nothing is more unsatisfactory than to see flowers dead and dying in decorations. I have seen church decorations with the flowers dead before the service began. These vases can be made by any smith or tinman, and last a considerable time if after use they are dried and dipped in paraffin and kept in a convenient place.

Large palms are useful for placing in recesses, or for openings or arches, and well-developed examples can hardly be put in the wrong places. Stood on pedestals that are of good height they are always effective, with Asparagus Sprengeri and a few pots of lily of valley at the base. Long trails of ivy are always useful, and can be worked in with good effect.

W. A. Cook.

Browallia speciosa major.—This may be sometimes seen bedded out in the summer, while, given a winter temperature of 50 degrees to 65 degrees, it will flower continuously at that season. Like most of the other browallias, it is a native of the elevated regions of South America, and has now been grown in this country for some years. The flowers, which are freely borne, are a kind of bluish-purple colour. It can be easily raised from seeds or struck from cuttings as readily as a fuchsia, while it will thrive in any ordinary potting compost.—W. T.

JAPANESE CHRYSANTHEMUMS FOR EXHIBITION.

The following paper was read by Mr. Norman Davis at the Conference recently held by the National Chrysanthemum Society at Essex Hall.

Many kind friends often tell us that the exhibition chrysanthemum blooms are already too large, and they do not want to see them develop any farther; but I hold, that all other qualities being equal, no flower, whatever it may be, chrysanthemum, rose, or anything else, can be cultivated to too large a size. Development is the soul of the gardener's work, and nothing can, or should, stay it. It is for us, however, both individually and as a society, to maintain a high standard of development, so that each step forward is only complete when all qualities are perfected, not only in the blossom, but the habit and vigour of the plant that bears it.

I think that sometimes our judges, both at our exhibitions and on the Floral Committee, do not give the fullest consideration to all the points required to maintain the highest standard of perfection. When, about nineteen years ago, some of the leading spirits of the society secured for us those handsome Holmes' Challenge Cups which have ever since been such a source of interest at our shows, it was thought by some of us that any new class in connection with these cups should be formed with the object of bringing out more variety of colour and form than was possible under the restricted conditions of the competitions then prevailing. Our largest class for Japanese was one for twenty-four blooms, and those in eighteen varieties only. Not without considerable opposition a class for forty-eight distinct varieties in the Japanese section was instituted, and although it was a big jump from eighteen to forty-eight, the class was an immediate success, and gave great impetus to exhibitors and raisers alike, by reason of the greater variety that could be shown. Now, however, with the large number of raisers we have, there is almost unlimited choice, with the result that size once again largely dominates our exhibits, to the exclusion of many beautiful forms and colours.

Successful exhibiting is the result of good all-round cultivation, and looking after little points that mean so much in the end; although, on the other hand, we are sometimes unnecessarily elaborate in our details. In the choice of cuttings, I am not so much concerned about the size of them as I am about the stock from whence they are taken. When we consider that the life of an exhibition variety is but a few years, and it is often two or three years before we see it at its best, I think there is material advantage in selecting our cuttings from those plants only that give perfect blooms, which, at the same time, will probably be the healthiest plants. If this was done systematically I think varieties would keep up their vigour for a much longer period. And in this direction also, I think resting the stock now and then for a season must help to keep up the quality of the flower. By resting I do not mean a process of starvation; that is, propagating from some low grade stock year after year which has never known the influence of cultivation, but I mean just providing an extra plant or two from your own cultivated stock, and giving natural treatment in the open ground for a season.

It may be well at this point to call your attention to what, in my mind, is the most important factor in cultivating these plants, namely to ensure perfect maturity, without which it is impossible to build up huge blooms. In this matter we have to consider how far we can create a luxuriant growth and yet mature it in proper time, so that when the period of bud formation comes round the plants are ready to go on with the function of flower building. Now, before we proceed farther, let us study the general growing principles governing this process of flower building, that is, transforming those thin flowers natural to the terminal growths into those immense blooms you wish to secure. In the first place, we have to create the plant, and then mature it; and it is on this little word "mature" that the whole of our ultimate success depends. The function of the plant's life is two-fold: (1) To build up its stems and branches; and (2) to develop its flowers; and it can only perform to the full this second function, after it has completed the first. Maturity does not altogether mean the ripening of the growth, but rather the completion of its active root growth, for when that has been secured the ripening process naturally follows. Thus, in the treatment of our plants, we have to consider all the points in relation one with another. At the commencement you determine which bud you wish to secure, and the date you expect it to form, and in relation thereto you must ensure that the plant is then ready to go on with its development.

If the plant has to complete a considerable amount of root action it is not in a condition for you to stop its growth for the purpose of securing your buds, for growth and root action should be equal. To secure this is a matter of root restriction, that is, size of pot used. According to the bud you take, so must you regulate your pots. In dealing with different varieties, however, you often find that one variety will make more root action in six months than another will in nine, so that it will not be inconsistent in sometimes we use a larger pot for a "first crown," than in some other cases we use for a "second crown," or even for a "terminal growth." Here we find the skill of the grower. He knows, to some extent, he can create a luxuriant growth, and yet have it matured in time for bud selection. To over-feed or over-pot frustrates our intentions, and failure more or less is bound to ensue.

It is well known that the doubling of flowers is mainly caused by restricted root action, and it is only this principle we apply to our chrysanthemums. Botanists tell us that "florets" are but the modification of foliar leaves, and this might be difficult to understand but for the facts before us. We have a variety giving us on its terminal growth a thin flower of some fifty to a hundred florets; we curtail a part of its growth by stopping at the second crown, and we then have a flower of, say, seven or eight hundred florets; or we curtail still further and stop at the first crown, and we obtain a flower with perhaps twelve to fifteen hundred florets. Thus we have the principle of flower building, but, of course, this is only an illustration. It may be that a variety is naturally double on its complete growth, and it would be folly in such a case to curtail so much as to attempt to develop a crown bud, which, if it opened at all, would be a mass of short florets without shape or form; and thus we get the principle of bud selection.

As I have to deal mainly with this one particular section, viz., the Japanese, there will be no need for me to do more than glance at the general details of cultivation. Our first thought is naturally soil, and I think we treat this too much from the point of view of its being simply a medium for feeding the plant, whereas the first use of the soil is to hold fast the plant. With a light soil, however rich in plant food, we cannot expect a steady, even growth. Such a soil requires an undue quantity of water, as it has no holding power, therefore a good stiff holding soil is essential, independent of its feeding properties. Providing it is rendered thoroughly porous, the nearer to clay a soil is the better chrysanthemums like it. Many growers are far too elaborate in the matter of drainage, in my mind, greatly to the detriment of the plant. Of what earthly use some 2in. of crocks are is a puzzle. I never use more than four pieces of crock to the largest sized pot, and in the early stages nothing beyond a piece of dry manure. There is then no breaking of roots to get the crocks away. I think that the bottom of the pot is just where the plant seeks nourishment. If instead of using a lot of fine silver sand you kept the soil open with ordinary ashes from the ashbin or stokehole, you would have little trouble about drainage; I use nothing else except what I put in as food, and I rarely have a pot clogged for want of drainage.

As already intimated, size of pots should be according to what the plants are called upon to do. Very few crown bud varieties require any larger than a 10in. one, in fact, the majority only 9in. Generally, plants should have three shifts from the thumb pots, or two from the 60's or 3in., but there are many of the stronger growers on which we are able to secure later buds, and if we get them well on in the earlier stages, they will very well take a fourth shift. If this can be given with certainty of perfect maturity, you will increase the size of your bloom considerably. Under this treatment, however, where you would have used a 10in. pot for a final, you use only an 8½in. or 9in.; and for the extra shift an 11in. or 12in. This extra shift, when for a second crown bud secured late in August, need not be given till late in June. This is a far better plan than the method of top-dressing—a practice I have little faith in.

FEEDING.

Japanese varieties will take more food, generally, than any other section, being of a grosser growth. We feed moderately in the early stage, increasing it during active growth, and gradually reduce again after the main growth is completed. To get full advantage of the food we give, the soil should be in proper condition, and of the right texture as already explained. These are the points:—We divide our nourishment. Some we put into the soil, and we complete the process of feeding in the form of liquids. For mixing with the soil I recommend to each barrowload (three bushels) of soil: bone-flour, 1 quart; burnt refuse, about 1 gallon; Peruvian guano, ½lb.; soot, 1 quart. The guano best for our purpose is a low grade, having only a moderate amount of nitrogen, but rich in phosphates and various salts. In potting, except for the very small stage, I do not see why the soil should not be of the same texture, and supplied with the same food all through. Many who write upon this subject seem to think that it is only for the final potting that properly prepared soil is required, for it is only at this stage that they give details for composts. But we want to get luxuriance into our plants from the commencement. For later feeding proceed in the same way: a little in the early stage, increasing as growth goes on. I am reluctant to recommend any particular compounds, of which there are many excellent preparations on the market, especially as I rarely use any preparations of which I do not know the complete nature. Personally, I have used for many years little else than Peruvian guano. It is rich in all those elements needed for hard and mature growth, and we can use it with so much more confidence than highly concentrated preparations, that I have always great confidence in recommending it to others.

In giving liquid manure we must take into consideration the fact of what we have already put into the soil, so that after each potting it is best to stay liquid food for a week or so. Guano, as a general food, should be used at the rate of one ounce to the gallon for the earlier stages, increasing it to two ounces when in the 5in. or 6in. pots and in the finals, till bud formation, then reduce again to one ounce, which continue to the finish. This, however, is not a complete course of food, as during active growth, that is, after the small stage until we stop growth, the plants require a larger supply of nitrogen than we find in the guano. This can very well be supplied by the liquid from fresh horse droppings and soot, either given separately or the guano added to it. In the latter case the guano is given in less quantity. Failing this, sulphate of ammonia or nitrate of soda at the rate of a half-ounce to the gallon given once, to two applications of guano, one or the other twice a week. After the blooms show colour discontinue the stimulants, only giving the guano, except for an occasional dose of those special chemicals referred to when treating upon colour.

(To be continued.)

HOME-GROWN BANANAS.

It has often been a matter of surprise to me that the handsome Musa Cavendishi is so seldom seen in gardens in which there would be no great difficulty in providing the accommodation necessary for its successful cultivation. As so well known, it is comparatively dwarf in growth, so that a very lofty structure is not necessary; its leaves attain a large size and give a tropical appearance to the structure; and the fruits, which are borne in huge clusters, one on each plant, are, when they have attained full maturity, simply delicious. Home-grown bananas are very different to those from the Canaries and the West Indies, and procurable at the fruiterers, although these are a boon to those who have no conveniences for the cultivation of the Musa, more particularly to town dwellers, who have to purchase the whole of the fruits they require. A cluster of well-ripened home-grown bananas is always an acceptable addition to the dessert, and in consequence of the many ways they can be used in the culinary art, they are eagerly sought after by the cook.

The culture of Musa Cavendishi is really quite simple. A commencement is made by obtaining strong suckers, which should be put in fairly large pots, a compost, consisting of loam, well-rotted manure, bone-meal, and lime rubble being used. When rooted the suckers should be transferred to a bed made up in a roomy house in which a stove temperature can be readily maintained. This bed should range from fifteen to eighteen inches deep, and should rest upon a good depth of drainage materials, and these must be connected with a drain to carry the water that passes through them out of the house. An efficient drainage system is essential, because during the heat of summer large quantities of water are required, and were provision not made for carrying off the surplus moisture the soil would become sour. The bed should be formed with good fibrous loam, with a sprinkling of bone-meal and lime rubble.

The planting should be done in July or August, as when the plants are put out during those two months they will develop fruit during the following summer. This is a point of importance, because, according to my experience, the bunches developing during the winter months are not so good as those attaining development during the summer. This difference is not surprising considering the great difference in the amount of light and solar heat in the two seasons. In a few weeks after planting they begin to grow away freely, and require plenty of heat and a liberal degree of moisture, both in the atmosphere and at the roots. A good soaking of liquid manure once a week is also highly beneficial. Use the syringe freely during bright weather, taking care not to damage the leaves, which are very brittle. As a matter of course, the syringing must be done at such times as to avoid the risk of the leaves being injured by the rays of the sun when wet.

The suckers that will spring up around the base of the plants must have attention, and the best course is to remove all that appear until the fruit is well developed, when the best placed one to each plant should be selected to take the place of the fruiting stem when it has brought its fruit to perfection and is cut away. The suckers not required will be removed. During the summer months screen the leaves from the direct rays of the sun, but avoid a dense shade, as that has a tendency to weaken the foliage and make it flabby. When fully developed cut the bunch and suspend it in a dry fruit room to ripen, and use the fruits as they ripen. The bunch of which I send you a photograph, is one that has been produced in the gardens here [Dunorlans, Tunbridge Wells] during the past summer, and was cut a short time since.

When the bunch is removed the stem is cut away, and a little of the soil is taken from the surface of the bed, and replaced with a compost prepared as advised for making the bed. After a few years it is advisable to clear away the old bed and replace it with wholly new material, and new plants. With so much water the soil soon becomes sour, and when that happens the growth is not satisfactory. Musa Cavendishi is liable to the attacks of thrips and scale, but by carefully syringing at intervals with an approved insecticide these pests are easily kept in check.

E. H. Caterer.

A FINELY DEVELOPED BUNCH OF BANANAS.

Gladiolus Baron Joseph Hulot.—There are now a great many varieties of gladiolus with flowers of a more or less bluish shade. One of the oldest, and at the same time still one of the most striking, is Baron Joseph Hulot. It is not a strong grower, but is for all that of good constitution. Belonging as it does to the Lemoinei race, even comparatively small bulbs will produce a good spike of blossoms. The colour is a kind of rich bluish-purple, so distinct from most outdoor flowers.—W. T.

CHRISTMAS FRUITS.

As we look into the fruiterers' and greengrocers' shops at the present time, we cannot but be struck by the small proportion of English fruits exhibited for sale, and at the high prices asked for the various kinds. As an example, for good cooking apples of the Bismarck, Bramley's Seedling, Wellington, and Blenheim Orange varieties, 7s. per bushel is being asked. I heard the other day of a sample of Lane's Prince Albert being sold for 20s. per bushel, and for a good sample of Cox's Orange Pippin 27s. per bushel was obtained, the same prices being offered for a further supply up to Christmas.

When bread, potatoes, and apples are fairly plentiful and cheap, the labouring classes can generally manage to pull through the winter pretty comfortably. What more appetising dish can be set before a family of hungry children than a good big apple pudding, or well-made baked apple dumplings. I have frequently seen a farm labourer sitting on a hedge bank with a hunch of bread and cheese for his dinner, washed down with a little cold tea, but what a difference to the enjoyment of the meal will be made if the bread and cheese can be followed by a capitally baked apple dumpling! But no such luxury awaits the labouring man this Christmas with apples at 4d., 5d., and 6d. per pound.

Pears are usually a delicacy at Christmas, but this year English fruits are most difficult to obtain. I know of an instance where fruits from a wall tree were sold for 6s. per doz. in the green state, as they hung. French pears are being sold at 6s. per case of twenty-four. Nova Scotia varieties of apples are fetching in the market from 15s. to 23s. per barrel of 126 lbs., and Canadian Blenheims are as high as 21s. to 25s. per barrel.

English grapes are priced at 1s. per pound for Colmars to 4s. per pound for Muscats, and 6s. per pound is being given for extra good bunches. That popular Christmas grape, the Almeria, is about double its usual price, from 20s. to 25s. per barrel of 60 lbs. being asked wholesale. Oranges promise to be fairly cheap; Denias and Valencias are quoted at 10s. 6d. to 15s. 6d. per case of 420, and up to 24s. per case for extra large varieties; Malagas, Jamaicas, and Jaffas are priced at 10s. to 12s. per case, but up to the present time all these fruits lack an attractive colour. Malaga lemons are priced at 40s. per case of 420.

All kinds of nuts are exceptionally dear; Brazils are quoted up to 60s. per cwt.; chestnuts, 18s. per bag of about 1½ cwt.; cobnuts, 1s. to 1s. 6d. per lb.; walnuts (Grenobles), 9s. per bag of 16 lbs.; and Barcelonas are 34s. per bag of 1¼ cwt. English tomatoes are gradually becoming scarcer, and the quality is decreasing, but tomatoes from the Canary Islands are plentiful, and the quality shows an improvement.

PERPETUAL CARNATION R. F. FELTON.
Flowers rose-pink. F.C.C., December 13, Perpetual Carnation Society.
Mr. H. Burnett.—(See New Plants.)

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PROTECTION FOR ROSES.

As winter weather approaches the annual question respecting the need of, and methods for, protecting our roses crops up. I know of some cases where, a few years ago, the roses were wrapped up in straw and bracken until the heads of standards were almost as well packed as if the plants had to be despatched on a journey. Mats were placed over climbers, on walls and fences.

As experience comes we find such over-protection almost as bad as none at all, because the wood is induced to make premature growth, unless the weather continues severe. Much depends upon the variety, and we now have little need to grow those of extra tender constitutions with the excellent selection of almost any desired colours available. Not only have the teas and noisettes proved considerably more hardy than was imagined a quarter of a century back, but we have now a race of hybrids from the more hardy perpetuals that all assists in the direction of frost resistance.

Position and district also need consideration. What will be needed in the North, or exposed places in the Midlands, can often be dispensed with elsewhere. One cannot give any definite guide, and I know of many who never protect roses in the slightest degree. It is the happy mean that should be aimed at here, taking into consideration the variety, district, and aspect. To my mind, very little protection is necessary in the majority of cases.

Then as to the material used. Bracken, strawy litter, and other substances, easily drifted by wind, are almost useless, because a steady, or what I may perhaps be allowed to style a quiet frost, does very little harm. The worst is a keen frost-laden wind, and in this latter case the dry litter would certainly be blown off from the wood we wished to protect, and so lose its efficacy. Another objection to such material is that rain or snow can so press it around the roots or base of the plants, that a wet mass is the only result, and, I take it, few will dispute that wet and frost combined are doubly harmful. It is for this reason I do not favour the use of well-rotted manure as a winter dressing too near the base of the plants.

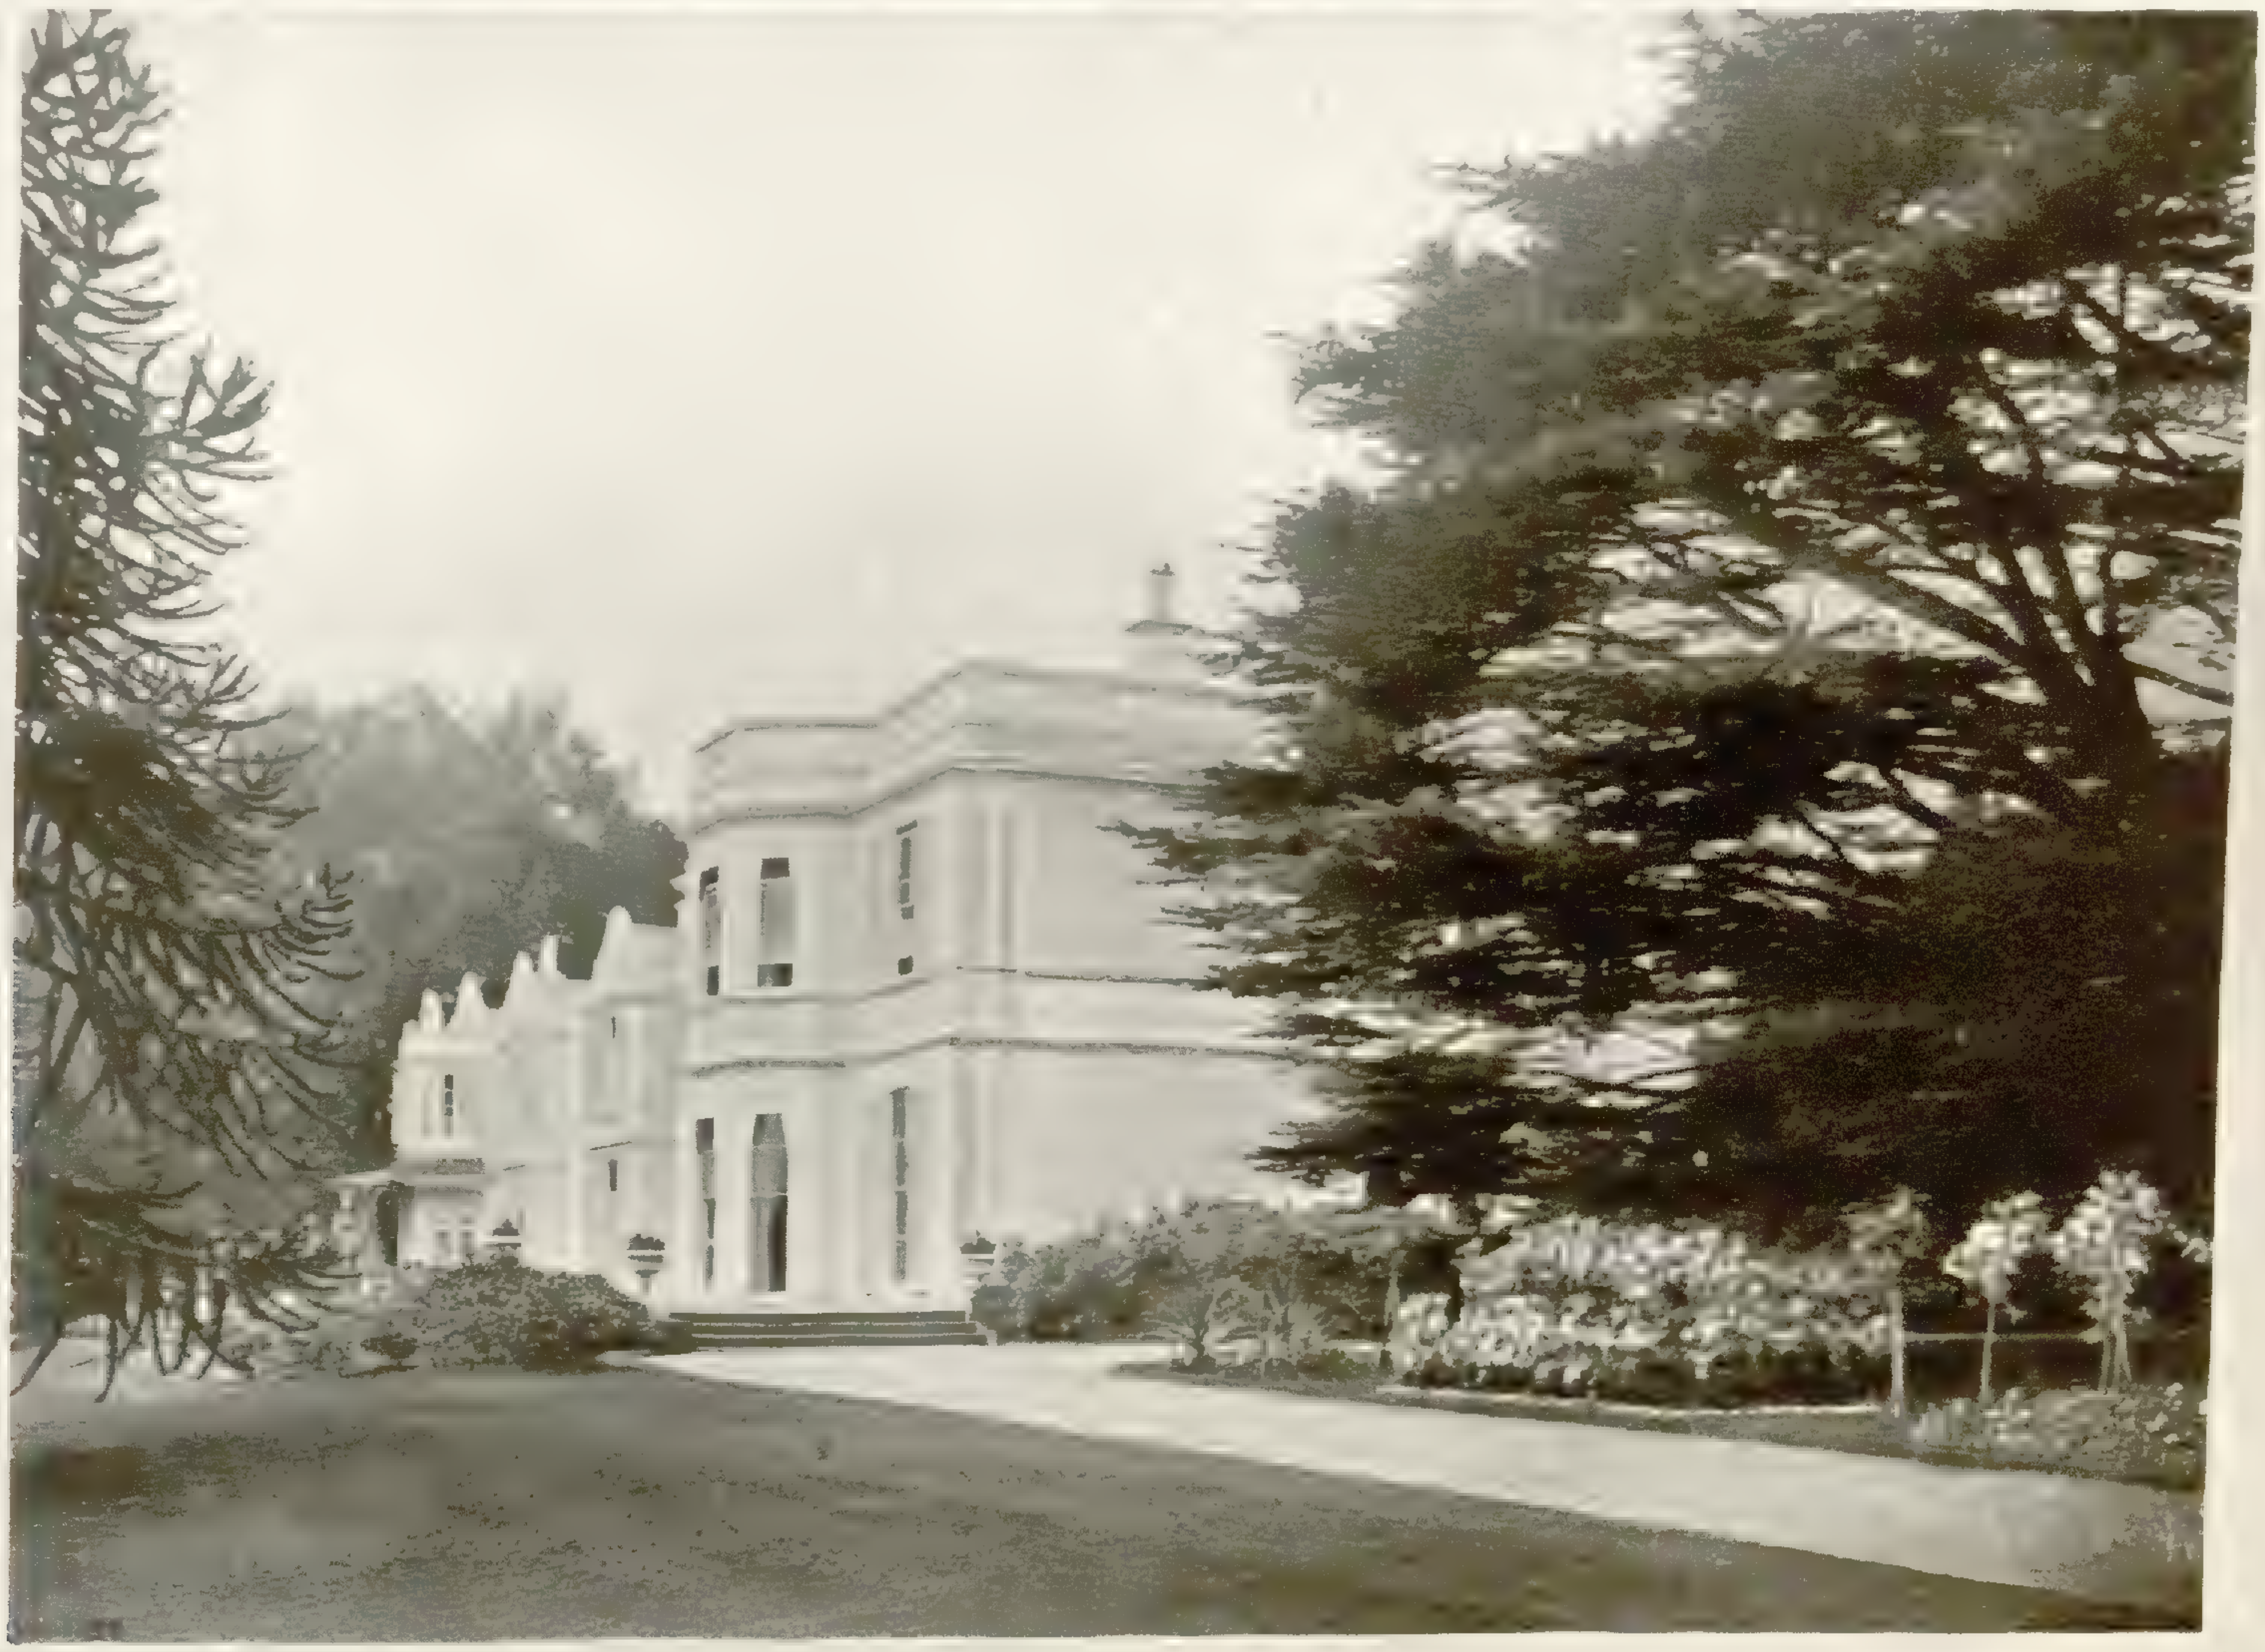
My own choice would be boughs of birch, spruce, or other firs, anything that will break the wind. These may be stuck into the ground, and will not blow away into odd corners at the very time their protection is most needed. They are easily fixed upon the windy side, and as readily removed, while they do not hold water or have the messy untidy appearance of litter or bracken. They can be kept in readiness and used when wanted. In the case of standards, none but the hardiest should be grown in this form unless a sheltered position is accorded them. Bracken among and around the heads is the only thing to be seen here, but it must be tied up securely to be of service. Not much is needed, and being kept from contact with the ground it will be dry during frosty periods.

There is no doubt the best plan for dwarfs is to draw up a fair amount of the surrounding soils to the base of the plants. This, at any rate, protects in the most effectual manner all bottom eyes, and also has the great advantage of keeping them drier. I do not mean to decry all mulching, but to warn against moisture-retaining material being in touch with the base of the plants, which, I feel certain, does more harm than good.

A. Piper.

WARREN HOUSE, STANMORE

Right away up the hill from the little one-platformed station of Stanmore, in Middlesex, and about a mile and a quarter from it, stands Warren House, the residence of Mrs. Bischoffsheim. The gardens are extensive, beautiful, and diversified, and set in a well-wooded estate of about three hundred acres. Being at a considerable elevation, the house and gardens command extensive views over extremely pretty country, with the whole of the western side of London in the distance, ranging from the Alexandra Palace in the north to the White City in the south. From such a position as this, the mighty Metropolis, softened into beauty by distance, becomes a splendid background for many miles of charming scenery.



[Photo: H. N. King.

WARREN HOUSE—GARDEN FRONT.

The trees and shrubs form one of the outstanding features of interest in the gardens of Warren House. A grand old Cedar of Lebanon occupies a commanding position quite close to the mansion, while a magnificent Golden Queen holly, the largest I have ever seen, has a fine Araucaria imbricata as near companion. On the outskirts of the pleasure grounds there are numerous tall and clean-stemmed Scots firs that make an admirable framework for the picture composed of masses of rhododendrons, azaleas, lilacs, and roses so effectively grouped around the widespread lawns.

French and Dutch Gardens.

To the northward of the mansion, and extending for some distance in a line with the garden front, is a broad gravel pathway, and on the inner side is an equally long and straight border or bed, about four feet wide. In the summer this is gay with begonias, while for a spring display it is filled with forget-me-nots, margined with yellow pyrethrum. Down the centre of this long bed are low, close-headed standard box trees. But this bed or border serves chiefly as a setting for the French garden that extends right along to and under the old cedar. The design of this garden is difficult to describe. It is formal, of course, but in each section the beds start from one of two points, and their flowing curves extend over a considerable area. All the beds are outlined with narrow box edging, set in bright clean gravel, and filled with broken charcoal of a distinctly blue colour.

Mrs. Bischoffsheim's able gardener, Mr. McIntyre, who has had an unusually wide experience of landscape gardening and garden design, is chiefly responsible for this French garden, and it embodies some features seen in Continental gardens he has visited. Such a garden gives some colour even in the dark dreary days of winter, while its extension under the widespread limbs of the giant cedar, where plants will not grow, is a distinctly novel idea.

Farther from the house the Dutch garden yields another surprise, as it is screened from general view by trees and an undulating hedge of Portugal laurel on the one side, and by a range of glass-houses on the other. Box, yew, and holly, green and golden, are the subjects used in this extensive display of topiary work. With the exception of a few quaint figures, the shrubs are clipped into strict geometrical designs, and all are set in and surrounded by a closely cut lawn. Between the Dutch garden and the neighbouring range of glass-houses is a splendid wide border of roses. Here, within a neat edging of box the Queen of Flowers makes a grand display in great variety all through the summer and autumn.

Herbaceous and Water Gardens.

The grouping of certain classes of plants or the arrangement of various styles of gardening in certain parts of the garden, so that each feature is more or less complete in itself, are now very frequently practised in the design of new gardens or the remodelling of old ones. There is very much to be said for this method, especially in gardens of considerable size where each section may have ample room and yet not detract one whit from the restfulness and beauty to which a garden as a whole owes its greatest charm. At Warren House the several notable features are cleverly arranged; each seems to have had just the right position assigned it so that no one intrudes in the smallest degree on another. Although wide undulating borders of herbaceous plants are being planted near the pavilion at the commencement of the fine golf course in the park, the herbaceous garden proper is not right out in the open, as in so many instances. It is a broad, sheltered spot bounded by low hedges of yew. Two wide borders are separated from each other by a broad grass walk. Here the flowers may be inspected in comfort. Good old-fashioned flowers are mostly employed in this garden, and right well they thrive.

Near the herbaceous garden is a long formal pool, in which the choicer water lilies and other aquatics are planted. This is margined with moisture-loving subjects, notably irises in variety, and the whole presents a pleasing and effective picture in the summer season.

The Roses and the Vistas.

In a comfortable spot, sheltered, but not overshadowed by trees, and where it can be well overlooked from the terrace walk, is the rose garden. An enormous number of rose trees have gone to the proper furnishing of this garden. It is a large rose garden, with the geometrical beds cut out of the turf. There are pavilions and pillars covered with the finest of rambling varieties.

while standards and dwarfs of the best of the H.P. and H.T. varieties fill the beds among and around these prominent features. I should like to have seen this rose garden when at its full summer beauty, for it must have been a wonderful and fragrant picture. Near the rose garden is a very light pergola or rose walk, with Crimson Rambler and Dorothy Perkins growing up the supports and along the chains in a way that shows their appreciation of the position they occupy, and gives evidence of their intention to clothe the pathway with flowers in a season or two. Towards the margin of the lawn in which the rose garden is set, a series of tall standards of Wichuraiana roses weeping standards—have been planted recently, and in due course they will add their quota of floral loveliness to this part of the garden.

FLOWER BEDS IN THE WARREN HOUSE GARDENS. [Photo: H. N. King.

When, nearly two years ago, Mr. McIntyre took charge of the Warren House gardens, the beautiful piece of woodland to the north-east somewhat troubled him. His early experience in forestry told him that the undergrowth should be cleared or thinned severely for the sake of the trees. As game was not preserved in the wood he soon obtained permission to effect a clearance. During the progress of this work he was struck with the stateliness of the many fine oak, beech, and lime trunks, and conceived the idea of cutting broad walks right into the heart of the wood from various points, so as to create interesting and charming vistas. After a good deal of thoughtful planning his project was placed before Mrs. Bischoffsheim, who, taking a keen personal interest in every part of her garden, at once entertained the idea, and entered heartily into its consummation. She obtained a fine statue of Diana the Huntress, and also four wonderful old curved stone seats, finely carved, and with these formed the objective in the centre of the wood, to which five vistas now lead.

Not more than half a dozen trees had to be removed, and now the beauty of the woodland is revealed to all who pass along these long, straight, hornbeam-hedged pathways, while from the central viewpoint the house and five distinct glimpses of the garden can be seen.

The Glass Houses.

As one of the leaders of society Mrs. Bischoffsheim entertains largely at Bute House, in South Audley Street, S.W., as well as at Warren House, and consequently there are great demands upon the gardens for fruits, flowers, vegetables and plants. This means the upkeep of extensive fruit and kitchen gardens, but, unfortunately, the outdoor fruit crops at Warren House have been almost a total failure this year.

The glass department is a very large one, consisting of about forty fruit and plant houses. There is an orchard house about eighty yards long devoted chiefly to cordon pears, plums, sweet cherries, and dessert gooseberries, trained to cross trellises. Two houses are filled with cattleyas and lælias, species and hybrids, and there are numerous young seedling orchids in which Mrs. Bischoffsheim is taking a close interest. Two houses are occupied by odontoglossums and the cooler oncidiums, one shelters a batch of the glorious Disa grandiflora—an orchid that is probably managed better and in larger numbers at Warren House than in any other garden in the kingdom. A new house is set apart for the blue-flowered Vanda cærulea, there are three houses of tree and Malmaison carnations, nine vineries, many peach and fig houses, and stoves and forcing pits, and a very big, massively built winter garden furnished with araucarias, palms, bamboos, dracænas, and other elegant foliage plants, and providing an admirable place for afternoon tea at any season of the year.

A high standard of excellence is maintained throughout the establishment, and skilful culture, with its attendant handmaidens, order and scrupulous cleanliness, are evident everywhere. In the model farm, with its herd of pretty Alderney cattle, and in the various workshops, the same businesslike procedure is seen. But Mr. McIntyre is not quite satisfied that high-water mark has yet been reached, though he believes it can be attained when the various alterations in hand are completed, and when he and his staff of between forty and fifty hands will be able to devote still more attention to those minor details that put the finishing touch upon good gardening. For the present, however, both employer and employed may be justifiably proud of the Warren House gardens and the position they occupy in the horticultural world.

Charles H. Curtis.

Hippeastrum aulicum. — We generally look upon the spring months as the flowering period of the hippeastrums, which, as far as most of the garden forms are concerned, is quite correct, but this species blooms, as a rule, during the autumn and early winter. The flowers are of a deep red, veined with crimson, and shaded in the centre with green. The segments are unusually pointed, and are not, as in the better forms of hippeastrum, equidistant from each other, the upper and lower ones being divided by a considerable space. It is a native of Rio de Janeiro, and has been long in cultivation. Some individuals are, from a decorative standpoint, much superior to others. Owing to the irregularly shaped flower and pointed segments, Hippeastrum aulicum has been but little employed by the hybridist in the production of new varieties. —W. T.

USEFUL AND SHOWY BARBERRIES.

(Concluded from page 993.)

B. aquifolium.

This is, perhaps, better known to some people by its synonym of Mahonia aquifolium. Its pinnate evergreen leaves and terminal racemes of yellow flowers, which appear in March, are well known to garden lovers, for the species is one of those good natured shrubs which thrive almost anywhere where a plant may be expected to grow. A native of Western North America, it has been in cultivation for about 90 years, and several well-marked varieties have developed from it. Under ordinary circumstances it grows 3 to 4 feet high, though it may attain double the height, and form a bush 12 feet or more across. A peculiarity of the plant is that during winter some of the leaves take on rich hues; bronze, red, and scarlet all being represented. Good varieties are fascicularis, Murrayana, undulata, and macrophylla. In America the dried fruits are known as Oregon grapes.

B. aristata.

This is a deciduous species from the Himalayas. It is of strong habit, and forms a bush 12 to 16 feet high, and as far across. Where plenty of room is available it forms a handsome lawn specimen, whilst it is an excellent subject to plant in the back of a shrubbery where an unsightly object has to be blocked out. The flowers are pale yellow, and are succeeded by bunches of conspicuous purplish fruits which are coated with a glaucous bloom.

B. buxifolia.

A sub-evergreen species from Chili and of upright habit, this is clothed with dark green box-like leaves, and bears during April and May rich orange-coloured flowers from the leaf axils. Mature plants are from 6 to 8 feet high, but it may be kept dwarfer by pruning. A dwarf variety called nana may also be obtained.

B. japonica.

This native of China and Japan is an evergreen of commanding appearance when well grown. It must, however, be planted in a permanent position whilst quite small, for it is very impatient of root disturbance. Its principal asset is its large pinnate leaves, which are composed of about nine large thick leaflets, and are up to 15 inches in length. The yellow flowers are borne in terminal inflorescences in March, and are followed by blue-black berries. It grows 5 or 6 feet high.

B. Thunbergi.

This Japanese deciduous species has three periods during which it is very attractive. In April and May its pale yellow flowers are pretty; later on scarlet fruit forms an attraction; whilst in autumn the leaves colour brilliantly before they fall. Growing 3 to 4 feet in height, it forms a dense bush, and is a suitable plant for the front of a shrubbery.

B. vulgaris.

The common Barberry of our hedgerows must not be passed by without notice, for its racemes of coral-red fruits in autumn are unsurpassed in beauty by those of any other ornamental fruited shrub. It may be grown almost anywhere, and is excellent for places where a strong, vigorous bush is required, for its intensely spiny stems are proof against attacks by man and beast. Flowers are borne in May, and the fruits ripen during August and September. There are varieties in quantity, but few are worth growing. One with purple leaves serves as a subject for beds of coloured foliage shrubs, whilst the white-fruited form is somewhat of a rarity.

W. Dallimore.

MISTLETOE.

The common Mistletoe (Viscus album) is so popular at this period of the year that Christmas festivities can scarcely be carried on aright if it is missing from the decorations of the home. This popularity is doubtless due, in a large degree, to the many legendary traditions which centre round the plant, for from a mere decorative standpoint there are many shrubs which have more to commend them. Its use is probably a relic of pagan times, and from being a plant round which all sorts of superstitions gathered, it has gradually relinquished its claim of being able to protect the wearer from all kinds of evils, to assume a character of purely sentimental significance.

There is an old Scandinavian legend associated with the mistletoe from which its present use as a "kissing bush," in house parties may have been derived. This may be found in "Folkhard's Plant Lore," and runs somewhat as follows: "Baldr (the Apollo of the North) was rendered by his mother Frîgg, proof against all injury by the four elements, fire, air, earth, and water. Loki, the evil spirit, however, being at enmity with him, fashioned an arrow out of mistletoe (which proceeded from neither of the elements), placed it in the hands of Hödr, the blind deity, who launched the fatal dart at Baldr, and struck him to the earth. The gods decided to restore Baldr to life, and, as a reparation for his injury, the mistletoe was dedicated to his mother Frîgg; whilst to prevent it being again used adversely to her, the plant was placed under her sole control so long as it did not touch the earth, the empire of Loki. On this account it has always been customary to suspend the mistletoe from ceilings; and so whenever persons of opposite sexes pass under it, they give one another the kiss of peace and love in the full assurance that this plant is no longer an instrument of mischief."

Though it is of a parasitic character, an old West Country legend informs us that this has not always been the case, but that at one time it was a goodly forest tree. The wood, it is stated, was used to form the cross on which the Saviour was crucified, consequently the tree was condemned for evermore to flourish only as a bush, and that at the expense of some other tree.

That it is not fastidious regarding its host is very evident, for, though it is most frequently found on the apple, it is quite at home on lime, poplar, willow, and other trees. It sometimes occurs on the oak, but less frequently than on several other trees. This comparative scarcity on the oak may have been the reason for the Druids holding mistletoe grown on the tree in high esteem. From old books we learn that when mistletoe was found growing on oak the Druids repaired to the tree, clad in white garments, taking with them two white bulls, a golden pruning-hook, and a sheet. The high priest ascended the tree and cut the mistletoe with the golden hook. It was caught in the sheet held below, for if it was allowed to touch the earth its virtue departed. The bulls were then sacrificed, and, after the feasting was over the mistletoe was divided amongst the people, whom it protected from witchcraft and various other ills as long as it was worn. Though it might naturally be supposed to have been an enemy of witches, yet it entered into their pharmacopœia, and we are told that witches used the berries with those of the holly, yew, and the acorns of the oak to prepare a chain which, if put under the pillow of a maiden, who must go to bed before twelve at night, would reveal to her much that she was desirous of knowing relative to her sweetheart and the result of her love affairs. Another way of obtaining an insight into a person's future was to gather fresh mistletoe berries, not exceeding nine in number, these were to be steeped in a liquid composed of equal proportions of wine, beer, vinegar, and honey, and taken as pills without having food before going to bed. The person was advised to go to bed early, and the charm worked most effectively on Christmas Eve, or on the first and third of a new moon. In some parts of the Midlands a practice existed at one time of offering a branch of mistletoe to the first cow that calved after New Year's Day in order to keep bad luck away from the dairy throughout the year.

It was possible in olden times to produce a medicine cheaply, which was warranted to cure all ills. This was done by soaking mistletoe in water and drinking the latter. We can only imagine that people must have been easily satisfied in those days, for some of the old herbalists tell us that mistletoe berries made superior birdlime to holly, whilst they are very decisive as to the evil effects which ensue if birdlime is taken as a medicine.

However mistletoe came to be so popular matters little; the side of the question which troubles most people is the fear that its popularity should wane, for in some districts of England, particularly Herefordshire, Gloucestershire, and Worcestershire, immense consignments are sent to the various large markets every year, whilst it is sent from Normandy also in large quantities. In some parts of the country it is difficult to keep mistletoe from spreading right through an orchard, whilst in others there is almost an equal difficulty in inducing it to grow at all. It appears to find most satisfactory conditions where the atmosphere is humid, and the temperature moderately warm. In such places, berries rubbed into a rough place on the bark, or into a fork between two branches, is quite sufficient to start a growth. A section cut through a branch on which mistletoe is growing will reveal the curious growths called "sinker roots," by which the parasite obtains nutriment from the host. When a colony has been started it may be found that no berries will appear. This will possibly be due to one sex only being represented, for it must be understood that male and female flowers are borne by different plants.

W.

Abutilons.—Among the greenhouse plants of which flowers may be obtained during the winter, and, indeed, throughout the greater part of the year, must be included the different garden varieties of abutilon. They may be grown as bushy plants, from two feet high, and upwards, or as tall standards, in which way their strictly pendulous blossoms are seen to advantage. For the same reason they are well suited for training to the roof of the greenhouse, while their quick growth stands them in good stead for furnishing the pillars or back wall of the same structure. There is a long list of varieties, but many of them greatly resemble each other. A good selection is Boule de Neige, white, Sanglant, red; Golden Fleece, yellow; and rosæflorum, pink.—W. T.

A GOOD COOKING APPLE.

Norfolk Beauty.

This apple is said to be a chance seedling from Warner's King and Waltham Abbey Seedling, originating in Norfolk. It was introduced by Mr. W. Allan, gardener to Lord Suffield, Gunton Park, about ten years ago. Undoubtedly it possesses points that remind one very much of these two sorts. In shape it follows the latter more closely, being like it in the eye and not so flat as Warner's King, while being more rounded near the apex than that old favourite. In colour it more resembles Waltham Abbey Seedling, with a deep yellow skin when kept awhile, and generally showing traces of the russety specks of that variety. At times it shows a slight trace of the faintest red on the sunny side, but it is seldom that this happens as in the case of its other parent, Warner's King. D. T. Fish is said to be synonymous with Warner's King, and I have not been able to detect any difference in the two (having grown them both side by side for many years) except in the question of colour, and this slight tinge of red comes out in fruit of D. T. Fish, whereas I have not seen it in Warner's King; therefore this tint may come to Norfolk Beauty through its parent.

I look upon Norfolk Beauty as a distinct and desirable culinary apple that will eventually take the place of both Warner's King and Waltham Abbey Seedling. The former, I regret to say, appears to be so weak in its constitution of late that we do not obtain the heavy crops from it that we were wont. The fruit, too, seems much more liable to "scab," and certainly the trees are much more affected by canker than formerly. This is not my experience only, but one shared by many growers, especially in Kent. Waltham Abbey Seedling is too shy in bearing, therefore of little value.

The great point in Norfolk Beauty is its consistency in cropping. I have many times seen the original tree at Gunton Park in summer, and never saw it without a good crop, even when apples were generally scarce. The tree is not an excessive grower, but quickly forms fruiting spurs if not pruned too closely. In all forms of growth it is a success, especially as a half-standard, enabling other crops to be grown between it conveniently. As to its season or its keeping qualities, I am a little puzzled. When I first saw it the fruit kept finely until the middle of January, or a little later, but during the past four years the difficulty has been to keep it until November. The cold sunless seasons experienced may have had much to do with what I hope is not a permanent defect. In any case, I look upon Norfolk Beauty as a distinct and good addition to an already long list of kitchen apples.

E. MOLYNEUX.

Norfolk Beauty in Scotland.

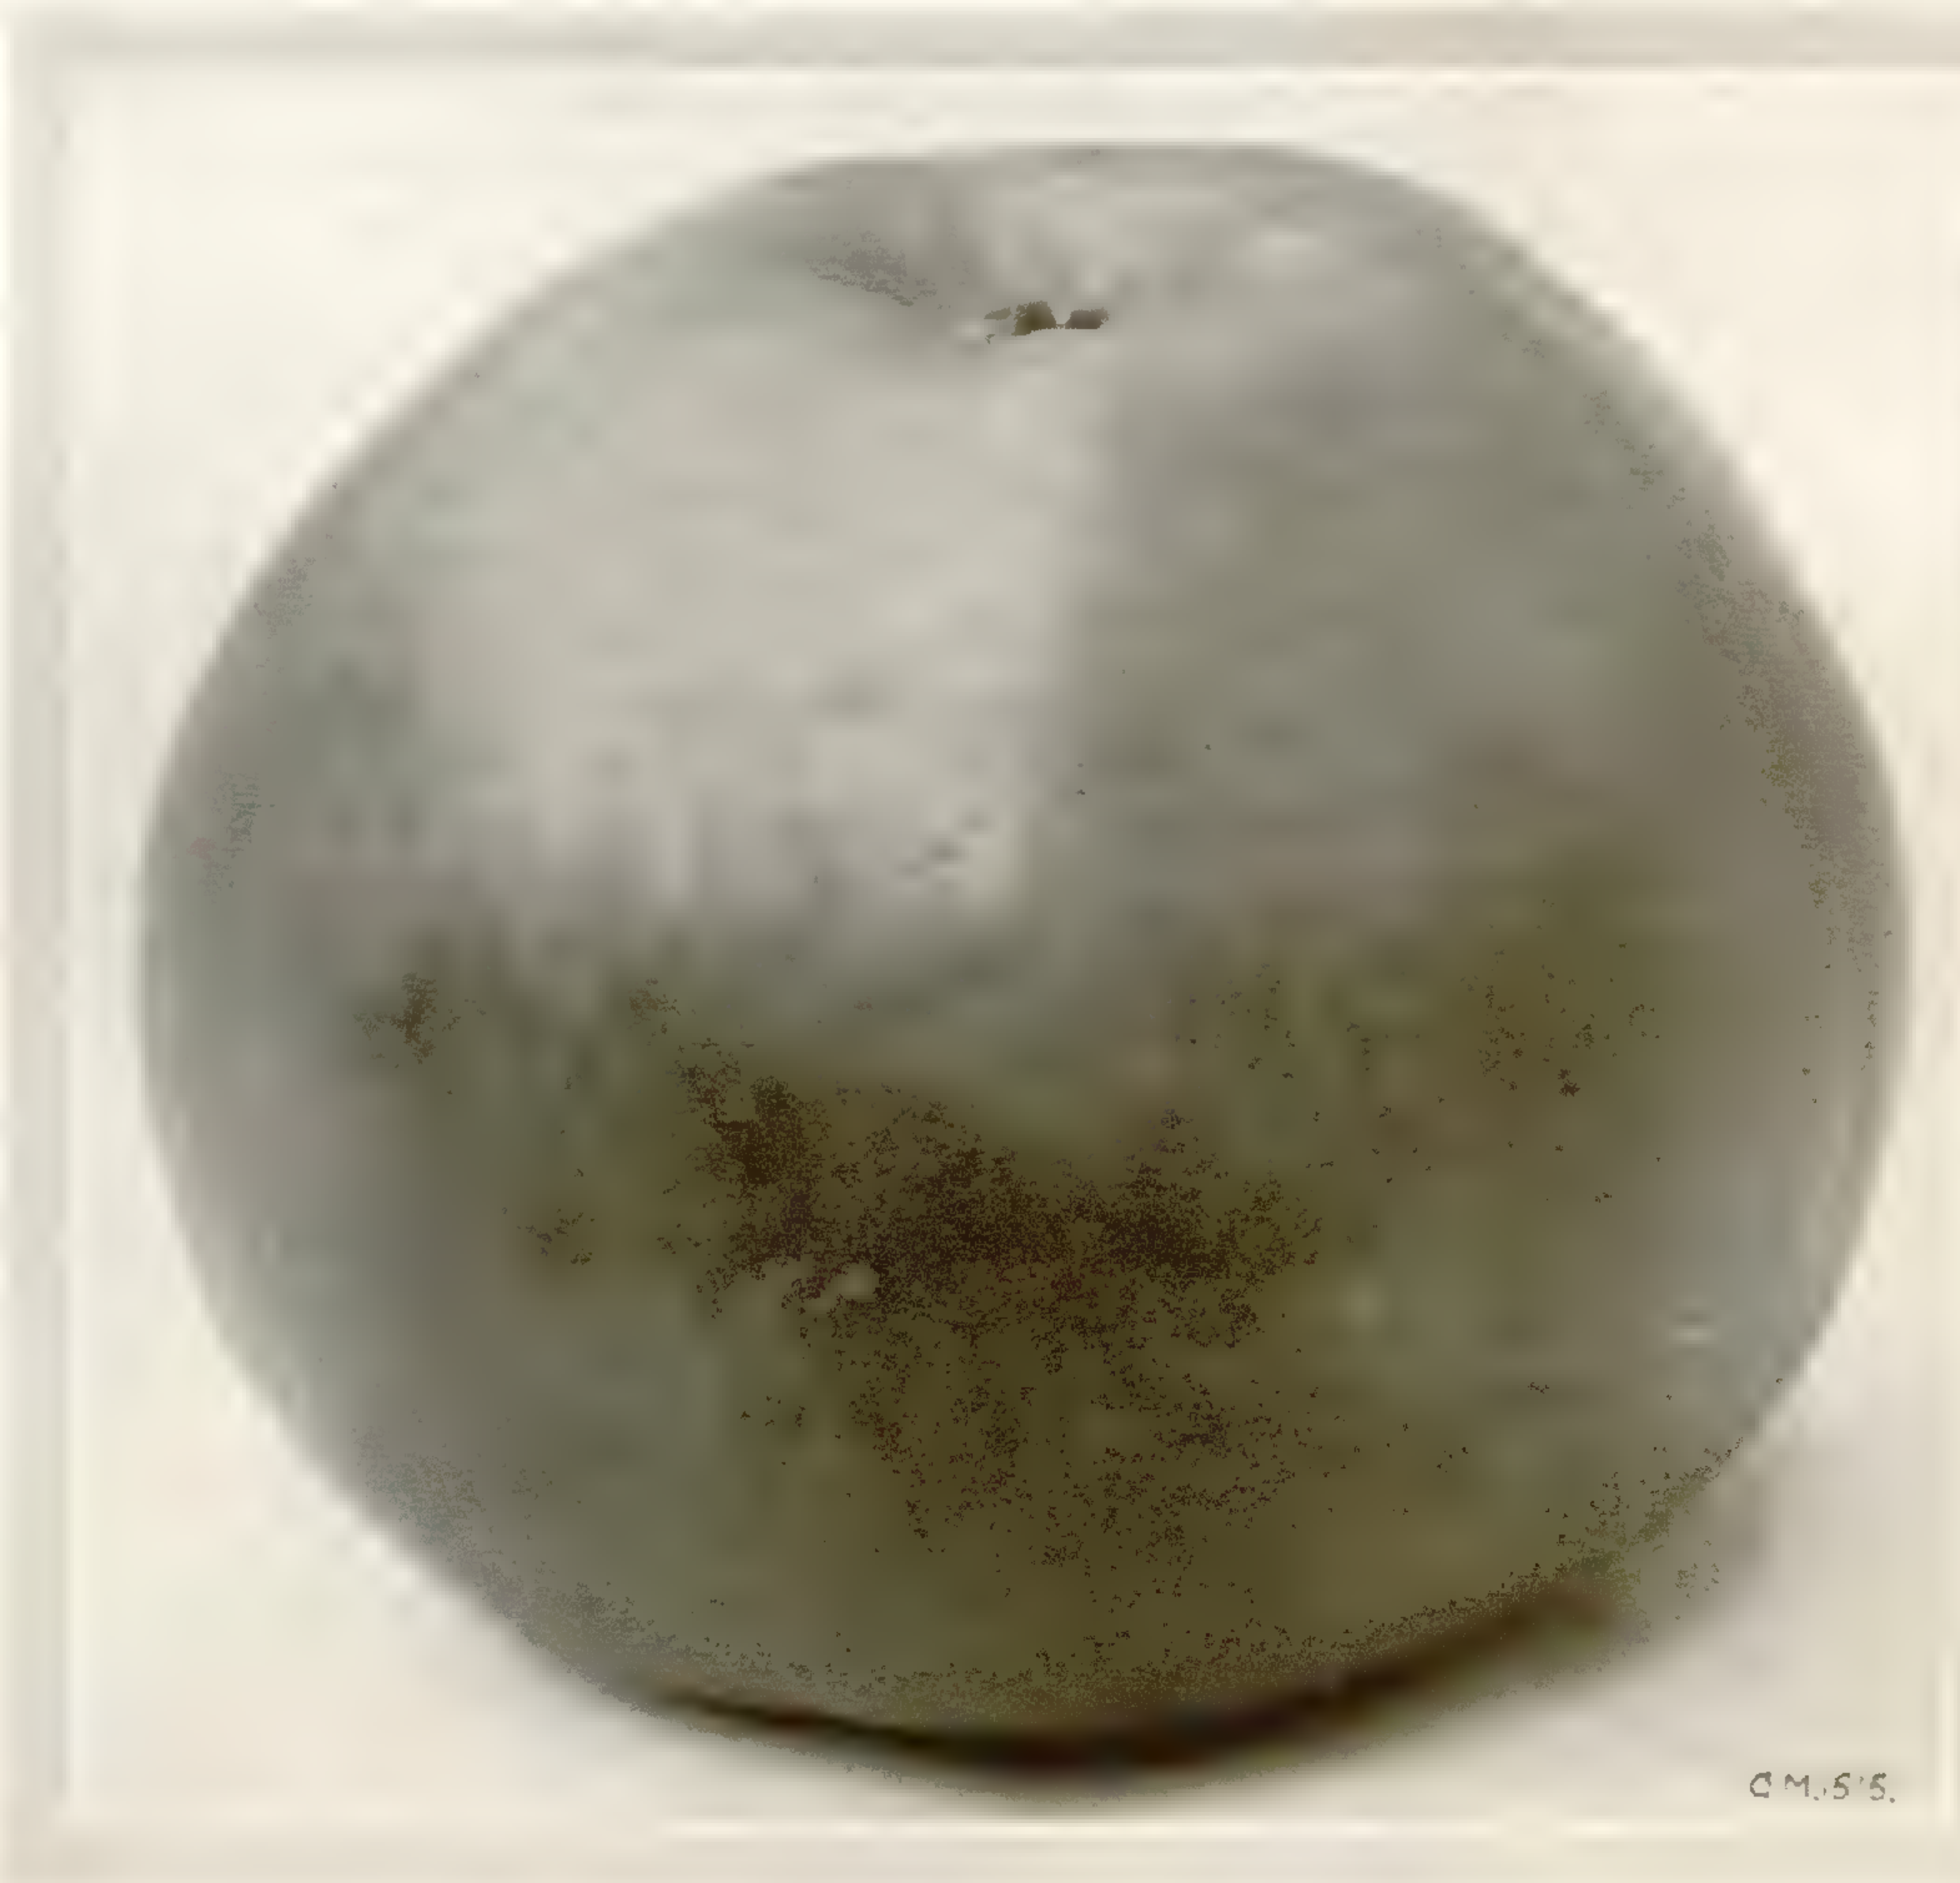
A few years' experience of this comparatively new variety, from the maiden plant to the fruiting stage, gives convincing proof that it is certain before long to become very popular in the northern parts of the kingdom, as it is already in the south. Grafted upon the paradise stock it grows with easy freedom, and planted in the open garden soon makes a very shapely bush tree, without much attention by way of pruning or training being required.

At an age of from three to five years fruiting begins, and, so far as can be ascertained at present this is continued with good regularity afterwards.

In form and size the individual fruits very closely resemble those of Warner's King, but the general contour is rather more even, and the blemish that so frequently appears beneath the surface upon large specimens of the last-named have, so far, never been a prominent feature in this.

While growing, and until the time arrives for gathering, except in the case of wall-trained trees, the fruits continue green, but, after being stored for a few weeks, this is gradually replaced by rich deep yellow over the whole surface, and so remains for a long period.

As a culinary fruit Norfolk Beauty is in season from October until February or even later, when the autumn weather is favourable, thus allowing of thorough maturity being possible of attainment while yet the fruit is upon the tree.



COOKING APPLE NORFOLK BEAUTY.

For exhibition it is sure to be largely grown in future, it having three very essential qualities—size, form, and high and distinct colour to recommend it.

JAMES DAY.

Aucuba japonica vera.—Of the female aucubas, that is to say the berry-bearing forms, one of the very best is that grown generally under the above name. It is much less vigorous in growth than some of the others, being of a freely branching habit, and with rich shining green leaves. Even on small examples the comparatively large bright scarlet berries are borne in great profusion. Grown in pots, it is particularly valuable for decorative purposes under conditions where more delicate subjects would be liable to injury. Delightful groups of this particular form may be often seen at the autumn and winter meetings of the Royal Horticultural Society. In order to obtain the very best results artificial fertilisation is necessary, but out of doors a close association of the berry and pollen bearing forms will ensure a good crop of berries.—W. T.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CATTLEYAS AND LÆLIAS AND THEIR HYBRIDS.—Some of the early-flowering cattleyas, such as C. Trianæ and C. Percivaliana, among the species and numerous hybrids, will have their flowers advancing rapidly. Very often difficulties are experienced at this season of the year, when high winds are prevalent, in retaining the flowers in a satisfactory condition after they have become fully expanded. An excess of atmospheric moisture, with a low temperature, will be almost certain to cause damp-spotting of the floral segments. In some cases it may be only minute, in others the disfiguring spots will render the flowers absolutely useless. It is not an easy matter to avoid these, for when the conditions suitable for the expanded flowers are provided, one is liable to have unsatisfactory results from the buds expanding, while other plants may have growths developing which would suffer from dry conditions. It is desirable, therefore, to retain the flowers in good condition by devoting a portion of the house to them in which the damping, to some extent, may be prevented. Where a house is set apart for plants in bloom the difficulty is practically disposed of, as the necessary conditions are thus more readily provided.

THE MEXICAN SECTION OF LÆLIAS, and more especially L. anceps, will be expanding their flowers, the blooms of the normal coloured form being the first to attain full development. The whole of the numerous L. anceps varieties are exceedingly useful for house furnishing and decorative purposes. Providing the plants are kept out of direct cold draughts they take no harm in a cool dry room while in flower. In using them for cut flower purposes they do not last well unless the plants have been subjected to a cool temperature for a few days before they are cut; this is perhaps more remarkable in the coloured than in the white varieties. Such varieties as L. a. Dawsoni, L. a. Schrœderæ, L. a. Williamsi, L. Stella, and L. a Sanderiana will have their buds in an advanced stage of development. The flowers of these are especially liable to damp-spotting. A good method to overcome the difficulty with these is to remove them to the resting house. Cooler conditions, accompanied by a corresponding reduction in the atmospheric moisture, are desirable for the plants as soon as the flowers have become fully expanded, and this also will suffice to prolong the season of flowering.

MEXICAN LÆLIAS.—The whole of the Mexican lælias should be placed under resting conditions immediately the flower scapes have been removed. Only sufficient root moisture will be necessary to retain the pseudo-bulbs and foliage in a plump state during the whole of the season of rest. The white varieties especially require a thorough ripening to induce them to bloom satisfactorily. Repotting is best deferred until the new roots make their appearance, and the plants are starting into new growth. The plants should be examined for scale at this season, for if not dislodged without delay they will injure the new growth early in the season.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—Stock plants for the production of cuttings should be placed in a light frame or glasshouse to ensure sturdy growths. Cuttings of many varieties should now be inserted and the insertion of others should be effected as soon as they are available. A suitable place in which to root the cuttings is a small frame placed on the staging in a cool house. The cuttings should be inserted in a light sandy compost in small pots. A suitable mixture of soil consists of two parts leaf-soil and one part fine loam, with a plentiful addition of sharp sand. Press the soil moderately firm, and insert the cuttings with the least possible delay.

PLANTS IN FRAMES.—At every opportunity when the weather is favourable plants in frames should be examined. Watering should be done with care, as many of the plants are comparatively inactive at the roots in mid-winter, and need very little moisture. Those in a more active condition, such as calceolarias, humeas, marguerites, and cinerarias, should be allowed plenty of room between the pots, and be watered whenever necessary, for they must not be allowed to become dry at the roots.

FREESIAS are making satisfactory growth, and, having filled their pots with roots, they should be given occasional waterings with weak liquid manure. These bulbs do best on shelves near to the glass. The flowers, even if few, are much appreciated in the drawing-room for their delightful perfume.

ROSES IN POTS.—These should be pruned and brought forward in batches according to requirements. If placed in a moderately warm greenhouse they will readily start into growth, but in view of unfavourable weather continuing it would not be practicable to hasten their growth by increasing the temperature beyond 45 or 50 degrees. Spray the plants on fine mornings, but do not apply much water at the roots until they are in active growth.

SALVIAS.—As these pass out of bloom select a few of the best, shorten the growths, and syringe with some suitable insecticide. Afterwards place them where they will have the advantage of a moist atmosphere. When the new growths are two or three inches long they may be used as cuttings.

ZONAL PELARGONIUMS that are now in bloom will need to be watered with great care. Keep them rather on the dry side, as pelargoniums can stand drought in the winter without injury. On fine days a free circulation of air will dry up the moisture and maintain a fresh atmosphere.

CARNATIONS.—When good cuttings of the tree and winter flowering varieties can be obtained, they should be inserted with a view to raising plants for flowering next autumn and winter. By propagating the plants early they will have a longer season of growth, and this will permit of extra stopping, which will be especially useful in varieties not naturally of a bushy habit. The best cuttings are obtained from basal shoots pulled from the plants with a portion of the old wood attached, the cuttings being about three inches long. Insert the shoots singly in thumb pots, or around the sides of three-inch pots. Use a mixture of sifted loam three parts, and leaf-soil one part, adding plenty of sand; make the cuttings very firm in the soil, and plunge in a frame with a bottom heat of 65 to 70 degrees, and maintain a moist atmosphere. If the cuttings are given one good watering previous to the pots being plunged, they will not require water until the roots are formed, which will be a month to six weeks.—W. Staward, Preston Hall Gardens.

THE FLOWER GARDEN.

YELLOW-BERRIED HOLLIES are by no means plentiful, and are seldom met with; whilst the commoner kinds are plentiful everywhere. A specimen in the grounds here of the yellow-fruited variety is most attractive as a shrubbery plant, and at once arrests the attention. This variety affords a pleasing change to the scarlet varieties, and produces its berries in the greatest profusion year by year.

EVERGREEEN SHRUBS might still be planted during open weather, and especially if they have not to undergo a long journey, and are plentifully supplied with roots. Under no circumstances must they be allowed to remain for any length of time with their roots uncovered, for they suffer greatly by such exposure, whereas by careful and timely attention new roots quickly push forth after planting, and the shrubs speedily become semi-established in their new quarters.

HERBACEOUS BORDERS should receive due attention now that most of the perennial plants are cut down; a suitable top-dressing, such as decayed stable manure, leaf-mould, or decayed loam, should be spread over the surface of the soil, and be carefully pricked in with a fork. The dressing should not be dug in with a spade, as such an operation cannot be too strongly condemned. On cold, wet soils the dressing might be left on the surface of the border until the spring, but not for any length of time after the plants show signs of new growth, when care must be taken not to damage these whilst the operation of digging in the dressing is in progress.

CLEMATIS of all the Jackmanni type may now be pruned and top-dressed; the growths should be shortened back to within a few inches of the level of the ground; one of the best dressings we know if is cow manure. Apply a good dressing, as it is well nigh impossible to make the soil too rich for so gross a feeder as the clematis.

BORDER CARNATIONS now occupy an important place in most gardens, and through stress of circumstances they often occupy places in the herbaceous border. To do them justice and grow them well they should, whenever practicable, be planted by themselves in separate beds or borders. Timely attention to the preparation of the soil should be made, so that it may be in proper working condition when the time arrives for planting. Although carnations delight in a deep, rich, loamy soil, yet with proper care and preparation satisfactory results will be obtained in a much poorer soil. On light or sandy soils, mulching with short, or decayed manure, soon after the plants start into growth, will aid greatly in keeping them in health, and in giving a succession of bloom. It is quite certain that a sandy soil is more productive of roots than a cold, heavy soil would be, consequently plants growing under such conditions and under good management cannot fail to produce plenty of bloom. Carnations now in frames should be occasionally looked over, and all decaying foliage carefully removed. Should the surface of the soil have become green, it should be stirred with a pointed label, or rubbed over with the fingers. A sharp look-out should be given for green-fly, which, even during the winter months, will make its appearance if the weather is mild. Water should be given very sparingly for some time to come, and upon every favourable opportunity give the plants an abundance of fresh air. A stagnant moist atmosphere is fatal to the successful cultivation of carnations of any kind, and should be carefully avoided, especially where rust is inclined to be prevalent.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

CRAB APPLES.—Usually these fruits are not appreciated to their full value, and consequently trees are not planted in many places. Apart from the utility of the fruit, they form beautiful ornamental trees; in the spring they flower profusely, and their bright-coloured fruits are most attractive in the autumn months. The fruit when ripe has a brisk acid flavour, and is in great demand for making preserves. The crab apple is easily cultivated, and will thrive and bear good crops of fruit when planted in any ordinary garden soil, in fact it will grow in soils and situations where it is impossible to grow other kinds of fruit. Standard grown trees are to be preferred to any other form of training. The trees require very little pruning; all that is necessary is to thin out and regulate the branches in a judicious manner. There are many varieties to select from, and the following can be thoroughly recommended; Pyrus baccata (the Siberian crab), both the red and yellow varieties; Victoria, and Mrs. John Seden. These are all upright growers, and soon form handsome heads, and give good returns. The planting of crab apples should not be confined to the fruit garden proper, for they produce a charming effect when they are associated with other flowering and ornamental trees and shrubs in the pleasure grounds.

PRUNING CORDONS. — The leading shoots should be left as long as possible, but at the same time it will be necessary to shorten them sufficiently to ensure the buds to break evenly. It should be borne in mind that where the undue shortening of the leading shoots is resorted to this only induces stronger growths, and the formation of but few, or any, buds will be the result: the side shoots should be cut back to two or three buds, in the ordinary way. When pruning operations are finished the trees should be sprayed with some approved winter wash, and the work of refastening them can be proceeded with.

GENERAL WORK.—Well-ripened shoots should be selected if any grafting has to be done in the spring. These should be tied up in neat bundles, with their names attached, and heeled in under a north wall until required for use. Any trees which have to be grafted can be headed back at the present time and the branches consigned to the fire-heap. It is a wise plan when heading large trees back at this season of the year to leave the branches which have to be operated upon fully six inches longer than is required. This will necessitate, at the proper time for grafting, their being shortened back to their proper length, when it will be found that the bark and wood is in a fresh green condition. This will materially assist in grafting operations being carried out successfully. Lose no time in having all fruit plantations cleaned up, and if the weather permits lightly fork over the surface soil, and mulch the trees without delay. Generally speaking, fruit is not keeping well this year, so strict attention should be paid to the removal of all fruits that show the least sign of decay. Keep an even temperature in the fruit room at all times to avoid condensation of the moisture in the atmosphere.—Henry R. Farmer, Cardiff Castle Gardens.

USEFUL GUIDE TO GARDEN WORK.—A handy all-round guide to work in the garden month by month is the Gardening Year Book, by George Gordon, V.M.H., price 1s. net from booksellers, or by post 1s. 3d., from W. H. and L. Collingridge, 148, Aldersgate Street, London. The book is freely illustrated, and the cultural details thoroughly practical and up to date.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM CERES MAGNIFICUM.

This is by far the finest of the forms of the charming hybrid between O. Rossi majus and O. Rolfæ. It differs from the other varietal forms in having the sepals almost covered with crimson blotches and spots, while the colouring on the petals is very rich and ample. The lip is pale rose. F.C.C., R.H.S.; December 20. Messrs, Charlesworth and Co., Haywards Heath.

ODONTOGLOSSUM WARSCEWICZI LEUCOCHILUM.

A very distinct variety of an old species. In this instance the sepals and petals are deep rose, edged with white, and the big lip has a crimson-purple base, and a broad border of pure white. A.M., R.H.S., December 20. Messrs. Charlesworth and Co., Haywards Heath.

CYPRIPEDIUM DANTE ROTUNDIFLORA.

An interesting hybrid between C. Hera Euryades and C. Charlesworthi. The flower is of rounded outline. The dorsal sepal is blush white, with a rosy stain over the base; the petals are green and pale purple, and the lip brownish. A.M., R.H.S., December 20. Lieut.-Colonel Sir G. Holford, Westonbirt, Gloucester.

LÆLIO-CATTLEYA PAULINE.

A pretty hybrid between L.-c. Ophir superba and C. labiata alba. The flowers are of moderate size, and there were five of them on the spike. The petals and lip point forward rather much. The flowers are bright cream colour, with light bluish purple marks on the centre and apex of the lip. A.M., R.H.S., December 20. Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

CYPRIPEDIUM GASTON BULTEEL.

A fine cypripedium, with a very broad dorsal sepal; white, tinged with rose, and with crimson veinings. The sepals are green, with crimson lines, and the lip is of similar colour, but darker. A.M., R.H.S., December 20. Mr. E. V. Low, Haywards Heath.

CARNATIONS.

Lady Alington.—A large and well-formed British seedling of the perpetual type; the colour is clear soft salmon-pink. F.C.C., P.F.C.S., December 13. Messrs. Stuart Low and Co., Enfield.

R. F. Felton.—A very large perpetual-flowering variety of good form and substance; the colour is rich bright rose-pink—a beautiful self. F.C.C., P.F.C.S., December 13. Mr. H. Burnett, Guernsey.

Rex.—In this perpetual variety the flowers are very decidedly fringed. They are of good size, and the colour is bright pink. A.M., P.F.C.S., December 13. Mr. C. Engelmann, Saffron Walden.

Mrs. T. M. Crook.—A large perpetual-flowering variety with broad, lightly-fringed petals. The ground colour is deep reddish rose, but this is heavily flaked and speckled with bright crimson. A.M., N.S.P.S., December 13. Messrs. Stuart Low and Co., Enfield.

CHRYSANTHEMUM EMILY SMITH.

A beautiful single variety that comes well in spray form, and is of highly decorative character. The blooms are of good form, the florets of even width throughout until they reach the rounded point. The colour is rich and bright yellow. A useful variety for so late in the season. F.C.C., N.C.S., December 19. Mr. Phillip Ladds, Swanley Junction.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Sweet Pea Society.

The annual meeting of the members of this society was held at the Hotel Windsor, Westminster, on Thursday, December 15, at 3 o'clock. There were about a hundred present, including several ladies, and the President, Mr. N. N. Sherwood, V.M.H., was in the chair. That the members take the closest interest in the society's work was evident throughout the proceedings, and by the fact that so many attended in spite of the dreadful weather prevailing.

After the usual formalities of such a meeting, the Hon. Secretary read the report and financial statement for the year 1910, which was practically as follows:

REPORT OF THE COMMITTEE FOR THE YEAR 1910.

During the year 1910 sweet peas behaved much better than in 1909, and flowers were produced in great beauty and profusion by practically all who cultivated thoroughly. There were numerous complaints regarding "streak" and other evils, but these were not so frequent as in 1909. Comparatively few new sweet peas were offered early in the year, and probably this had the effect of reducing the enthusiasm of those amateurs who love novelties.

The membership of the society shows no great increase upon that of 1909, because the accession of one hundred and sixty-six new members is heavily discounted by the losses. In many instances it would seem that if members do not pay their subscriptions early in the year, they ignore subsequent reminders of their indebtedness, and so fall out of the ranks. Remembering how widespread is the love for and culture of sweet peas, it cannot be allowed that the Society has yet reached the high-water mark of membership. The committee feels that, considering the good work the society has done, and is capable of doing, the members should make a point of securing new adherents to the society. There are now about one thousand members, and one hundred and nine societies in affiliation.

Financially the society is in a very satisfactory position. Fifty pounds were placed on deposit early in the year, out of the balance from 1909, and it has not been necessary to touch that sum. Indeed, a further sum of fifty pounds has been placed on deposit, every liability has been discharged, and a substantial balance is carried forward.

The experiment of holding a two days' exhibition at the Royal Horticultural Hall proved most successful. The display was a particularly fine one, competition being keen and the flowers good. Every vase was filled up with water at the close of the first day, and as a result the flowers remained in excellent condition throughout the second day. The takings at the doors exceeded expectations, therefore the committee has felt justified in arranging for a two days' show at Westminster in 1911, and the dates fixed are July 11 and 12.

After winning it at Dublin in 1908, and at Saltaire in 1909, Mr. Thos. Stevenson won the Provincial Cup (presented to the society by Mr. Ernest J. Edwards), at Luton, in 1910, and so the handsome cup has passed into the possession of his employer, E. Mocatta, Esq., while Mr. Stevenson has three gold medals to prove his success.

Beautiful weather favoured the society on the occasion of the outings. One trip was to Feering, where, at the invitation of the President, Mr. N. N. Sherwood, V.M.H., a large number of members inspected the extensive trials of sweet peas and other flowers grown by Messrs. Hurst and Son. Mr. Sherwood's delightful private garden at Prested Hall was a further attraction, while in the matter of hospitality—well, it was characteristic of the Sherwood family. Later in the day the members visited Messrs. Dobbie and Co.'s grounds at Mark's Tey, and inspected another fine lot of sweet peas. On July 14 numerous members of the society proceeded to the Times Experimental Station, Sutton Green, Guildford, to inspect the society's trials. The sweet peas were in grand condition, and the trials of intense interest. Lord and Lady Northcliffe very kindly provided luncheon and tea, and also threw open their charming gardens at Sutton Place for inspection—kindnesses that were very highly appreciated.

The trials were conducted by Mr. Chas. Foster, at Guildford, to the great satisfaction of both the Floral and the General Committee. There were two hundred and forty-two novelty trials and seventy purity trials. All those who sent stocks for trial were furnished with a copy of the Proceedings of the Floral Committee, and similar copies have more recently been sent to every member of the society. The members of the Floral Committee again lent experience and gave their time to the society, and accomplished a large amount of good work. The thanks of the society are hereby tendered to them. The result of their labours is already in the hands of the members, and much of it has proved of immense value to seedsmen and amateurs in many other lands than our own.

At the dinner held on the first day of the exhibition in 1910 there was a very general and hearty expression of opinion that the members should recognise in some tangible fashion the many services ably rendered by Mr. Chas. Foster in his capacity of Superintendent of the society's Trials, and also the many gracious acts of kindness and hospitality extended to members by Mrs. Charles Foster, both at Reading and at Sutton Green. To give effect to this opinion a small committee was formed, consisting of Messrs. N. N. Sherwood, W. Cuthbertson, W. P. Wright, Robert Sydenham, and T. Stevenson. A substantial sum has been voluntarily subscribed, and a canteen fitted with silver purchased for presentation to Mr. and Mrs. Foster.

The horticultural world is looking forward with keen expectation to the great International Horticultural Exhibition to be held in the grounds of the Royal Hospital, Chelsea, in May, 1912. The National Sweet Pea Society has offered £25 to the promoters of this exhibition, and will guarantee a further £25 in the event of a financial loss on the undertaking. Mr. N. N. Sherwood has promised a fine silver cup for sweet peas, and the society has further offered one of its gold medals. Messrs. Walter P. Wright and Chas. H. Curtis are the society's representatives on the General Exhibition Committee, and other sweet pea celebrities who are either on the Executive or General Committee include Messrs. N. N. Sherwood, V.M.H., W. Cuthbertson, J. Green, R. H. Pearson, A. W. Sutton, V.M.H., G. Gordon, V.M.H., Robt. Sydenham, Chas. Foster, Horace Wright, E. Molyneux, V.M.H., J. S. Brunton, E. Laxton, F. W. Harvey, and E. F. Hawes.

The society's Editors promise, among others, the following items in the "Sweet Pea Annual" of 1911: Report of the Floral Committee; Annual Report and Balance-sheet for 1910; Conference Proceedings; Audit of the London show; Report of the Pathological Committee; Prize-winners at the London Show; Lavender Sweet Peas, by Mr. Thos. Stevenson; Sweet Peas in British Columbia, by Mr. S. B. Dicks; The Bibliography of the Sweet Pea, by Mr. C. Harman Payne; Notes on the Guildford Trials, by Mr. Chas. Foster; The Prices of Sweet Peas, by Mr. W. Lumley; The Society's Outings, etc.

The Committee wishes to gratefully acknowledge its indebtedness to the Horticultural Club for the loan of its room for committee meetings, and to place on record its appreciation of services rendered by the Horticultural Press.

FINANCIAL STATEMENT FOR THE YEAR ENDING NOVEMBER 30, 1910.

The President, in moving the adoption of the report and financial statement, referred to the great work done by the society in the few years of its existence, and to the splendid financial position now arrived at. He was proud of the progress made during his year of office. Mr. Alexander Dean, V.M.H., seconded the motion, and in doing so remarked upon the great evidence of progress shown both by the report and the excellent financial position. He was glad that comparatively few (five) awards had been made to new sweet peas, and hoped that the Floral Committee would always be particularly careful in hall-marking a variety. He congratulated the Messrs. Dobbie on securing three of the awards. Referring to the International Exhibition of 1912, Mr. Dean said that, though few sweet pea flowers from out of doors could be expected, he hoped the traders and wealthier amateurs would combine to place before the world on that occasion a good representation of the flower in its many varieties from under glass. The motion was carried unanimously.

Thanks to the various officers and committees were proposd by Mr. George Gordon, V.M.H., and Mr. F. H. Chapman. Lady Northcliffe was elected president for 1911 on the motion of Messrs. S. B. Dicks and T. Want; this is the society's first lady president. Mr. John Collingridge moved the reelection of Mr. Edward Sherwood as treasurer, and pointed out that the Sherwood family had always been intimately associated with the financial work of the society; this was seconded by Mr. Alex. Malcolm, and carried. Mr. G. W. Leak, Wisbech, was, on the motion of Messrs. H. J. Wright and C. W. Breadmore, unanimously elected chairman of committee for the year 1911, and on the motion of Messrs. Andrew Ireland and J. Harrison Dick, Mr. Richard Gluyas was re-elected auditor of the society's accounts.

Mr. W. Cuthbertson moved that Mr. Chas. H. Curtis be re-elected hon. secretary of the society, and that he be presented with a honorarium of 60 guineas for his services during 1910. He eulogised the services of the hon. secretary, who, he said, was ably assisted in his work by Mrs. Curtis. He also pointed out that the society had not yet even acknoweldged the services rendered by Mr. C. H. Curtis and Mr. Horace J. Wright as Editors of the society's "Annual." Mr. J. S. Brunton seconded the motion, and it was carried with acclamation. Mr. T. Stevenson moved, and Mr. F. W. Harvey seconded, "That the General Committee consist of thirty-six members, with an additional eight provincial corresponding members, the latter to be added by the elected General Committee, and not subject to the rule as to two attendances per year." This was carried, and after the ineligible member had been struck off, and further members nominated, the meeting proceeded to ballot for the committee, Messrs. Brunton, Stevenson, Hawes, and Herbert Jones acting as scrutineers. Later in the meeting the result of the ballot showed that nearly all the old and eligible members were re-elected, with the addition of Dr. Phillips, Major Cautley, Messrs. F. W. Harvey, Arthur Hallam, H. E. Bide, and Lionel P. Perkin.

At this stage of the proceedings the President said that he had now to perform the most pleasing duty that fell to him in his year of office, and that was to acknowledge on behalf of the members, the services rendered the society by Mr. Chas. Foster as superintendent of the trials, and the kindnesses extended by Mrs. Chas. Foster. He reviewed the work of the trials at Reading and at Guildford, and showed how they had grown from 150 rows to about 380 rows, and that the sweet peas had always been finely cultivated. The idea of presenting Mr. and Mrs. Foster with a testimonial was a spontaneous one. Mr. W. Cuthbertson had been the prime mover in securing a tangible expression of the members' wishes, and a sum of about £40 had been subscribed. A case of solid silver table silver had been purchased, and still a little remained for the purchase, he suggested, of a piece of jewellery for Mrs. Foster's personal wear. His one regret, and one in which all would join, was that owing to recent severe illness it was impossible for Mr. Foster to be present that afternoon. They were all glad to hear he was progressing favourably, and glad that Mrs. Foster was there to receive their gift. He then formally handed over the case of silver amid the applause of the members. On behalf of Mrs. Foster and her absent husband, Mr. Horace J. Wright returned thanks for the beautiful present.

Mr. Walter P. Wright, speaking at some length, and stating that he believed there was some need, as well as a fairly general wish, for an alteration in the composition of the society's Floral Committee, moved, as an instruction to the General Committee, that the Floral Committee consist of eighteen members, nine traders and nine amateurs, principals to be eligible, with the addition of a chairman elected by the General Committee from outside the other members of the Floral Committee. Mr. Lumley seconded the motion, and caused a little amusement by suggesting what was almost an amendment to it. Mr. C. W. Breadmore, Mr. Cuthbertson, and others spoke, and the motion was carried, with only four dissentients. A further instruction, proposed by Mr. J. S. Baker, and seconded by Mr. C. W. Breadmore, was to the effect that no member on the amateur side of the Floral Committee should be in any way connected with the selling of any sweet peas. This was carried by 29 votes to 23.

The declaration of the ballot, as above stated, and a vote of thanks to the president for presiding concluded the proceedings.

EXECUTIVE AND FLORAL COMMITTEES.

The meeting of the General Committee, following the annual meeting, occupied a larger amount of time than usual. We are at liberty to state that Messrs. Hugh Dickson and H. J. Digges, for Ireland; Messrs. A. Malcolm and F. S. Halley, for Scotland; Messrs. Martin Hitchins and C. F. Faulkner, for England; and Rev. J. Jacob and H. A. Gerhold, for Wales, were the eight provincial corresponding members elected to join the General Committee. The members elected to constitute the Executive Committee were Messrs. C. W. Breadmore, W. Cuthbertson, W. Deal, G. B. Dicks, C. Foster, E. F. Hawes, E. W. King, R. H. Pearson, Herbert Smith, Thomas Stevenson, W. J. Unwin, G. F. Drayson, W. Lumley, and H. A. Perkin, with Mr. Walter P. Wright ex-officio as chairman of Floral Committee—to which position he was unanimously elected.

The Floral Committee was elected as follows: Messrs. E. H. Christy, G. F. Draysen, Robert Hallam, Thomas Jones, H. H. Lees, A. Malcolm, H. A. Perkin, Thomas Stevenson, and Commander Humphery, as amateurs, with Messrs. R. Bolton, J. M. Bridgford, William Deal, S. B. Dicks, George Herbert, Andrew Ireland, Herbert Smith, A. G. Stark, and W. J. Unwin as traders.

DINNER.

Half an hour after the appointed time, owing to the protracted proceedings, about four dozen members and Press representatives gathered at dinner, under the chairmanship of the society's treasurer, Mr. Edward Sherwood. This was a pleasant little function, and many little differences of opinion were amicably adjusted between the soup and the dessert. The loyal toasts followed, and then the Chairman proposed "Success to the N.S.P.S." in a brief and bright speech, and to this Mr. G. W. Leak, the new chairman of committee, responded.

THE CONFERENCE.

Shortly after seven o'clock Mr. G. W. Leak took the chair, and opened the conference proceedings. In the absence of Mr. Walter P. Wright his contribution on "Judging Sweet Peas" was read by the hon. secretary, Mr. C. H. Curtis.

Mr. Thomas Stevenson said that justice was not always meted out to sweet peas, because many people did not know how to judge them. He believed in putting quality before size, and suggested that the range of colours in a dozen or more bunches should receive more consideration than at present. Six to eight points per bunch would, he thought, be more workable than Mr. Wright's suggested twenty-four. Mr. Malcolm was in favour of double standards, and also the admission of haulm attached to the flower spikes. Mr. J. Fraser objected to the crowded bunches seen at so many local shows, and to the difficulty in distinguishing between some varieties if they were mixed in a vase. Mr. Weston thought some standard was needed for the blending of colours, and Mr. Usher felt that "arrangement" should not carry undue weight over quality. Mr. Felton believed that if the flowers were of fine quality that would outweigh all else; he acknowledged a preference for flowers set wide apart on the stem over those closely placed near the top of the spike.

Mr. Breadmore objected to the use of attached haulm, he thought twenty stems made an ideal bunch, and said colour blending should count, but it was difficult to estimate, because a competitor on either side or at the back of one's own set might so dispose his colours that they heavily discounted your own. Mr. S. B. Dicks plumped for quality, and urged that every other property should be quite subservient to it. Mr. W. Cuthbertson said he never counted the number of spikes per vase—it was too much work to impose upon a judge. He thought six points per vase a suitable number to work with, giving it to the best vase in class, and then working through the exhibits with the maximum vase as a standard. Mr. Christy and Mr. W. J. Unwin were in favour of double standards, but Mr. T. Stevenson thought they were evidence of coarseness.

Mr. Leak had to leave at this point, and Mr. H. J. Wright, who took the chair, summed up the discussion. He objected to coarseness of flower stem, and said that crowded bunches too often secured awards. He hoped a reasonable scheme for judging would be arrived at some day.

The next paper was by Mr. George Herbert on "Sweet Pea Cultivation."

Mr. Ireland opened the discussion, and entered a strong protest against any other method of staking than that of hazel sticks; he also objected to the excessive trenching and manuring so often practised, and also to the single or "tomato stem" method of culture, wherein all laterals were suppressed, and a flower spike or two found at the top of a bamboo stem. He advocated autumn sowing in pots, the pots plunged in ashes in a cold frame, and given abundance of ventilation. A foot apart he thought sufficient space in the rows for most varieties. Mr. Malcolm referred to the great success in germination he had obtained by sowing in sand, or by merely placing seeds on the top of the soil and barely covering them with sand. He had never suppressed the lateral growth in sweet peas even for exhibition purposes. Various expressions of opinion as to the merits of deep trenching were given by Messrs. H. A. Perkin, R. Felton, A. Usher, and Burt, but the general opinion was in favour of deep trenching. Mr. C. H. Curtis pointed out the difficulty of obtaining hazel, or other good pea stakes in the suburbs of large towns. To meet the case Mr. Unwin suggested the use of garden netting hung from wires, and referred to the use of wide-meshed wire by the Messrs. Bath. Mr. G. Pain said he had used frames made of battens and wire netting in place of hazel sticks, and with great advantage. Mr. de Merrell, Mr. Drayson. Mr. Tigwell, and Mr. L. Whitbourne all took part in the discussion. Mr. Herbert replied to questions raised, and the Chairman wound up the debate.

Hearty votes of thanks were accorded to Mr. W. P. Wright and Mr. George Herbert for their papers.

CODE OF JUDGING.

At the conclusion of the papers and discussion Mr. William Cuthbertson proposed, and Mr. R. Bolton seconded, that the following code of judging sweet peas be recommended for general use. The motion was carried unanimously:

(a) When starting, count the exhibits in each class with the secretary's assistant, to make sure none is omitted.

(b) Count the number of vases.

(c) See that the exact number of varieties specified in the schedule are present in each exhibit.

(d) Make a preliminary survey, and rule out those stands that are palpably defective, in order to be able to concentrate attention on the eligibles.

(e) Look through the vases in the selected stands for mixed types.

(f) Be prepared to make the awards on freshness, number of flowers per stem, size of flowers, disposition, and blending of colours. Compare vases of the same varieties side by side.

(g) Give a maximum of 6 points per bunch. This maximum to be allocated to the best bunch, or bunches, in the stands, and then point the other bunches, by half points if necessary, working downwards from the maximum. In awarding these points due regard must be given to freshness, quality, and size of the flowers, as referred to above.

(h) It is also recommended, where necessary (i.e., when the bunch pointing brings an equality, or nearly so) that 6 points extra be taken as a maximum for arrangement and blending of colours, the points so obtained being added to the total bunch points.

(i) Double-standard flowers should not be discounted.

National Chrysanthemum Society.

There was a very small attendance of the Floral Committee at Essex Hall on December 10, and very few exhibits. Mr. P. Ladds and Messrs. W. Wells and Co. each staged a few vases of single and late decorative varieties, and the former secured a F.C.C. for the bright yellow Edith Smith, a single variety of great beauty.

There was a large attendance of the General Committee at 7 p.m. on the above date. It was reported that no progress had yet been made with negotiations concerning dates for exhibitions at the Crystal Palace next year. Receipts to date were £526 7s., and expenditure £431 2s. 5d., leaving £95 4s. 7d. in hand. The society has now £50 on deposit, and its liabilities seem to be about £50, so that the prospects are that between £40 and £50 to the good will remain at the end of the season.

Mr. D. B. Crane reported upon the visit made by the Floral Committee to Messrs. H. Cannell and Sons' and Mr. Philip Ladds' establishments at Swanley, to inspect late varieties. Thanks were accorded to all concerned for their courtesy and hospitality. The question of publishing the proceedings of the conference held recently was raised, but the matter was deferred to the next meeting. The dates of Executive and Floral Committee meetings were provisionally fixed, but left for confirmation, or otherwise, at the January meeting.

The Floral Committee dinner was fixed to take place after the Executive Committee meeting on February 20, 1911, the committee to be held at six o'clock, and the dinner at 7.30. Thursday, November 23, 1911, was suggested as the date of the annual dinner of the society in the coming year. Three new members were elected, and Mr. J. H. Witty and Mr. D. B. Crane were nominated for an Honorary Fellowship, and Messieurs Viger, Maxime Rocheterie, and Albert Truffaut, of France, were also similarly nominated.

Royal Horticultural Society.

There was no exhibition on December 20, but all the committees met. The Floral and Fruit Committees had little else to do but sign their names and wish each other the compliments of the season, but the Orchid Committee had a good deal to do, and granted four Awards of Merit and one First Class Certificate.

Messrs. Charlesworth and Co., Haywards Heath, brought up Miltonia Warscewiczi var. leucochila, with a broad white margin round the brown and purple base of the lip; a fine plant of Lælio-Cattleya Sunray superbissima, with a splendid spike of nineteen flowers; and Odontoglossum Ceres magnificum, a beautiful flower. Mr. F. Hopkins, gardener to Francis Wellesley, Esq., Westfield, near Woking, submitted Lælio-cattleya Ophir Westfield var., very bright deep yellow; Cypripedium Etoniense, with a pair of huge blooms, and C. Lady Gainsborough, a bold flower of C. Mrs. Mostyn type, and C. Waterloo.

From Westonbirt, Mr. H. Alexander, grower to Lieut.-Colonel Sir G. Holford, brought up a fine form of Cypripedium Rossita, a seven-flowered specimen of C. Actæus var. Undine, and Lælio-cattleya Pauline (L.-c. Ophir superba and C. labiata alba), with five large creamy flowers. Mr. Hale, gardener to Samuel Larken, Esq., Ridgeway, Haslemere, brought up Odontoglossum Harryano-crispum, Miltonia Bleuana grandiflora, and Lælio-cattleya bella superba. Messrs. James Veitch and Sons, Chelsea, showed Cypripedium Clionia, with four [illegible] attractive blooms, C. May, a new and distinct hybrid between C. glaucophyllum and C. Euryades maculatum, and C. insigne Crusader.

Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, showed a plant of Odontioda Bradshawiæ, with a branching spike that was about a yard long, and had seventeen open flowers of brilliant hue, besides a number of buds.

Mr. Hunt, gardener to Pantia Ralli, Esq., Ashstead Park, Leatherhead, exhibited Cattleya Dusseldorfi Undine Ashstead Park var., with two chaste blooms.

Messrs. Armstrong and Brown, Tunbridge Wells, showed several cypripediums, C. Fairrieanum crosses that included a pair of C. vexillarium type named C. Dauphine and C. Amboyna, the former of best form and the latter of finest colour—rich rose on dorsal sepals and petals; and C. Corunna, the latter a cross between C. Leeanum and C. Fairrieanum. Mr. E. V. Low, Haywards Heath, exhibited Cypripedium Gaston Bulteel, a fine broad and bright flower.

A variegated leaved Primula sinensis from Mr. A. Card, Blue House, New Maldon; a crimson-scarlet amaryllis from Mr. F. W. Hamilton, East End, Lymington; a rather floppy single chrysanthemum from Mr. H. Woolman, Olton Road, Shirley, Warwick; and a vase of the pale yellow single chrysanthemum Peter Barnes, from Messrs. W. Wells and Co., Merstham, were all the subjects the Floral Committee had to deal with.

From the R.H.S. gardens, Wisley, came up a series of heads of forced dandelion to show their value for salading. The varieties were Improved Broad Leaved (Barr and Sons), Early Improved, very free (J. Veitch and Sons), Broad Leaved (J. Carter and Co.), Moss Leaved (Toogood and Sons), Thick Leaved (Sutton and Sons), Broad Leaved (Sutton and Sons), and Early Cabbaging (Toogood and Sons). The broad-leaved forms were in very fine condition.

Dundee Horticultural Association.

FREE-FLOWERING CHRYSANTHEMUM CONFERENCE.

This interesting conference was held in the Technical College, on the evening of the 8th inst. Mr. John Campbell presided, and called upon Mr. James Bethel, The Grange Gardens, Monifieth, to open the conference. In doing so Mr. Bethel took occasion to speak of the many horticultural conferences which had been held, to his own knowledge, during the last twenty years. One thing which struck him about these conferences was the entire absence of selfish motives by the promoters, and that debate was calculated to inspire and educate mankind to beautify the world around them, and make the earth yield her increase.

The association had already held an Early-flowering Chrysanthemum Conference, and had debated the various phases of big bloom cultivation, so that it was appropriate to have a Free-flowering Conference, as this was, after all, the most important section, and the most popular, from a decorative point of view. He grew about 500 free-flowering plants in the various groups of colours, such as white, yellow, bronze, red, purple, and crimson, pink, etc., his object being to maintain a continuous display of each group of colour from October to February. In naming the varieties in their order of flowering during the period mentioned Mr. Bethel gave some practical hints on their cultivation and decorative value, and of many of the varieties he held up blooms from his exhibit on the table, which added considerable interest to his remarks.

The following white varieties were his choice: White Quintus, J. W. Scott, Lady E. Smith, Felton's Favourite, Madame Gustave Henry, Mrs. C. Beckett, Miss Cloy Frick, Madame Ferlat (inc.), Moneymaker, Niveus, Western King, Nellie Pockett, and Heston White. His best white singles were White Pagram, Purity, Alfred Graysmark, Miss A. Abbot, Mrs. H. Herbert, etc. Yellow and bronze shades: Soleil d'Octobre, Yellow La Triomphante, Lizzie Adcock, Mrs. Greenfield, Hon. Mrs. A. Acland, Mrs. W. Knox, Cheltoni, and Romance (inc.), Bronze Le Pactole, Soleil d'Octobre, Kathleen Thomson, Source d'Or, Charles Davis, Bronze Fabire, and Bonnie Dundee. In singles Solarine, a locally raised cream variety in the way of Purity; R. N. Parkinson, Kitty Bourne, Bronze Pagram, Miss Briggs, Winnie Sherring, and Mary Richardson.

In red and crimson, and kindred shades, Market Red stood highest, in his opinion. Mons. Wm. Holmes and Roi de Brecons were earlier, and Mrs. T. Dalton and Matthew Hodgson were much later. In single varieties of these shades Dickson's Ruby was commended for table decoration; Felix was red, spangled with gold, and King of Siam darkest of all. Among single pink varieties Edith Pagram was supreme, although he (the speaker) found Emily Wills and Florence Owen excellent for table decoration, while Miss Annie Harrison and Roufell Beauty were quite distinct and useful. The decorative forms in pink shades were heralded early by O. J. Quintus, then Rubus and Caprice du Printemps, La Triomphante, Viviand Morrel, G. Mileham, Miss Olive Miller, O. H. Broomhead, Miss Dorothy Dewar, Mdlle. Melaine Fabire, Kitty Gulliver, and Framfield Pink, the two last-named ones he had never had success with, and would like to hear the experience of others with them.

Mr. Thomas Brown, Balcairn Gardens, also addressed the members, dealing with cultivation, and giving a list of the best from his own collection, which mainly corroborated what Mr. Bethel had already said. His exhibit mainly consisted of the Pagram family, and some other good single varieties, as well as a good example of Felton's Favourite not disbudded.

A good discussion ensued, when many helpful hints were disclosed, and a very profitable evening spent, the closure being applied by a vote of thanks to Messrs. Bethel and Brown, proposed by Mr. Alexander MacRae.

National Dahlia Society.

There were about nineteen persons present at the Hotel Windsor on December 20, when the President, E. Mawley, Esq., V.M.H., opened the proceedings at 2.45. The minutes of the previous annual meeting were read and signed.

The report of the committee, read by Mr. E. F. Hawes, made reference to the Dahlia Conference, the exhibitions at the Crystal Palace and at the Royal Botanic Gardens, both of which were successful. Nearly two hundred dahlias were submitted for awards and twenty-four certificates were awarded. Reference was made to the trials at Messrs. Cheal's Nurseries, to the society's literature, and to the valuable assistance rendered the society by the horticultural press. Twenty new members were added during the year.

The balance-sheet showed a turnover of £215 17s. 3d., with a small balance on the right side of 19s. 11d.

Mr. Mawley, in moving the adoption of the report and balance-sheet, regarded both as very satisfactory, especially as all prizes have been paid in full, and the conference proceedings published. The latter he considered an excellent bit of work. There was evidence, he considered, of steady progress all round.

Mr. G. Gordon, V.M.H., hoped the committee would arrange for a conference in the coming year; and he expressed his pleasure at the advances made in connection with dahlias for garden decoration; and, in view of the need for creating a substantial balance at the bank, suggested the desirability of holding one instead of two shows, or reducing the amounts offered in prizes, or in some way securing an increase of income. Mr. Joseph Cheal said it was necessary to consider the question of finance, but the matter had been discussed in committee, and the trade would be asked to increase their support. He said it was proposed to classify competitors in future, and arrange for more small classes. The motion was then carried.

A vote of thanks was accorded the retiring officers and members of committee on the motion of Messrs. Davison and R. H. Pearson. It was agreed to hold the annual meeting in future on the occasion of the last R.H.S. meeting in November. The office of Chairman of Committees was established. Some discussion turned upon a proposed enlargement of the Executive Committee from twelve to eighteen members, and Mr. Riding's motion to that effect was eventually carried, in the hope that there might be a better attendance. Mr. Mawley was re-elected President on the motion of Messrs. J. Green and G. Gordon. Mr. J. Green was added to the list of vice-presidents. Mr. George Gordon, V.M.H., was elected Chairman of Committees. Messrs. H. Peerman, H. Shoesmith, G. Davison, and G. Langridge were added to the General Committee. Mr. E. F. Hawes was re-elected hon. secretary, Mr. J. Green as hon. treasurer, and Mr. W. Stephens as hon. auditor. A vote of thanks to the President for presiding closed the proceedings.

The Perpetual Flowering Carnation Society.

The annual meeting and dinner of the above society was held at Anderton's Hotel, Fleet Street, London. Mr. J. S. Brunton presided at both functions. At the close of the dinner the annual meeting commenced, and, in moving the adoption of the report, the Chairman spoke in glowing terms of the rapid strides that had been made in improving the form, colour, and quality of the flowers of the perpetual carnations. This was ably seconded by Mr. S. Mortimer, and, with the addition to the report of a paragraph stating that the society had contributed £20 to the prize funds of the International Horticultural Exhibition, 1912, was carried unanimously. Votes of thanks to the retiring officers and committee were proposed, and carried with acclamation. Lord Howard de Walden was re-elected president, and the retiring vice-presidents, with the addition of T. S. Turnbull, Esq., Lady Derby, Baroness M. De Brienen, and Dr. Moewes, were re-elected. Mr. J. S. Brunton was re-elected chairman; Mr. S. Mortimer, vice-chairman; Mr. L. J. Cook, hon. treasurer; Messrs. H. Mathias and E. F. Hawes, joint hon. secretaries; and Messrs. C. H. Curtis and R. Pinches, auditors. As the result of the ballot for six members of committee, Messrs. A. F. Dutton, C. Engelmann, F. W. Harvey, A. Smith, F. Fitch, and J. Vert were elected. At a meeting of the General Committee, held at the close of the annual meeting, the members of the Floral Committee were re-elected en bloc for the coming year, with Mr. W. H. Page again as chairman.

East Anglian Horticultural Society.

The annual meeting of this society was held in Norwich on the 14th inst., Mr. Lewis Smith, Shotesham Hall Gardens presiding. The annual report, as presented by the secretary, Mr. W. L. Wallis, Royal Arcade, Norwich, showed that the past success had been well maintained. The total membership now stood at 331, comprising head gardeners, amateurs, and under gardeners. The financial status was sound, the report stating that there was a balance in hand of £134 8s. 11d. It went on to state that essays, lectures, etc., had been well attended, followed by good debates. The monthly competitive exhibits had provided some keen contests. Many members from time to time brought up choice or rare subjects, which always added interest to the meetings.

Following upon this the election of officers took place. Mr. L. Smith, according to rule, takes the office of president. Mr. W. Rush, gardener to F. P. Hinde, Esq., Thorpe, was elected vice-president by a large majority. Mr. W. L. Wallis was unanimously re-elected secretary. Mr. Charles Daniels was elected treasurer, and Mr. J. F. Betts and Mr. H. [illegible] auditors. The following were elected to fill the vacancies which occurred upon the committee: Messrs. W. Shoesmith, C. Matthews, J. C. Abel, D. Howlett, G. Moore, E. Greene, S. Hunt, and E. Grand. The list of competitive essays, also lectures and papers for 1911, was gone through, and adopted, and the items speak well for another good educational year.

The exhibition for the evening was a most comprehensive one, and well filled. Mr. Frank Neave, Lingwood, was congratulated for his display of pansies and polyanthus, which reminded one more of April than December. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, brought up a fine Begonia Gloire de Lorraine and a grand cypripedium. There were still some grand apples and pears.

At the close of the business Mr. J. Clayton, who has the honour of being upon the local committee, announced the action of the Royal Agricultural Society in connection with the summer horticultural show at Norwich, which action met with approval.

OBITUARY.

MR. R. MAWSON.

Mr. Robert Mawson, proprietor of the Lakeland Nurseries, and brother to Mr. Thomas H. Mawson, died, at the age of 46, at his residence, at Windermere, on the 15th inst., after an illness extending over a year. The deceased was the second son of the late Mr. John William Mawson, seed merchant and florist, of Ingleton, Yorkshire, whose widow later removed to London, where each of the three brothers received a thorough professional and practical training with some of the best known nurserymen and landscape gardeners, the eldest brother having for two years previously studied architecture. Returning North 26 years ago, they began business at Windermere, and five years later the two younger brothers, Isaac and Robert, became sole owners of the nursery business which they had established. The younger brother dying nine years ago, the business came into Mr. R. Mawson's hands. Mr. Robert Mawson, who made no profession of any special knowledge as a garden architect, possessed a thorough acquaintance with every phase of garden construction, and carried out much of the work designed by his brother.

ANSWERS TO CORRESPONDENTS.

PLANTING DAFFODILS. — Amateur: Yes, you may plant daffodils during the Christmas holidays, with the assurance of their flowering, provided they are varieties having large bulbs, such as those of the Emperor, and the bulbs were well ripened. We have, for experimental purposes, planted bulbs of Emperor as late as the middle of January, and have obtained good flowers from them, although not equal to those produced by similar bulbs that were planted in the previous October. Varieties belonging to the Barri and poeticus types have small bulbs, and are seldom satisfactory when planted so late in the season, a considerable proportion of the bulbs usually failing to bloom. It is in all cases advisable to plant daffodils early in the autumn, because late-planted bulbs, although they may bloom satisfactorily, will not make such a robust growth in the season, and produce such large, well-matured bulbs.

POTATO SETS.—R. F. M.: The tubers of the early potatoes that are of "ware" size may with advantage be cut before they are boxed up preparatory to their being started into growth. To quickly dry up the moisture on the cut portions dust these with slaked lime.

SHRUBS FOR FORCING.—R. B. S., Sussex: The number of hardy shrubs that can be successfully forced for the decoration of the conservatory and the supply of cut flowers is considerable, but in your case the preferable course will be to limit the selection to a few of the best. We would suggest that for this season you confine your attention to Azalea mollis in variety, deutzias, rhododendrons, and lilacs. If you force a goodly number of plants of each, and handle them carefully, you will have a plentiful supply of flowers. Seedling plants of Azalea mollis are in every way suitable for forcing, provided they are established in pots, and are well furnished with flower buds, and if obtained from a good nursery will yield a wide range of colour. Rhododendrons with white and red flowers are preferable for flowering under glass, and, as in the case of the azaleas, they should be well furnished with flower buds, a point not difficult to determine, as the buds are now prominent. The lilacs, to ensure success in flower production, must be well established in their pots, and two excellent varieties flowering under glass are Charles X., a fine variety with rose-lilac coloured flowers, and Marie Legraye, pure white; Rubra de Marley, a bright lilac-coloured variety, that originated on the Continent many years ago, is of much value for forcing, and also for growing in the open, although it has not found much favour in this country at any period of its history. Deutzia gracilis is still the best of the deutzias for forcing. It will be advisable to purchase strong plants of the respective kinds, and to commence with a moderate temperature. As you have not had much experience, we suggest that you let January be well advanced before you subject the shrubs to fire heat, and then, having gained experience, commence in the winter of 1911-12, either before or immediately before or just after Christmas.

UNHEALTHY CATTLEYAS.—T. S. H., Norfolk: We are afraid you have not followed the advice given by Mr. H. J. Chapman so closely as you should have done with regard to the use of leaf-mould in potting mixtures for orchids. However that may be, you have used a large proportion of leaf-mould, and supplied the plants liberally with water, with the result, judging from the plant you have sent for examination, of the material having become pasty and sour, and the roots that are within the pot have perished. We have seen many other plants in precisely the same condition as yours, but not always growing in a mixture of which leaf-mould has formed a part. All the plants in the condition of the one before us, or, indeed, approaching thereto, should be taken out of the pots, have the whole of the material removed from about the roots, and every root that is dead, or showing signs of decay, be cut clean away. Then repot, using pots of the smallest possible size, and peat fibre, to which nodules of charcoal and small crocks have been freely added. The material must be kept only slightly damp until the new roots are beginning to run freely in the mixture.

DRIED UP COB NUTS.—M. A., Essex: It is possible that the shrivelling of the kernels of the cob nuts may be due to their having been gathered before they had reached the proper degree of maturity; but as you have kept them since they were gathered in the upper part of the house we have little doubt as to it having been caused by a dry atmosphere. The proper method of keeping cobs and filberts is to pack them lightly in large jars, cover with closely-fitting lids or pieces of board, and place them in a cellar. Under these conditions they will keep in excellent condition until the winter is well advanced. If you put the nuts you have in a jar and place it in the cellar they will improve materially in a fortnight or so.

AMERICAN BLIGHT.—J. K. B., North Hants: Your apple trees are badly infested with American blight, or woolly aphis, which is one of the most troublesome pests with which the fruit grower has to contend. The most effectual method of ridding the trees of the pest will, in your case, be to well work into the crevices in which the colonies have become located, rather strong paraffin emulsion with a hard brush.

GRAPES FOR AN INVALID.—M., Liverpool: It is somewhat difficult to say which are the best late grapes for an invalid, as the tastes of invalids, as of other persons, differ materially. The showy, tough-skinned Alicante may be ruled out at once, and the large-berried Gros Colmar is of doubtful merit for the purpose, for unless the fruit is ripened in a relatively high temperature it is watery, and indifferent in flavour. Lady Downes and Lady Hutt are both richly-flavoured grapes that would probably be found the most useful.

NAMES OF PLANTS.

S.—Your cypripedium is a poor form of C. insignis.

R. B., Manchester.—1, Maranta Kerchoveana; 2, M. Baraquini.

F. B., Sussex.—1, Arbutus Croomi; 2, Andromeda floribunda; 3, Gaultheria procumbens.

W. S., Suffolk.—The blooms are not sufficiently developed to admit of their identification. Moreover, they are sent without numbers.

R. WILSON.—Your ivies are: 1, Hedera spectabilis aurea; 2, H. chrysophylla; 3, H. maculata latifolia; 4, H. Rægneriana; 5, H. digitata; 6, H. pedata.

T. B. Kent.—1, Acrostichum drynarioides; 2, Doodia aspera multifida; 3, Blechnum polypodioides; 4, Asplenium monanthemum; 5, Pteris moluccana.

S. P., Yorkshire.—1, Begonia Sutherlandi; 2, B. Ascotensis; 3, B. fuchsioides; 4, B. nitida. These begonias are not without their attractions, but they are so inferior to the newer winter-flowering varieties that we suggest you considerably reduce your stock of the kinds of which you send us specimens, to make room for some of the forms of Gloire de Lorraine, and the varieties of which Mrs. Heal is a good type.

NAMES OF FRUIT.

L. C., Alverstoke.—1, Calville Rouge d'Automne; 2, Bramley's Seedling.

W. S., Huntingdon.—1, King of Tompkin's County; 2, Court of Wick.

T. H. P., East Hoathley.—1, Hawthornden; 2, Lady Henniker; 3, Tower of Glamis.

K.—1, Le Lectier; 2, Hacon's Incomparable; 3, Beauty of Stoke; 4, Not recognised, probably a local seedling.

CATALOGUES RECEIVED.

MESSRS. SUTTON AND SONS, READING.—Sutton's Amateur Guide in Horticulture was the first of the seed catalogues for 1911 to reach us, and is, as usual, highly interesting and useful. It forms a substantial and attractive volume in which are described and the greater part illustrated, all the finest of the types of useful and ornamental plants that are usually raised from seed. The Guide is rendered additionally attractive by several finely executed plates of the firm's specialities, photographed in their natural colours.

MESSRS. JAMES VEITCH AND SONS, LIM., CHELSEA.—The catalogue of seeds issued by this firm is comprehensive, admirably arranged and attractive. It is freely illustrated, and the illustrations of the various types of flowers and vegetables are, as usual, admirably executed. With their seed catalogue Messrs. Veitch have issued a comprehensive catalogue of chrysanthemums.

MESSRS. DOBBIE AND CO., EDINBURGH.—In addition to a complete catalogue of the various kinds of seed required in the garden in the production of beautiful displays of flowers and vegetable crops of high quality, the Messrs. Dobbie include in their substantial publication lists of dahlias, violas, and other classes of flowers with which they have long been closely associated.

MR. G. H. MACKERETH, ULVERSTONE.—The seed catalogue for 1911 issued by Mr. Mackereth is well arranged, and contains selections of all the flowers and vegetables in general request, with illustrations of the more noteworthy types. The catalogue is remarkable for the completeness of the lists of new and old sweet peas, the names of the leading novelties being accompanied by notes at once interesting and useful.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The Past Year.

The year that has now reached its close has been an eventful one, and in its course has been accompanied by much that could not well have failed to give rise to a feeling of anxiety in the minds of those who take an intelligent interest in what is going on about them. It has been less kind to those engaged in gardening than could have been wished; but, as the difficulties and disappointments that have been experienced are called to mind, it is possible to feel that the results of strenuous endeavour have been more satisfactory than was anticipated even by the most optimistic of horticulturists. The year has been marked by one of the most complete failures of the crop of hardy fruits that has yet been experienced in this country. This failure was all the more serious, especially to those engaged in fruit culture for profit, from the fact that for several years past the outdoor fruit crops have been below the average, and failed to give an adequate return. This failure has given rise to some difference of opinion as to the cause, among fruit growers. Some have attributed the shortage of supplies to the imperfect development of the floral organs consequent on the immaturity of the growth in the previous years. Others, whose opinions are entitled to equal respect, have regarded the low temperature that prevailed during April and May as the chief cause of the loss of the crop. There is no occasion to discuss this point at length, with a view to effect a solution of the question, but we would suggest that the failure was due to a combination of these two unfavourable influences. Fortunately, the weather experienced during the greater part of the autumn of the current year was highly favourable to ripening the wood of fruit trees, and at the present time the flower buds are more plentiful and prominent than was the case at the close of last year. We are therefore justified in anticipating crops of the various kinds that will yield a satisfactory return for the expenditure of time and money involved in the efficient management of orchards and fruit plantations. The exceptionally large amount of bright sunshine and the high temperature that characterised the autumn months were highly beneficial in directions other than the ripening of the wood of fruit trees. The warmth and sunshine saved the potato crop by effectually checking the development of the disease just at the time when it appeared likely to be of great virulence; they placed growers in a position to obtain well-matured samples of most kinds of farm and garden seeds, and enabled farmers to ingather their crops of cereals under favourable conditions. The cold wet weather that extended over the latter part of the spring and the greater part of the summer had a detrimental effect upon the growth of both ornamental and useful plants, and greatly interfered with the enjoyment of the garden at a time when its manifold charms are the most highly appreciated. These unfavourable climatic conditions militated in more ways than one against the success of large numbers of the horticultural exhibitions held in the provinces, and in some cases heavy financial losses were inflicted upon the societies. In London the Royal Horticultural Society has not been less active than usual in fanning the flame of horticultural enthusiasm and in giving encouragement to those actively engaged in the scientific and practical sides of gardening. The interest and attractions of the fortnightly meetings have been fully maintained, and the exhibitions in the gardens of the Inner Temple and Holland House were of great excellence, the second of the two being the best the society has held in the beautiful grounds of this historic residence. Additional interest was given to the Holland House Show by the entertainment by the Council of the Japanese horticulturists and other of their copatriots associated with the Japan-British Exhibition at Shepherd's Bush. The Royal Botanic Society has not held any exhibitions on its own account during the past year, but its beautiful gardens have been the scene of several successful gatherings of horticulturists, and the Council have been successful in greatly reducing the debt that pressed heavily upon those responsible for the management of the society. The National Rose Society and the National Sweet Pea Society have both had a highly successful year; the two carnation societies have accomplished excellent work. The National Chrysanthemum Society has greatly improved its position, financially and otherwise, and the National Dahlia Society has held two excellent exhibitions, and obtained a considerable accession of members, which is of interest as indicating increased interest in its work. The National Vegetable Society, which was founded last year, commenced its work of usefulness in carrying out a series of trials of cabbages and onions which were highly satisfactory, and in the autumn held an exhibition that has been described, and properly so, as the finest exhibition of vegetables that has yet been held in this country. There has been no cessation of activity on the part of raisers and introducers of new plants and flowers, as evidenced by the large numbers of novelties submitted to the committees of the Royal Horticultural Society and other societies that make awards to new introductions. Of this number, we find, on referring to the "Gardening Year Book for 1911," which is a veritable storehouse of information on all that relates to the garden, that nearly three hundred had first-class certificates, awards of merit, or commendations conferred upon them during the twelve months over which the lists in the

MR. W. LINTOTT.

"Gardening Year Book" extend. Garden flowers predominate, and in these lists one hundred and twenty-four received distinction. All classes of flowers that are in general cultivation for garden decoration are represented, and, as might be expected, auriculas, carnations, chrysanthemums, dahlias, roses, and sweet peas are the most numerous. There are thirty dahlias, and these include varieties which, as in the case of Minerva, Hon. Mrs. Greville, and Sweet Briar, are specially adapted for the production of colour effects in the garden. Roses reach the large number of twenty-five, all, with one exception, home raised, and of these nine have been awarded the gold medal of the National Rose Society. The list of new orchids includes one hundred and eleven species, hybrids and varieties, and the most numerous are the cattleyas, of which there are twenty-five. While all are of interest and much value Cattleya Iris King Edward VII., C. Mendeli Stuart Low, and C. Mendeli Princess Victoria may be mentioned as of outstanding merit. Odontoglossums number eighteen, and of these Odontoglosum King George V., O. eximium Empress of India, and O. memoria King Edward VII. are prominent by reason of their distinctness and beauty. Laelio-cattleyas are represented by eleven fine forms, cypripediums by eleven, and odontiodas by eight forms, all of which are of great merit. The last-named are all of special interest, and, with reference to the hybrids previously introduced, it may be mentioned as a point of some importance that several were shown during the present year in a form suggesting that the earlier examples afforded an inadequate idea of their wondrous beauty. Although the lists of new plants, flowers, orchids, etc., form but one of the many features in the present issue of the "Gardening Year Book," they are well worth the cost of the work, for the purpose of reference and the evidence they give with regard to the trend of public taste in relation to the garden.

Mr. W. Lintott, whose portrait we have the pleasure of giving in this issue, occupies a prominent position among practical horticulturists, and deservedly so, for in all departments of the garden he has in the course of his activities given ample evidence of his cultural skill, and in garden management generally he has shown administrative ability of a high order. Especially have his skill and judgment been marked in the management of the gardens of Marden Park, Woldingham, the Surrey seat of Sir W. Greenwell, of which he has had charge during the past fourteen years. At an early period in his gardening career Mr. Lintott spent some time in the various departments of Dangstein, under the late Mr. Vair, at the time Lady Dorothy Neville was the owner. After leaving Dangstein and filling a minor position for a short time, Mr. Lintott was appointed head gardener at Shipwick House, Chichester, and remained there about six years, when the place was sold. Thence he went to Willand Place, Liphook, and on the sale of the estate some years later he was appointed to the position he now occupies. As made evident by the great success he has achieved, Mr. Lintott has taken a keen interest in the several branches of gardening, and he has given some attention to exhibiting. At one time he devoted special attention to Chinese primulas, and cultivated and exhibited them with much success, and then, as opportunities offered, ferns and stove plants have received special attention. Of recent years Mr. Lintott has taken special interest in fruit cultivation, both in the open and under glass, and it is probable that in this important branch of the gardening art he has the most highly distinguished himself. Mr. Lintott has been particularly successful as a grower of grapes, which is all the more interesting from the fact that there are no specially made vine borders at Marden Park. The finest bunches from a private garden of that debatable grape Prince of Wales which have come under our notice were grown at Marden Park.

"Gardeners' Magazine" Almanack, 1911.—With our next issue (January 7, 1911) we shall present a double-page almanack, at once handsome and useful, for 1911. The almanack will be embellished with an illustration printed in colours of the remarkably distinct and beautiful new rose Juliet, and it will give the dates of the exhibitions and meetings that have been arranged to be held during the year. As there is invariably a large demand for the annual issue containing our almanack we strongly advise those of our readers who require additional copies to give their orders at once, and thus avoid disappointment.

Intensive Potato Culture.—The reference in the "Journal" of the Irish Department of Agriculture to the fact that a second crop of potatoes had been planted at one of the centres has created some interest among potato growers, and the opinion has been freely expressed that the production of two crops of potatoes on the same land in one year is impracticable. In a general way it is so, but under the conditions favourable to this method of intensive cultivation it has been found both practicable and profitable. Some of the more enterprising of the Irish growers of potatoes have succeeded in obtaining two profitable crops from the same land in one season, but the first crop is grown for the supply of the market in the usual way, and the second for the production of immature potatoes for seed purposes. The method adopted is to plant first early varieties in March or April, according to the district and the condition of the soil, and lift the crop immediately it is ready for market, which will be some time in June, the date depending upon the district and season. Immediately the crop is marketed the ground is prepared for the second crop, which consists of late varieties. Pianting is done at the beginning of July, and by the end of October the tubers reach seed size, and are utilised in meeting the demand for immature tubers for planting purposes. Both the early and late tubers are sprouted previous to planting.

Holly was less plentiful in the markets than is customary during the week preceding Christmas Day, and prices ruled high in consequence. Berried holly, as might have been anticipated, was very scarce, and bundles of branches plentifully furnished with berries commanded about 40s. per bundle, instead of 8s. or 9s. per bundle, the prices ruling in years in which holly is well berried. Holly without berries sold at prices somewhat above the average.

Flowers and Berries from Leonardslee.—From the gardens of Leonardslee Mr. W. A. Cook sends us flowers gathered from the open of the brilliantly coloured Rhododendron Nobleanum, the delightfully fragrant Chimonanthus grandiflora, the elegant white Erica carnea alba, the purple Polygala chamæbuxus, the light yellow Jasminum nudiflorum, and primroses, polyanthuses, and Christmas roses. The sprays of Skimmia Fortunei and S. japonica which accompanied the flowers, are of special interest, as evidence of the value of these handsome shrubs when well berried for decorative purposes at this season of the year.

Presentation to Mr. E. Charlton.—On the occasion of the annual dinner of the Tunbridge Wells Chrysanthemum and Gardeners' Association, the members presented Mr. E.Charlton with a handsome marble clock as a mark of appreciation of the services he had rendered the society. Mr. S. Snashall, who made the presentation, spoke in highly appreciative terms of the services Mr. Charlton had rendered in the cause of horticulture, and of the help he had given the society of which he had been chairman two years.

The Peppermint Industry.—In a paper read at a recent meeting of the Pharmaceutical Society Mr. J. C. Umney, chairman of the chemical section of the London Chamber of Commerce, gave some interesting particulars of the cultivation of peppermint in England. He stated that in the Mitcham district the area devoted to the growth of peppermint cultivation is from 450 to 500 acres; considerable areas are also cultivated at Hitchin and Long Melford. The annual output of pure English oil of peppermint is about 10,000lb. This oil has a high reputation, and sells at three times the price of the best American oil. It has been suggested that the English oil is sometimes adulterated with the American oil, and Mr. Umney said that those dealing in mixed oils, to which misleading trade designations were attached, were doing much harm to the industry, and he appealed to those who are buyers of peppermint oil, whether it be for the making of confectionery, liqueurs, or for medicinal purposes, to insist upon having oil of undoubted purity.

La Societe Francaise d'Horticulture de Londres will hold its annual dinner on Saturday, January 21, 1911, at the Café Royal, 68, Regent's Street, London. M. Philippe de Vilmorin, who, on the last occasion, was prevented by the Paris floods from occupying the chair, will preside. Inquiries with reference to the dinner should be addressed to the president, Mr. G. Schneider, 17, Ifield Road, Fulham Road, S.W. The dinner is arranged for 6.30 p.m. precisely.

Arctic Plants from the Lea Valley.—In a letter to "Nature," Mr. S. Hazeldine Warren states that he has recently found a plant-bearing bed in the Low Level River-Drift of the Lea valley at Ponder's End. It is exposed in an excavation worked by the Great Eastern Railway Company. The plant-bearing bed is found at a depth of 14 to 18 feet below the surface. It is embedded in stratified gravel and sand, which presents much evidence of tumultuous accumulation. In immediate association with it are found tusks, teeth, and bones of the Elephas primigenius, Rhinoceros antiquitatis. In correlation with the archæological stages, the plant-bearing bed of Ponder's End is later than the Mousterien epoch. In fact, it is separated from this epoch by such a wide interval that it is in all probability post-Palæolithic. On the other hand, it is unquestionably pre-Neolithic, although the interval in this case appears to be comparatively short. It is in Mr. Warren's opinion by far the most important plant-bearing bed that has hitherto been found upon this horizon within the area occupied by Palæolithic man in this country. He is engaged upon working out the botanical material from this bed and submitting it to Mr. F. J. Lewis, who has undertaken its identification. A considerable amount of material has already been examined, and, so far, Mr. F. J. Lewis has succeeded in identifying ten species of plants, with four others doubtful. Three of this number, namely, Salix herbacea, Betula nana, and Sibbaldia procumbens, are distinctively Arctic, while most, if not all, of the remainder have a high northern range, although they are not confined to those regions.

Horticultural Education.—The report of the Conference on Rural Education has been published within the past few days, and from this we learn that it was recommended, amongst other things, that the staff of the educational authorities in rural districts should include a horticultural instructor, who should give courses of instruction at approved centres, carry out demonstrations on approved horticultural practice, give advice to small holders, allotment holders, cottagers, and others. He should have special charge of the work connected with school gardens and such nature study as may be connected with them.

Carnation R. F. Felton.—With reference to this beautiful perpetual-flowering variety which we had the pleasure of illustrating in our issue of the 24th inst., we would like to mention, as a matter of some interest, that Mr. H. Burnett was successful in winning the first prize in the class for a vase of flowers of a variety not in commerce with R. F. Felton at the recent exhibition of the Perpetual Carnation Society.

Eucryphia pinnatifolia.—As a difficulty is experienced in many gardens in growing this beautiful shrub so successfully as could be wished, the note relating to it which Mr. W. J. Bean contributes to the current issue of the "Kew Bulletin," is of much interest. Mr. Bean writes: Among the hardier small trees and shrubs from South America this is decidedly one of the most attractive, yet it still remains, although introduced about 1862, one of the rarest in gardens. For this scarcity one must find some other cause than lack of hardiness, for the original tree in the Coombe Wood Nursery has withstood uninjured the frosts of over 40 years, including those of February, 1895. For several years there was a group of plants in a bed on the lawn near the Cactus House at Kew which grew and flowered well until they were 4 or 5 feet high; they then commenced to die off one by one for no perceptible reason until none remained. Others planted in the collection of Rosaceæ near the Pagoda behaved in a similar way. It was thought that their early death might be due to intense summer heat and dryness, which appear to have a peculiarly burning effect on much of the outdoor exotic vegetation at Kew, especially that from regions where the climatic conditions are moist and equable. To counteract this in the case of the eucryphia, several plants were put out in a mass of Erica mediterranea, where the heaths grow close enough together to shade the soil and keep it permanently cool. In this position not one of the eucryphias has died, and the largest of them are now 8 feet high and in perfect health. Several flowered profusely last July and August—a season of blossoming which adds much to the garden value of any shrub, especially one whose beauty is as marked as that of this eucryphia. The soil is the ordinary sandy loam of Kew to which peat and decayed leaves have been added.

NOTES FROM HERE AND THERE.

There are a good many ways of getting a living in the horticultural world, and because a man is associated with the craft as a means of earning a livelihood it does not necessarily follow that he is a gardener. For instance, you may be on the road as a traveller representing a well-known firm, or you may be on the road in another sense, as were two fellows I met with the other day. This road by the way is one of Roman origin leading over the bleakest part of the Cotswold hills, and here I happened to overtake two men, one carrying a basket and the other having a couple of ferns in pots tucked under his arm. The ferns had a Covent garden look about them, and the ready and willing way in which the men entered into conversation with me indicated that they were not natives of the Cotswolds, but, on the other hand, their unmistakable Cockney dialect told plainly enough where they hailed from.

They were travellers all the same, their particular line being plants, ferns, palms, etc., grown in the big market nurseries round about London. Where were they going? Oh, all over the country, and chiefly to little towns where nurserymen and florists were not strongly represented. How long would they be away? Oh, they didn't know, perhaps six months, but much depended on business. How did they manage about the supply of plants? Had them sent on by rail to the different towns on the line of march, where they met the consignments, hawked the plants round, and moved on somewhere else. The men themselves, however, did most of their journeys on foot to save railway expenses, and when I met them they were getting towards the end of a tramp of 20 odd miles to a town where they expected to meet a consignment of plants. They seemed cheerful and happy enough, and explained to me that they had just done a deal in the way of exchanging at a wayside inn a couple of ferns for a meal of bread and cheese and beer, and, if the pelting rain was uncomfortable, it was better than snow.

This little incident, trifling in its way, goes to show how horticultural wares are distributed, and what cheap glass and keen competition have done and are doing in the market nursery trade. The men had started on their long tramp with as many plants as they could conveniently carry to sell on their way, and, with the exception of one or two, they had disposed of the specimens at houses they had passed. Looking at them with a gardener's eye, I admired the well-grown healthy-looking plants in their 5in. pots, and in an amateurish way, I asked what they were, but the only information I could get was that they were ferns. That was all the Cockney hawker knew about them, but he had got an eye to business, and before we had proceeded far he offered me the two remaining specimens at a price which he assured me was absolutely dirt cheap. It certainly was, and I marvelled how such plants could be grown and sold more than a hundred miles away from London at such a figure, considering also that the hawkers had got to live and pay expenses out of their profits.

Still another traveller, but this one had none of the free and easy style of the itinerant Cockney plant hawker. He carried a little parcel wrapped in American cloth, the elbows of his coat looked shiny, and his trousers were frayed at the bottoms. His boots were patched, but, in spite of these little drawbacks, he did his best to look smart, and he contrived to reach the bothy just when the dinner hour was half-way through, which, by the way, is a peculiar habit of men of his class. Perhaps you have guessed by now that the individual referred to was a book canvasser, and his parcel wrapped in American cloth contained a specimen copy of the first volume of a book on gardening that was being published in parts. His flow of language was marvellous, his knowledge of horticulture supreme, and, in the most solemn tones he warned the young gardeners round the table that they could never hope to rise in their profession without the knowledge contained in the book he had to sell. At first the young fellows didn't want the book, then they were persuaded to have a look at it, which ended in one giving an order for it, and before the dinner hour was up half a dozen young journeymen, who were not very highly paid, had undertaken to find so much a month for a good long time to come in order to become possessors of the latest comprehensive work on gardening.

Under the climatic conditions prevailing at present fruit planters who are disposed to carry out the Woburn process of puddling in the trees need have no difficulty in doing it, as there is moisture enough in the soil to enable one to puddle or ram it round the roots in the most approved Woburn style. Speaking of fruit planting reminds me that I met a man the other day who is in a bit of a difficulty. He wanted to plant an orchard, and his particular pet book on fruit culture told him to get out the holes for the trees a few weeks before planting, so that the soil could get weathered a bit. The advice seemed reasonable, so the holes were got out, and when the last one was finished it began to rain. As a matter of fact, it has rained ever since, the holes stand full of water, and the trees are laid in under the hedge waiting for the water to recede. The man is wondering what the holes will be like when the moisture has drained away and when he will be able to plant the trees. To use a parliamentary expression, he must wait and see, but he has come to the conclusion that in this climate the best plan is to dig the hole and plant the tree straight away.

The interesting exhibit of cider apples which appeared at the recent Colonial fruit show reminds one that the National Fruit and Cider Institute, Long Ashton, near Bristol, from whence came the fruit referred to, is doing in a quiet way a useful work in the interests of fruit culture and cider making. The institute has been established only a few years, but it is regarded in the West of England as a centre of information in matters referring to cider, and it possesses great possibilities for future development. For centuries past cider has been the national beverage of the West Country, but until the institute was established very little was done in propagating cider fruit and classifying varieties suited to this purpose. A part of the work has been to collect useful cider apples from different localities and propagate them, with the result that hundreds of standard trees have been raised at Long Ashton, and distributed in the contributing counties for the purpose of establishing cider orchards. In this way, it can safely be said that more orchards devoted entirely to cider apples have been planted in the West of England since the institute was established than for very many years before. All these orchards are planted systematically, and contain varieties that are sharp, sweet, and bitter sweet, so that by blending fruits of these a palatable cider will be produced. H.

AUBRIETIAS.

A note appearing in a recent issue of the Gardeners' Magazine, over the initials "G. B.," discusses the merits of Aubrietia Prichard's A1 in comparison with Aubrietia Dr. Mules. Having abundant opportunity for noting the peculiarities and virtues of rock plants in general, including a selection of the better aubrietias, I venture to give an opinion concerning these most useful subjects.

The variety Dr. Mules is far and away the most valuable of the two varieties in question for general planting. I grant that Prichard's A1 is large flowered, and that its habit of growth is particularly neat, certainly valued points for consideration. It is also effective when in blossom, but the flowering season is curtailed by reason of the blossoms opening almost together. In Dr. Mules the flowers are produced perpetually; there has hardly been a break since the earliest days of spring until autumn, and on November 18 last the plants on the rocks here were studded with blossom. This is not so with Prichard's A1: not a blossom has appeared upon it since the spring beauty was brought to a close by the appearance of the summer months.

So much for the flowering; now for the flowers. "G. B." describes Prichard's A1 as a much deeper violet. This is open to serious question; with me it is a two-coloured flower, lilac-purple and violet, the two distinct shades being very noticeable. Dr. Mules has a metalic hue, a living reddish tinge in the violet, though much depends upon the light or shade prevailing. The florist would doubtless describe Prichard's A1 as the more perfect flower on account of its rounded outline and well-arranged petals, but for rock garden effects give me Dr. Mules, with its fine colour and its perpetual habit of blossoming.

There are so many good aubrietias at the present day that one wonders that the older specific forms, A. græca, A. deltoidea, etc., should find a place in many gardens, though doubtless their continued vogue is due to the fact that they are still raised from seed in large numbers by hardy plant growers. A. Leichtlini, the red aubrietia, which drew so much attention a few years ago, has been superseded by better forms.

In the deeper shades the popular A. Fire King, and the attractive A. Crimson King are deserving of note, though for size of blossom and robust growth they are hardly equal to A. Alfred Wilcox, a fine rosy-red, which is becoming a favourite in south-country gardens.

Of the pink and rose shades I still like A. Souvenir de W. Ingram, which has a good habit, and is charmingly profuse, with its rosy blossoms. A. Moerheimi, too, is decidedly good, with its dwarf, close habit and large pink blossoms. Two paler favourites of mine are A. Bridesmaid, a pale pretty pink, a dainty shade of colour, and A. Lilac Queen, not quite so attractive in tone, but grand for its freedom, size, and continuity, and is, after Dr. Mules, one of the most perpetual forms.

Good forms amongst the purple and violet hues are becoming plentiful. A. Craven Gem, for instance, gives a lovely touch of colour, a rich deep purple, and another of the same class is A. Purple Robe, a good telling form. A. H. Marshall is valued for its lateness in coming into blossom, and for its deep hue, while the newer A. Lloyd Edwards is regarded by some as a coming violet variety of merit.

One could go on to discuss the merits of those favoured varieties, such as A. Hendersoni and A. Campbelli, which found their way into a host of gardens, and helped considerably to build up the present popularity of the aubrietia. A meritorious pale blue, named A. Lavender, should also be noted by lovers of these plants, as the best of its shade, and, in conclusion, I might note the advance of the quaint little A. tauricola alba, which is steadily pushing itself to the front, and which one day may assist in giving us a new race of white-flowered aubrietias. A white aubrietia has been noted under the name of A. Antilibani, which I have been unable to trace; from its name it would appear to be a Syrian form, and I should welcome a note concerning it from any reader who may happen to have it under notice.

Very few groups of rock plants can produce such telling effects as the aubrietias, and, whether massed upon the slopes of the rock garden, or streaming from the chinks of the rough stone walls, they are a very glory during the days of spring and early summer. P. S. Hayward.

DINNER TABLE DECORATIONS.

In most large establishments this particular branch of decorating is an important matter, and necessitates the cultivation of a number of suitable flowers especially for the purpose. Formerly plants were largely used for table decorations, but with very few exceptions cut flowers are now chiefly in demand. The tasteful and harmonious decoration of a dinner table calls for some forethought and preparation. There are a number of points to be taken into consideration.

First of all, the tastes of employers must be respected, and, secondly, one must consider what receptacles are to be used, whether plain glass vases, solid silver, or silver-gilt, and what colour of flower will be shown to the best advantage in the receptacles chosen for a particular occasion. It is very important that the decorations are of such a nature as not to obstruct the view across the table. They should be arranged so that the guests can either see over or under them. Should the table be a small one, with, perhaps, only one central bowl and a few small glasses, it is better to be able to see overhead; but for a larger table, for twenty or thirty guests, a bold style will be more appropriate, and the decorations should be arranged to allow a line of vision under the main decorations. The large bowls, which are usually mounted on pedestals, are placed down the centre of the table, one between each chandelier, while the smaller ones are arranged down the sides at suitable distances apart.

Flowers are not easily arranged in a bowl without some artificial means of support; it is therefore a good plan to fill the bowls with sawdust, into which flower tubes are inserted. When this is done little difficulty will be experienced in completing the arrangement. Care must be taken, however, to fully hide these accessories by foliage.

A pretty effect, even when the table is a fairly large one, can be obtained by using plain specimen glasses with a taller one in the centre. The glasses should be dispersed in a somewhat irregular manner, so as to avoid straight lines, and in this form, if tastefully arranged, are frequently much admired.

It is preferable to confine the arrangement to one, or at the most two, colours, and in selecting these direct contrast or soft harmony should be aimed at, it being essential that the colours do not clash. Another point worthy of consideration is variety of arrangement; by this I mean that one should not always keep to the same style, but at convenient opportunities introduce some novel feature. Unless this is done one's employers will naturally think you have only one stereotyped form of decoration, and they will naturally tire of the sameness.

The choice of suitable flowers is a very wide one, and, of course, must be governed to a large extent by the time of year. Bright colours generally look well arranged in silver bowls, as the latter add to rather than rob them of their charms. Pink carnations arranged with their own foliage, and perhaps a little Asparagus Sprengeri or adiantum, make a handsome table. Avoid any evidence of stiffness in the arrangement, placing some of the blooms well down and letting others project out, so as to produce a light and pleasing effect.

Cyclamen flowers with their own foliage produce a really beautiful effect, and are usually much admired. When gathering these cut off the tips of the stems or they will not take up water, and soon fade in consequence. Roses always present a lovely appearance. Madame Abel Chatenay and La France are especial favourites for the purpose. Calanthes, arranged with Nephrolepis Piersoni and Asparagus Sprengeri, make a really handsome table; while Dendrobium phalænopsis and streptocarpus form another pleasing combination. Lily of the valley and red tulips furnish a very showy display, but even prettier results are obtained by using Salvia splendens with the valley lily, the general effect being very light and charming. Begonia Turnford Hall and Euphorbia jacquinæflora are very effective when in conjunction. Gloire de Lorraine begonia is also useful for this class of decoration, the plants being turned out of the pots and fixed in the bowls. Few things equal smilax for tracery on the table cloth, and this should be arranged in an informal manner. Some decorators lay a few blooms on the cloth, but I prefer not to do this, as it has a tendency to detract from the main decorations, although, in isolated cases, this practice may be permissible. Very pretty effects can be produced with coloured foliage in autumn, and ampelopsis for tracery. These are a distinct break from the usual arrangement, and are frequently much admired. Poinsettias are often employed for Christmas decorations; when cut the stems should be plunged in hot water as a preventive of flagging. Holly leaves dropped on the cloth, with red berries stuck on the spines are a novel and pleasing feature, and with the poinsettias make a pleasing combination. J. Gardner.

French Beans.—As the New Year is close at hand the sunlight will soon increase, therefore ample sowings can now be made where a suitable structure is available; an even temperature is essential to success, one of 55 degrees, falling to 50 degrees at night, is suitable, though this must vary according to the outside temperature. Too much fire heat must be avoided, as it would seriously weaken the plants, and create red spider. The atmospheric moisture must be liberal, and the foliage of the beans syringed regularly about nine o'clock a.m. on fine days. Make sowings fortnightly in seven-inch pots, and be very sparing with water till germination takes place. To assist quick germination place the pots over the hot-water pipes, but remove them to their proper quarters so soon as the plants have broken through the soil. For varieties, Sutton's Forcing is excellent at this season, with Ne Plus Ultra for second sowings.—G. F.

THE MAGNOLIAS.

Amongst deciduous trees the magnolias stand out conspicuously, both on account of the great beauty of the flowers and the free-flowering propensities of many of the species. Several species, such as M. conspicua, M. stellata, and M. obovata, with a number of hybrids, of which M. Soulangeana is a worthy representative, are familiar objects to visitors to Kew, where each recurring spring they are laden with blossoms. The genus contains about 30 species, but several are not in cultivation, and some of those which have been introduced are not hardy, or are only suitable for culture in the more favoured parts of the country. The cultivated species have been introduced from China, Japan, the Himalaya, and the southern United States. Both evergreen and deciduous species are included, and the foliage in many instances is large and handsome. The fruits of some kinds are ornamental, particularly those of M. tripetala, which are about three inches long and one to two inches through, reddish in colour, and containing orange-coloured seeds.

In places where the climate is not suitable for open border culture, they may be planted against south or west walls, and in such positions they usually give very good results. They thrive best in moderately moist soil in a position sheltered from cutting winds, and, though not absolutely essential, they appreciate a little peat about the roots.

Transplanting is attended with some considerable risk, especially if the plants have occupied a certain position for any great length of time, and have formed a number of long roots with few fibres, for damaged roots frequently die back instead of healing. The best time to transplant, providing large balls of soil cannot be moved attached to the roots, is April, for then new roots quickly form, whereas if the work were done in January the roots would lie dormant in cold ground for a considerable period.

Propagation is a somewhat slow process. Some kinds may be raised from seeds, but seeds do not retain their vitality for a very long period, so they ought to be sown soon after they are ripe. Grafting is resorted to in the case of the conspicua varieties or hybrids, and also with stellata, whilst the large-leaved evergreen grandiflora is usually increased by means of layers, which may be put down in March, and be left two years without disturbance. The rooted branches should then be taken off and potted, and placed in a close moist greenhouse until well established. Very little pruning, except in the case of specimens trained to walls, is necessary, but what has to be done should be done in spring or early in summer, taking care to make clean cuts and protect the wounded ends of branches with tar as soon as the work is accomplished. Within the last few years magnolias have become very popular for forcing. For this purpose the most suitable kinds are the conspicua hybrids and M. stellata. Plants may be cultivated in pots and forced slowly into bloom for the beginning of March. If due care is taken with the forcing and after-treatment, they may be used for several years, and afterwards be planted in an open border. If, however, they are forced rapidly, and given no special attention afterwards, they will not be of service for the following year.

Appended are short descriptions of a few of the most suitable magnolias for beautifying the garden, and I hope to refer to the remainder of those of special value in an early issue. The more tender sorts which are suitable for the south and south-west counties only are referred to in the descriptions.

M. acuminata.—This is a native of the United States, and is known by the common names of "Cucumber Tree" and Mountain Magnolia. It grows to a large size in England, attaining a height of 40 to 50 feet. In America, however, it is found up to 90 feet in height. The leaves are large and ornamental, but the flowers are less conspicuous than those of other species, being small and green. The fruits are rather curious, and during their development bear some resemblance to small fruits of cucumbers. A variety is known called cordata, which differs from the type by its dwarfer habit and yellowish flowers.

M. Campbelli.—This species hails from the eastern Himalaya, and is a gorgeous flowered species. The blossoms are very large, six to nine inches in diameter, and bright rosy-pink, but unfortunately they are rarely seen, for the tree can only be grown in the south and south-west counties. Fine examples are, however, met with here and there, notable specimens being in the gardens at Fota, Abbotsbury, in Dorsetshire, and Leonardslee, in Sussex. After many trials a young plant has been induced to grow out-of-doors at Kew, where it is making satisfactory progress. Under natural conditions it assumes the proportions of a good-sized tree, and the Abbotsbury example must be between 30 and 40 feet high. The flowers usually open as the leaves begin to expand.

M. conspicua.—This is frequently called the Yulan in gardens, and it is one of the most beautiful of all the spring-flowering kinds when covered with its large white blossoms during April. It is found in China and Japan, and was introduced to English gardens about 130 years ago. A number of fine examples exist in the vicinity of the Metropolis, notably those at

MAGNOLIA LENNEI.
A handsome free-flowering hybrid, producing large rose-purple flowers.

Syon, Gunnersbury Park, and Kew, whilst a few years ago a nice tree grew in the grounds at Wimbledon House, Wimbledon. Under favourable conditions it attains a height of 25 or 30 feet, with a considerable spread. It is stated to have been cultivated by both the Chinese and Japanese from a very early period, and is still extremely popular. From it, crossed with M. obovata, a number of showy hybrids have originated, which differ chiefly from M. conspicua in the flowers being more or less heavily shaded with purple. Good ones are Alexandrina, superba, spectabilis, Soulangea, and rustica. M. Lennei is also said to be a hybrid of the same parentage, but the history of its origin appears to be lost. It has been stated to have appeared as a natural hybrid in Italy, and the above parents are simply suppositious. From its extremely large, highly-coloured, shapely flowers, there is every possibility that M. Campbelli, instead of M. obovata, was one of its parents. It is, however, much hardier than M. Campbelli, will grow wherever M. conspicua thrives, and is so beautiful that it should have a place in all gardens where the conditions are favourable to the development of the Yulan.

ESPALIER PEAR TREES AND PEAR ARCH, FULSHAW HALL.

M. Delavayi is a new species from Yunnan, with large, handsome evergreen foliage. It flowered for the first time in England in 1909, flowers appearing simultaneously in the Coombe Wood Nursery of Messrs. Veitch, and in the Himalayan House at Kew. The flower is deep cream or buff in colour, but less showy than many of the other species. It would not appear to be suitable for outdoor culture, except in the more favoured parts of Cornwall, Ireland, etc., for near London in comparatively mild winters it has been very badly cut whilst growing against a wall.

M. Fraseri.—This is an ornamental deciduous-leaved species from the Southern United States. Under natural conditions it forms a tree 40 or 50 feet high, but it is of smaller dimensions in England. The oblong or obovate leaves are up to 12 inches in length and 5 to 6 inches across. The flowers appear during June and July. They are cream in colour, and 4 to 6 inches across. It will succeed in the Midland counties, but is an uncommon tree.

M. glauca is known in the United States as the "Laurel Magnolia" on account of its small laurel-like leaves. It is widely distributed, and while it is deciduous in the Northern States it is quite evergreen in southern localities. This feature may be noted in imported plants, for occasionally those raised from seeds ripened in northern places lose their leaves in autumn, while those raised from seeds ripened in the south are quite evergreen. Though it is found as a bush in England, it is reported from the milder parts of its native habitat as sometimes attaining a height of 70 feet, with a trunk 2 to 3 feet in diameter. The leaves are 4 to 5 inches long, oval, green above and silvery beneath. The flowers are 2 to 3 inches in diameter, globe-shaped, and cream in colour. They open during June and July.

HOW TO GROW SWEET PEAS.—"Sweet Peas and their Cultivation," by C. H. Curtis (Secretary of the National Sweet Pea Society), is a complete guide to the successful culture of sweet peas for home or exhibition. Price 1s. net, by post 1s. 2d. or bound in cloth 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THE SUMMER PRUNING OF TRAINED PEAR TREES.

It seems strange to find so many different opinions given as to the treatment of pear trees grown against walls, or as espaliers, etc. The advice given by many is that it is dangerous to summer prune "too early," but summer pruning, or pinching the young growing shoots of trained pear trees, is little understood, judging from the details generally given. It is frequently stated that in the early summer one should never pinch the shoots too early or the basal buds will push into growth, and it is further suggested that pinching should not take place before July or August. In my opinion, if the work is left till then it is too late for any practical good to result.

The summer pinching of pear trees, trained on walls, etc., should be carried out in May, or as soon as the growths have made five or six leaves. After this, at the apex of the shoots or spurs, a bud or two will push into growth, and these growths should be rubbed off when two to three inches long. If this be done no basal buds will move into growth, and the strength of the tree will go to the fruit buds for another year. There are many spur growths which never give fruit buds unless summer pinching is done.

Up to July the whole energy of trained pear trees is frequently allowed to run to waste unchecked, and root pruning has to be done the following autumn, and this makes a lot of labour, which is wholly unnecessary. All wall-trained pear trees would be specimens of perfection in fruit cropping if summer pruning was done in due time. All who doubt this statement should do their summer pruning in May, or at latest in June, and take notice of the results; no basal buds will move into growth, and as the apical buds grow the growths should be rubbed off.

Walled-in gardens are necessary for pear trees, but many of the walls are not high enough; if three to four feet of wire trellis is put on the top of the walls, the parts on the wirework will very rarely suffer from frost, and this method will be much cheaper than making the walls very high with solid brickwork. How can horizontal or fan-trained pear trees be expected to produce fruit buds when they are allowed to get into strong growth, and the roots are rank in proportion; when strong growths are cut back to a few buds in August and winter, the trees are not pruned, but barbered—it is like cutting a hedge back.

It has been often said that the proper summer pruning or pinching of our trained pear trees is a lot of extra labour; I think it the greatest saving of labour, for a man can manage a large number of trees in a day in May, when the shoots can be pinched with the finger and thumb. This kind of pinching, or summer pruning, is much practised by the French gardeners, who are the greatest pear growers, and when they attain such success by close summer manipulation in their warm climate, we, in our colder gardens, should go in for still closer pinching than they do, to induce the buds to mature earlier.

What are the necessary qualities of perfection in a pear tree? I think they are a well-trained, well-balanced, fruitful specimen, giving the greatest return from the least expenditure of labour, and these returns of the finest quality. Trained pear trees on walls can be converted from a fruitless into a fruitful condition in one year, or season, by summer pinching.

Fulshaw Hall Gardens, Wilmslow.

DEEP CULTIVATION.

It gave me much gratification to note, in your issue for December 17 (page 1,000), that my good friend, Mr. E. Molyneux, and I are agreed upon the value of deep cultivation, especially in relation to vegetable culture, and the thanks of all true vegetable enthusiasts are due to you for your leading article on the same at such an opportune moment. The precise way, and the various methods adopted, for creating a depth of good compost, have always given rise to much difference of opinion, and probably will continue to do so for some considerable time to come.

ESPALIER PEAR TREES IN BLOOM, FULSHAW HALL.

I observe that Mr. Molyneux specially mentions the plot of ground rising three feet higher than the surroundings. A biggish jump that! Of course, he has seen it, or he would not say so. To make quite sure I have just measured ours whereon onions have been grown for between twenty and thirty years, and I find it exactly fifteen inches higher than the outside of a well worn gravel path. The value of raising the ground above the natural level on our wet, cold clay is fully demonstrated by the results obtained. This applies, not only to the quarters devoted to vegetable culture, but to shrubbery beds, rose and flower beds, specimen ornamental trees, as well as fruit trees.

With regard to the crucial point in relation to trenching and bringing the subsoil to the surface, I have said before in these pages that the more ungenial this is the more need for reformation. Mr. Molyneux says none of the advocates of the latter method have as yet given any practical common-sense reason for so treating soil. They, he observes, tell us to do so, and leave pupils to work out their own salvation. Now, my contention is, and always has been, that ground intended as a vegetable garden, generally speaking, is meant to be cultivated as such for many years, probably centuries. Consequently, thorough measures should be taken to convert the soil to the depth of at least three feet into an amenable condition as speedily as possible. No amount of tinkering with the subsoil at a depth of two or three feet under the ground will accomplish this. I am prepared to say, and prove, that if the system which I advise is properly carried out the soil to a depth of three feet will be in a better condition at the end of five years than the method approved of by Mr. Molyneux is at the end of thirty years or more, and the extra production will more than compensate for the expenditure.

I have had many letters, even during the past season, from amateurs and cottagers, not rich men, thanking me for my advice. They have carried it out to the letter, and with, they tell me, the greatest possible success, and there are several cases of labourers doing precisely the same thing in this locality. These are certainly most successful vegetable growers, and I can assure Mr. Molyneux that they do not cover the surface in such a way that plant life cannot possibly live on it. For fine seeds, and young seedlings, the smallest quantity of a fine porous material is frequently applied, and for deep root crops holes are frequently bored and filled with a suitable material, but this is practised whether trenching is carried out or not, in many places.

We do not waste a particle of garden refuse of any kind, but return everything to the ground. All that is of a woody nature is burnt or charred on the smother fire, and any other refuse is buried annually in the ground, as the trenching proceeds. I am, as most of my readers are aware, deeply interested in vegetable culture, and I have always advised conscientiously what I believe to be the right method and have practised myself. There are, I know, a large number of men, some good cultivators, too, who do not agree with me, but we have each only one object in view, and that is the best methods for bringing the soil speedily into a fertile condition.

E. Beckett.

Acalypha hispida.—Few stove plants have attracted as much attention when first introduced as did this acalypha, which was first shown under the name of A. Sanderiana. Although of very easy propagation and culture, and remarkably showy when at its best, it is not so often met with as one might expect. Why, it is difficult to say, for as a fine bold specimen, either trained to a single stem, or as a standard, the long crimson plush-like tails hang down for a considerable distance, and form a distinct feature.—W. T.

WELL-CROPPED ESPALIER PEAR TREES, FULSHAW HALL.

SCHIZOCODON SOLDANELLOIDES.

This lovely plant may well be called the Japanese soldanella, so much does it resemble in its loveliness the soldanella of the European Alps, although, unfortunately, its culture is not so easy as is that of the little flower which pierces so gracefully through the snow of its native mountains. To know it is to love it, and to induce one to have the keenest desire to number it among one's most cherished alpines, so exquisite are its beautifully tinted leaves and its delicately coloured fringed bells, of the most perfect form. If we scan the lists of Japanese dealers in plants we see it quoted at what appears an absurdly low price, compared to that stated in the catalogues of British nurserymen who offer this schizocodon, but we have not long embarked upon its cultivation ere we learn doubtless at some cost—that there is a potent reason behind the apparently exorbitant price at which it is sold in this country. One of our best writers on alpine flowers tells us of his ordering hundreds of plants after seeing the species on the streets of Tokio, where it was exposed for sale in magnificent condition. They were duly delivered at a cost of twopence each in Japan. But, we are told, the summer heats of Yokohama were too much for this stock of the schizocodon, and "they all sickened and expired." This is only a common experience, if we except the totality of the loss, which is not generally so great, although a big percentage of the plants expire, either before they are shipped, on the voyage, or after their arrival in this country.

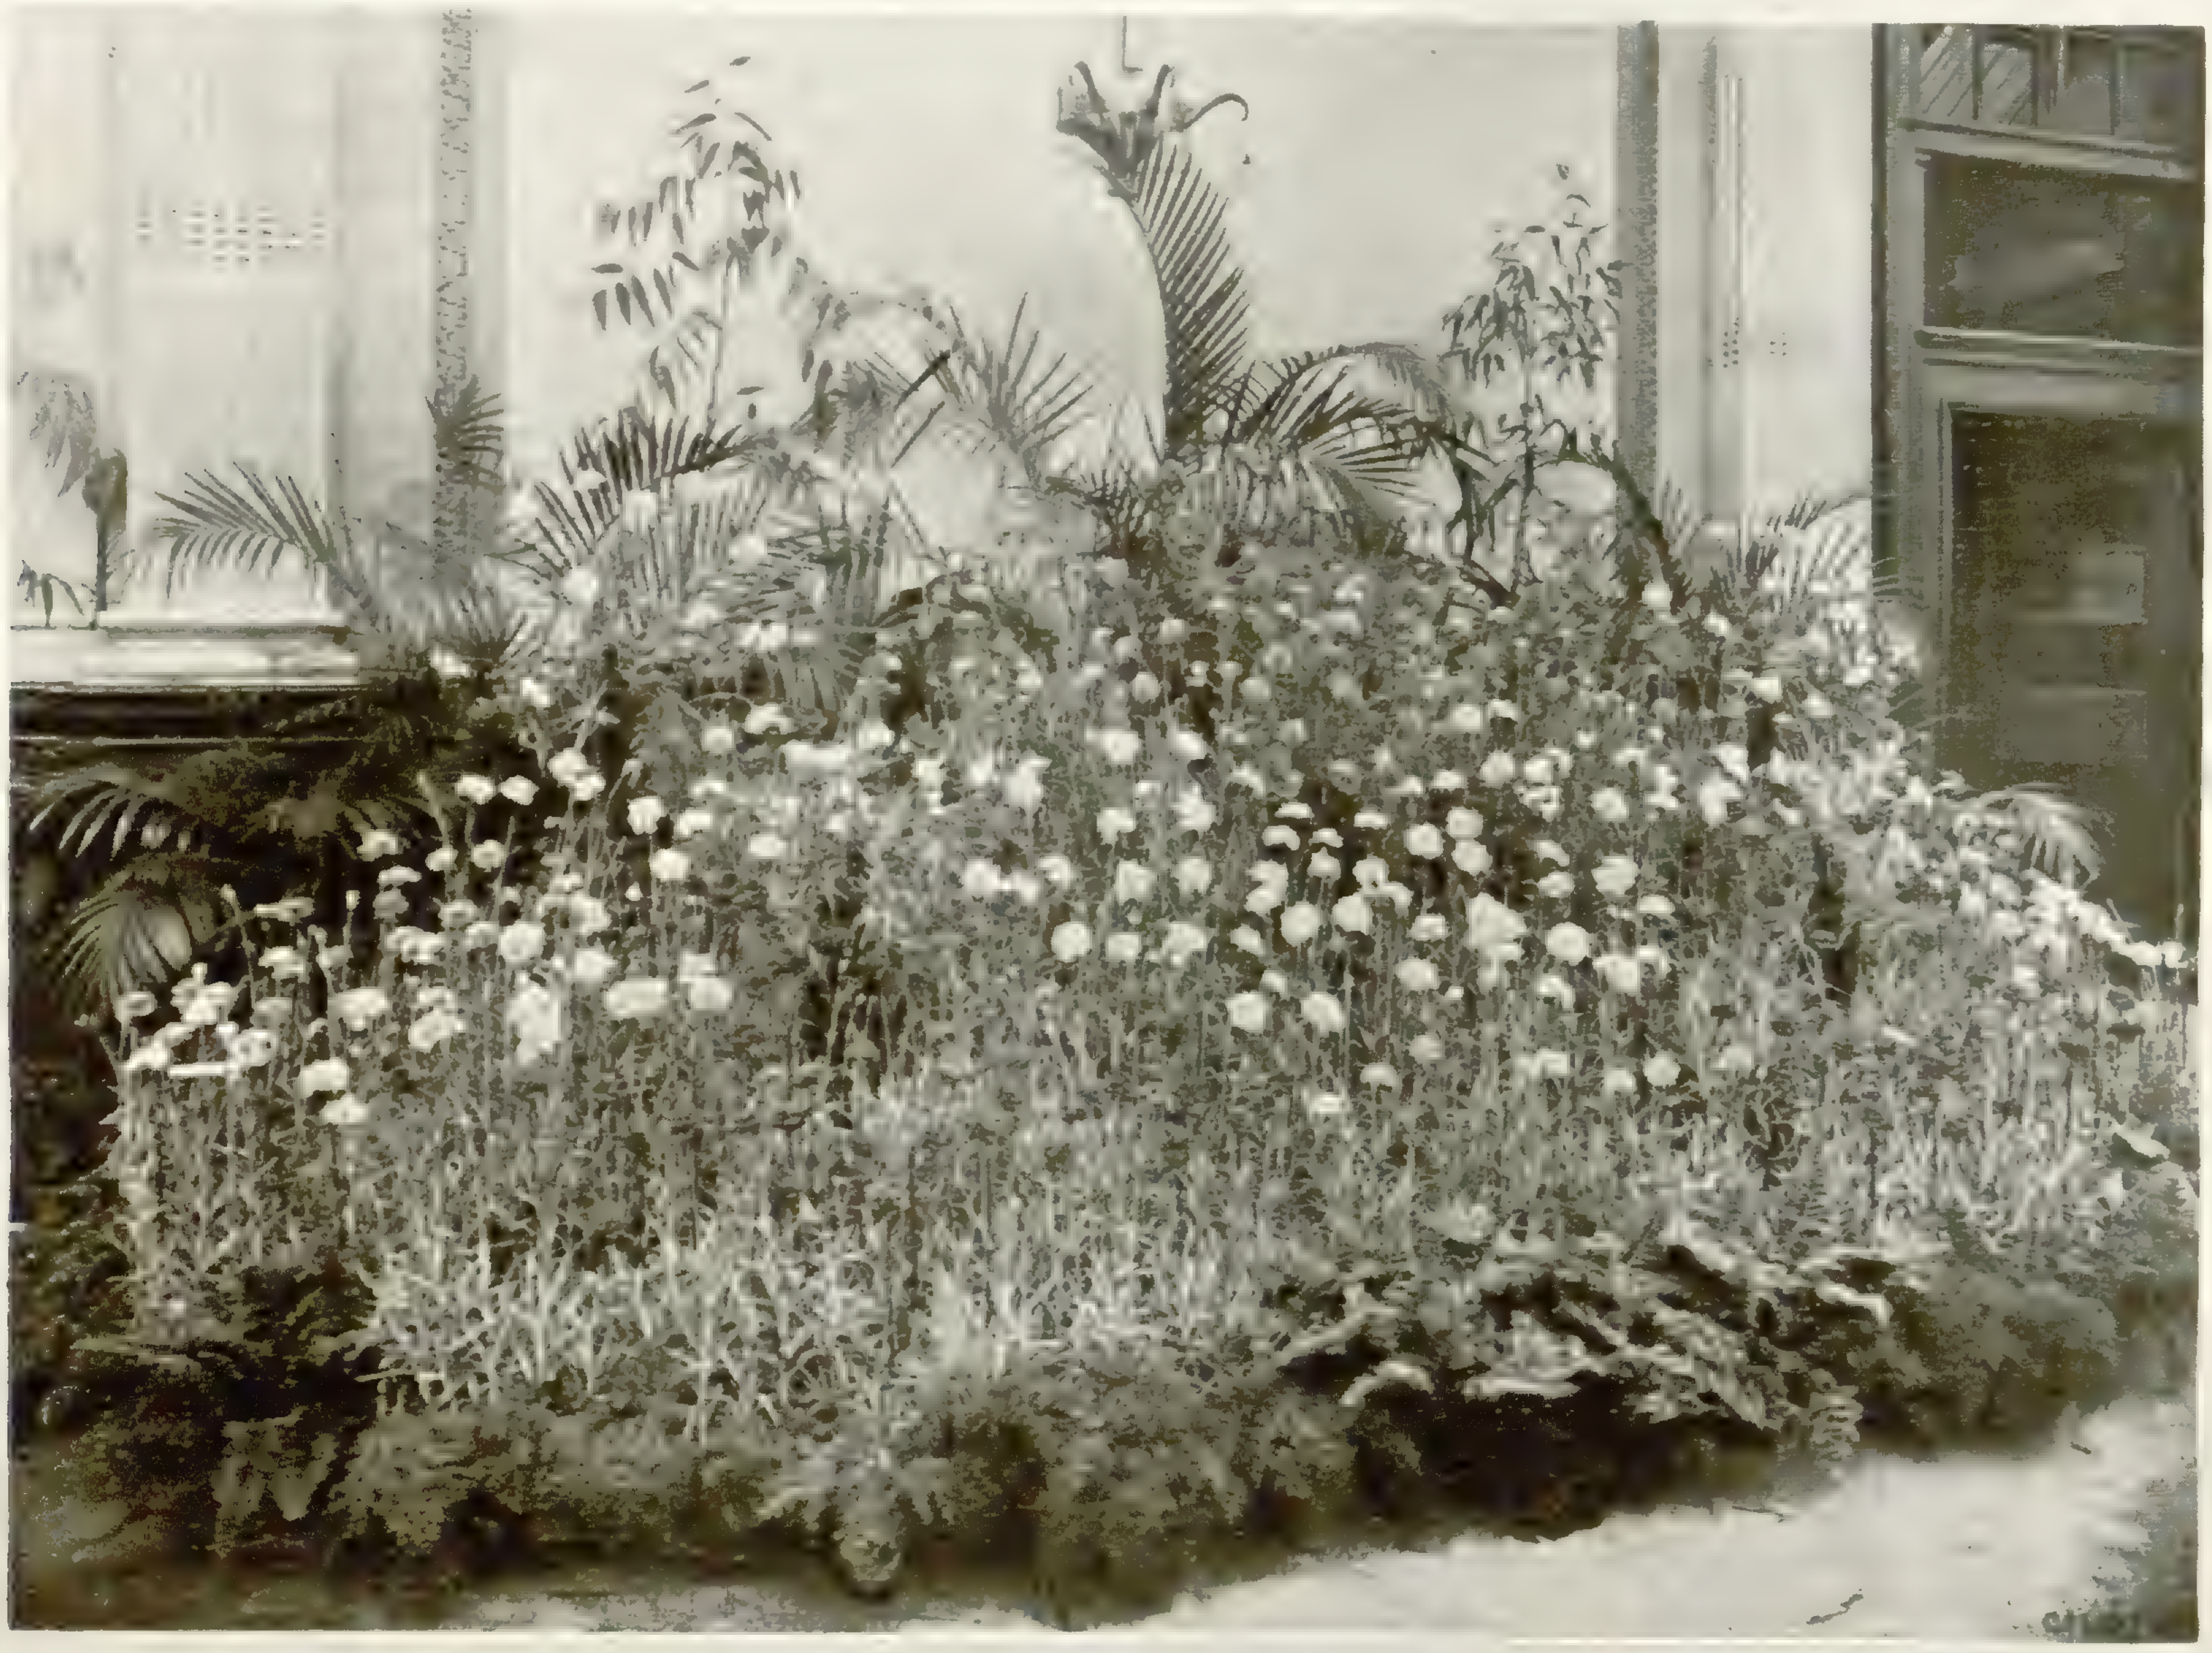
Newly-imported plants are certain to bring with them troubles of their own, however carefully they are treated, and one cannot wonder when we find this plant, costing only a few pence in Japan, appearing in our catalogues at half-a-crown each. To the uninitiated this seems extortionate, but to those who have had experience it appears no more than a fair return for the losses and trouble experienced in importing and establishing this lovely plant. To sum up, it is advisable to purchase those which are established, rather than to buy such as have been newly imported, or to send direct for a lot of them. It is not worth the annoyance and grief caused by the certain losses, for the amateur, unless he is prepared to run the risk on a large scale, to import this schizocodon, so we may advise the purchase of well-established examples in pots, and then turning these out with as little disturbance as possible.

Some think differently, but, to my mind, the schizocodon loves a cool, moist position, well shaded from the forenoon, midday, and early afternoon sun, and in peat, sand, a little grit, and a very little loam, with plenteous waterings with pure water in dry weather. Under these conditions we are almost certain to be able to realise the enjoyment of the exquisite rounded leaves, of tints too elusive to describe through the utilitarian methods of type, and requiring a water-colour painting to do them justice. Chocolate is at most seasons the prevailing tint, but the gradations are impossible to describe. Then the dainty, drooping, fringed, bell-shaped flowers, poised on little stalks, some six, nine, or so inches high, are beyond sober description. They are of a kind of rose-pink, exquisitely tinted with crimson, while the whole aspect of the plant is withal so fascinating that we can linger for long beside it to study its beauty and its charms. We have many lovely flowers from Japan, but there are none which in so little bulk convey such impressions of grace and beauty as this charming schizocodon.

S. Arnott.

A FINE GROUP OF PERPETUAL CARNATIONS.

One of the most interesting displays at the recent exhibition of the Perpetual Flowering Carnation Society was one composed very largely of plants in pots, and arranged by Mr. A. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, Shenley. The plants, staged with a few ferns and palms, were admirably grown, and all carried their quota of good blooms, thus demonstrating in a remarkable manner the value of these carnations for winter flowering, and their capabilities under careful cultivation. The varieties largely represented were Enchantress, Britannia, Harlowarden, May Day, White Perfection, Marmion, Mikado, Winsor, and Beacon, and all of these showed that Mr. Grubb is successful with a fairly large range of varieties. A few stands of cut blooms were arranged amid the plants, and rose above them, thus adding to the grace and effectiveness of the exhibit. Such a group as this does more than all the beautiful flowers staged by the market growers to extend the culture of winter-flowering carnations among amateurs. Mr. Grubb was deservely awarded a gold medal for this large and attractive group.



GOLD MEDAL GROUP OF PERPETUAL CARNATIONS.

Exhibited by Mr. Grubb, gardener to C. F. Raphael, Esq., Porters' Park, Shenley, at the Winter Show of the Perpetual Flowering Carnation Society, held at the R.H.S. Hall, on December 10.

SCREENS OF RAMBLING ROSES.

Rambling roses may be used in a diversity of forms in beautifying the garden, and providing the position is not overhung by the branches of large trees, and care is taken to well prepare the soil previous to planting, it is doubtful whether there is any form of training in which they will not present an attractive feature. There is no occasion to enumerate the various methods of training roses of a rambling character, especially as the object of this note, and its accompanying illustration, is to direct attention to the facility with which charming screens can be formed with their aid in a manner that is not generally known. The usual method in forming screens with roses is to provide a trellis of formally arranged or rustic woodwork, and such trellises when in suitable positions, and well clothed with roses, are highly attractive. Trellises are not required, or, indeed, desirable, in many positions, as in the one illustrated, and it, therefore, becomes a matter of some importance to know that excellent screens of roses may be formed with such simple supports as stout poles. The screen depicted occupies a position at one end of the long grass walk that intersects the magnificent herbaceous borders which form so glorious a feature of the Welbeck Gardens. Beyond the borders, and the intersecting breadth of turf, is a belt of trees and shrubs; and in front of this is a raised border and a gravel walk. The raised border, as will be seen, is planted with Dorothy Perkins roses, and the growth of these is supported by stout poles that stand about eight feet above the ground level. The poles are about thirty inches apart, and as the roses have grown vigorously, and in their season bloom profusely, they form a most perfect screen, that is remarkably attractive from the development of the leaves in the spring until their fall late in the autumn. But when in the season of roses the bright glistening foliage is supplemented by myriads of clusters of the bright pink blooms, the effect is truly delightful, and the rich display of colour arrests attention long before the screen is reached. At Welbeck the screen forms an admirable finish to the long vista of flowers and foliage formed by the unique herbaceous borders.

Within the past two or three years Mr. J. Burton, the able superintendent of the Leicester public parks and gardens, has formed a similar screen in the Abbey Park, and, as at Welbeck, it is a great success. Facing the flower-clad slopes around the refreshment pavilion near the centre of the park there is a group of flower beds, with a plantation of trees and shrubs at the back. In front of this is a broad border which previously was wholly devoted to flowering plants of robust habit, and at the back of this Mr. Burton planted Dorothy Perkins, and supported it with stout poles eight feet or so in height. The roses have now clothed their supports from base to apex, and bloom so freely that at the height of the season the screen may, without any stretch of imagination, be described as a cascade of flowers. The only points to which there is occasion to specially refer are the importance of liberally manuring and deep digging the border before the roses are planted, and of providing poles of sufficient strength to support the growth without the risk of them becoming unsteady in a gale of wind.

A BEAUTIFUL SCREEN FORMED WITH DOROTHY PERKINS ROSE

In the gardens of Welbeck Abbey.

NOTES FROM FROGMORE.

A visit to the Royal gardens of Windsor, especially to the glass department, situate at Frogmore, is at all times interesting, as gardening there is carried on of a high order of merit.

Many persons would suppose the middle of December is not an ideal period to visit any garden, but I can assure readers that in establishments like this there is much to interest and much to learn from the present displays of various subjects and from the preparations in hand for the future. Recently I paid a hurried visit to Frogmore, and greatly enjoyed what I saw under the guidance of Mr. Mackellar, who is an organiser of great things, as must be the chief of this establishment.

The plant houses were especially bright with plants used for the decoration of the castle, and it may be of interest to mention that the plan is to arrange the groups of plants first in the houses at Frogmore for the positions and rooms they are to occupy, as there is then less trouble in producing the exact effect desired. I would not like to say how many van loads of plants are required when the King is in residence, be they few or many the resources are adequate. Of chrysanthemums huge quantities are grown both for large blooms and the smaller decorative types.

It would be difficult to find an equal display of Gloire de Lorraine begonias, one house alone containing 1,000 plants, the bulk of them specimens, many measuring a yard across, nearly as much high, and smothered with blooms from base to apex. The plants are arranged to form a bank on either side of the house, the front row standing on the floor and the others on stages. The roof is draped with the growth and flowers of suspended plants, making a complete avenue some 100 feet long. At the end is a huge mirror, which is so adjusted as to produce an effect representing double the distance, with a gentle curve, quite a novelty in its gorgeous effect. One plant I specially noted was 4 feet in diameter and 3 feet high, which had been grown from a cutting that was rooted in January.

The anthurium house, even at this time of the year, was a fine sight, with the highly-coloured huge spathes, these being found of the utmost value for decoration. About two dozen varieties are grown, and the plants grow so vigorously under their happy conditions that it is found necessary to frequently lower them by surface rooting of the stems, thus reducing their height. The croton house, too, was especially attractive with its numerous varieties represented by brilliantly coloured plants of all sizes, from specimens in the centre to thumb pot plants on the side stages, all of which are found useful. Of palms, huge specimens are grown in quantity, and none are more highly appreciated than Kentia Belmoreana.

Naturally orchids are grown in quantity, Cattleya labiata and its many forms are distinctly rich in colour, and much appreciated at the dull season of the year. An especially fine batch of Dendrobium phalænopsis was noticeable, one spike having as many as twenty-three flowers. Calanthes are grown numerously, and a fine batch of C. Sanderiana, with bulbs twelve inches long gave promise of a rich display. Cypripediums are distinctly useful, and rich in variety.

Carnations are here, as elsewhere, much appreciated. Not a day passes but several dozen blossoms are cut; naturally then the collection is of the best. It would be difficult to find a healthier batch of plants of all sections, especially the Malmaison type. Poinsettias are grown in large numbers, the plants ranging from 2 feet to 7 feet high, with foliage quite to the pot. A capital way of treating smilax here is to plant it in a narrow border at the back of the vineries. The plants grow freely, producing just the trails required for decoration, at the same time covering the otherwise bare walls.

It is in the fruit department especially where much that is good in cultivation can be seen. If but more gardeners would follow on the lines here adopted in pruning and training, their vines and peach trees especially, we should see much more desirable results in various parts of the country. Take the vineries, for example. Mr. Mackellar is a staunch believer in space for the rods, allowing the leaves to develop fully, and thus obtain maturity in a natural manner. In many cases the single rods are 4 to 5 feet apart, and the leaves, wood, and bunches resulting prove the value of sufficient space. In starting with young vines several feet of growth are not retained, but they are pruned close back, and thus make strong growth. The extension system of filling a house with a limited number of vines is being gradually adopted, each vine will eventually have many branches radiating from its base to the right and left of the main stem.

Muscat of Alexandria is naturally a favourite, as also is Lady Hutt, which is destined to occupy much space; it is found to be so useful, keeping quite well until March, the high flavour being maintained throughout. Lady Downes is required in quantity, but the coarse varieties like Gros Colmar, Alnwick Seedling, and Alicante are not desired, although the latter is now carrying grand crops of serviceable bunches, gloriously finished, having that purple bloom so much admired by expert grape growers. E. M.

FRUIT ROOMS: STRUCTURAL FEATURES.

Important as is the store set apart for fruit in the garden, how often one finds structures very ill-adapted; and sometimes even quite make-shift accommodation comes under review. True, there are plenty of cases where the gardener has no option in the matter, he takes over the accommodation his predecessors have used before him, and very often serious thoughts are not raised in regard to the suitability or otherwise of the building for the purpose in question. The gardener expected to provide a supply of apples and pears over the longest possible season has often to adopt various schemes to enable him to do so with fruit in the best possible condition.

When the individual grower looks about him for an ideal his mind may find location in one of the large nurseries where fruit trees are extensively grown. These are independent open-air structures, span-roofed in design, heavily thatched both sides and roof, a provision that ensures uniformity of internal temperature. Very few gardeners, we repeat, can look upon these perfect designs and hope for the privilege of such adaptable appointments. A suite of offices usually finds a site behind one of the boundary walls of the garden almost invariably having a northern aspect. For fruit stores such a site may be claimed as the best under circumstances of this kind. Slate rather than thatch is the most commonly used. A straw or matchboard underlining would tend to neutralise the variable influences of unseasonable weather acting on slate roofing.

The shelves for laying the fruit on are often a debatable question, giving rise to differing opinions. While some stand by the open-strip trellising under the impression that a circulation of air passing through and among the fruit is best, others just as zealously regard close shelves lined with clean paper as superior for the purpose. Both advocates may satisfy themselves on these points by a comparative trial. What is often lacking in fruit stores is light and sufficient roof ventilation. Light is a matter of considerable convenience, when, after the gathering, sometimes hurriedly done, damaged fruits set up decay, and must be removed. A roof light should be provided with accompanying shutters that can be closed at other times.

We have recollection of a well-appointed fruit room in Dorset where for small lots of pears there was a series of easy-fitting drawers arranged beneath an open bench that served for packing or storing of other fruits. In this garden was a large and interesting collection of cordon pears and apples, and which did remarkably well thus grown, and, probably for the convenience of an interested employer, these drawers, arranged in small compartments, were designed. We do not remember to have met with a similar provision anywhere else, but an enquiry ascertained the fact that the drawers were highly approved and well adapted for keeping such fruit in good condition over a maximum length of season.

Another instance of local adaptation comes into mind where a disused and spacious underground water tank was fitted with shelves, and its conversion turned out to be a convenient and adaptable fruit store. Pears were kept in sound condition in this converted water tank; indeed, it was said to be much superior to the conventional fruit room. The uniformity of temperature found in ordinary cellarage was naturally the key to this unusual adaptation.

The ideal fruit room should be a span-roofed erection, with ample space for side shelves of convenient width, say, from 24 inches to 30 inches, and a central stage where samples of every kind in stock are set out under name. Such a provision is distinctly educative, because, when legibly written, or, better still, printed, labels are placed on each variety, form and character is made familiar to everyone having access to this utilitarian chamber. Provisions of this sort were in use in the Syon House gardens, also in the old Chiswick gardens of the R.H.S., where it became a mine of information to the student and visitor in turn.

The aridity of an upstair apartment has been proved too unsuited to late-keeping fruit; a ground floor apartment is much better, and presumably the ideal fruit room should have an open soil floor, from which moisture naturally rises and bedews the fruit in its fall. A ground floor room in a disused cottage is often found to be a capital store for late apples and pears, the upstairs rooms of the same building serving for fruit in daily use through the autumn and early winter months. W. Strugnell.

CONFERENCE PEAR.

I suppose Mr. Coomber, when writing his interesting note about this pear on page 975, did not have the "Journal" of the Royal Horticultural Society, Vol. IX., 1887, at hand to refer to, otherwise he would have seen on page 86 of this report of the Committee of the National Pear Conference, held in the society's gardens, Chiswick, October, 1885: "A new seedling variety raised by Mr. Rivers, named the Conference pear, ripening in October, was awarded a First Class Certificate as a market variety." The pear received its name to commemorate this award, the only one made at the conference. A seedling from Léon Le Clerc de Laval, it was distributed in 1892. Conference now has a definite place amongst the best dessert pears of its season, October and November, is very hardy and a constant bearer. Cropping even in such an adverse pear year as 1910 has proved, it is suitable for growing in all forms and in most localities.

Pears are kittle-cattle folk; it is impossible to say what they will be like to eat in any given season, nor exactly when they will ripen. Emile d'Heyst and Beurré Diel are excellent now, December 10, a somewhat late date for them. Beurré Fouqueray has been very good indeed this year. Le Lectier, sometimes extremely well flavoured, gritty and astringent.

Pears require more special care in storing, so that they shall ripen properly, than apples.

A dark shed, which will keep out the frost and maintain an even low temperature is all right for the latter, but pears should have very slight extra heat in their room, so that the temperature shall not fall near freezing point; some light, too, seems beneficial. H. Somers Rivers.

ZYGOPETALUM MACKAYI.

Eighty years have run their course since this handsome species was introduced to cultivation, and numerous as have been the species, hybrids, and varietal forms with which gardens have been enriched, not one can be mentioned as having superseded it. The two varieties, crinitum and intermedium, which, by some authorities have been given specific rank, are distinct and beautiful, but, as regards merit, they can hardly be described as differing appreciably from the type. Of great beauty is the variety known as crinitum cæruleum, which is remarkable for the expansion and brilliant colouring of its lip. This variety does not supersede the type, but it is so beautiful when well grown that one cannot well repress a feeling of regret that for some inexplicable reason it should have become so extremely rare that it is seldom met with, and commands a high price. Why it should have become scarce is to me difficult to understand, for at the time when I could give the attention to orchid cultivation that is not now possible, the half-dozen or more large specimens I had grew with quite as much vigour, and bloomed as freely as do the other varieties under precisely the same cultural conditions.

I was reminded of the attractions and usefulness of Zygopetalum Mackayi, and its varieties, by the large number of finely grown specimens of the type that were contributed by Mr. A. R. Allan, the able gardener at Hillingdon Court, to the meeting of the Royal Horticultural Society held on the 6th inst. Not having counted them, I cannot say how many plants there were, but they occupied a long run of table, and the forest of flower spikes that rose from them, produced a striking effect, and afforded an admirable object-lesson on the usefulness of the species in contributing to the attractions of the intermediate house during the winter months. A spike of flowers of one of the plants shown by Mr. Allan I have the pleasure of illustrating herewith, and as the spike was selected for the convenience of the photographer, rather than for its exceptional development, it will be readily understood that the plants had been grown with much success. The flowers are borne on spikes ranging from fifteen to twenty inches high, the sepals and petals are bright green, freely blotched with purple-brown, and the lip white, marked with small blotches and radiating lines of purple.

Z. Mackayi and its varieties thrive under the same conditions, and these are simple and can be briefly stated. They will thrive in association with a mixed collection of stove plants, and, indeed, in a mixed collections of orchids, but in gardens in which there is a collection of orchids sufficiently extensive for the sections to be arranged according to their cultural requirements they should be grown in association with the cattleyas and lælias. As regards potting material, they succeed best in tough fibrous peat, broken up roughly, to which a few nodules of charcoal and small, perfectly clean crocks are added in the process of potting. The pots should be of moderate dimensions in proportion to the size of the plants, and be filled to about one-half their depth with crocks. G. G.

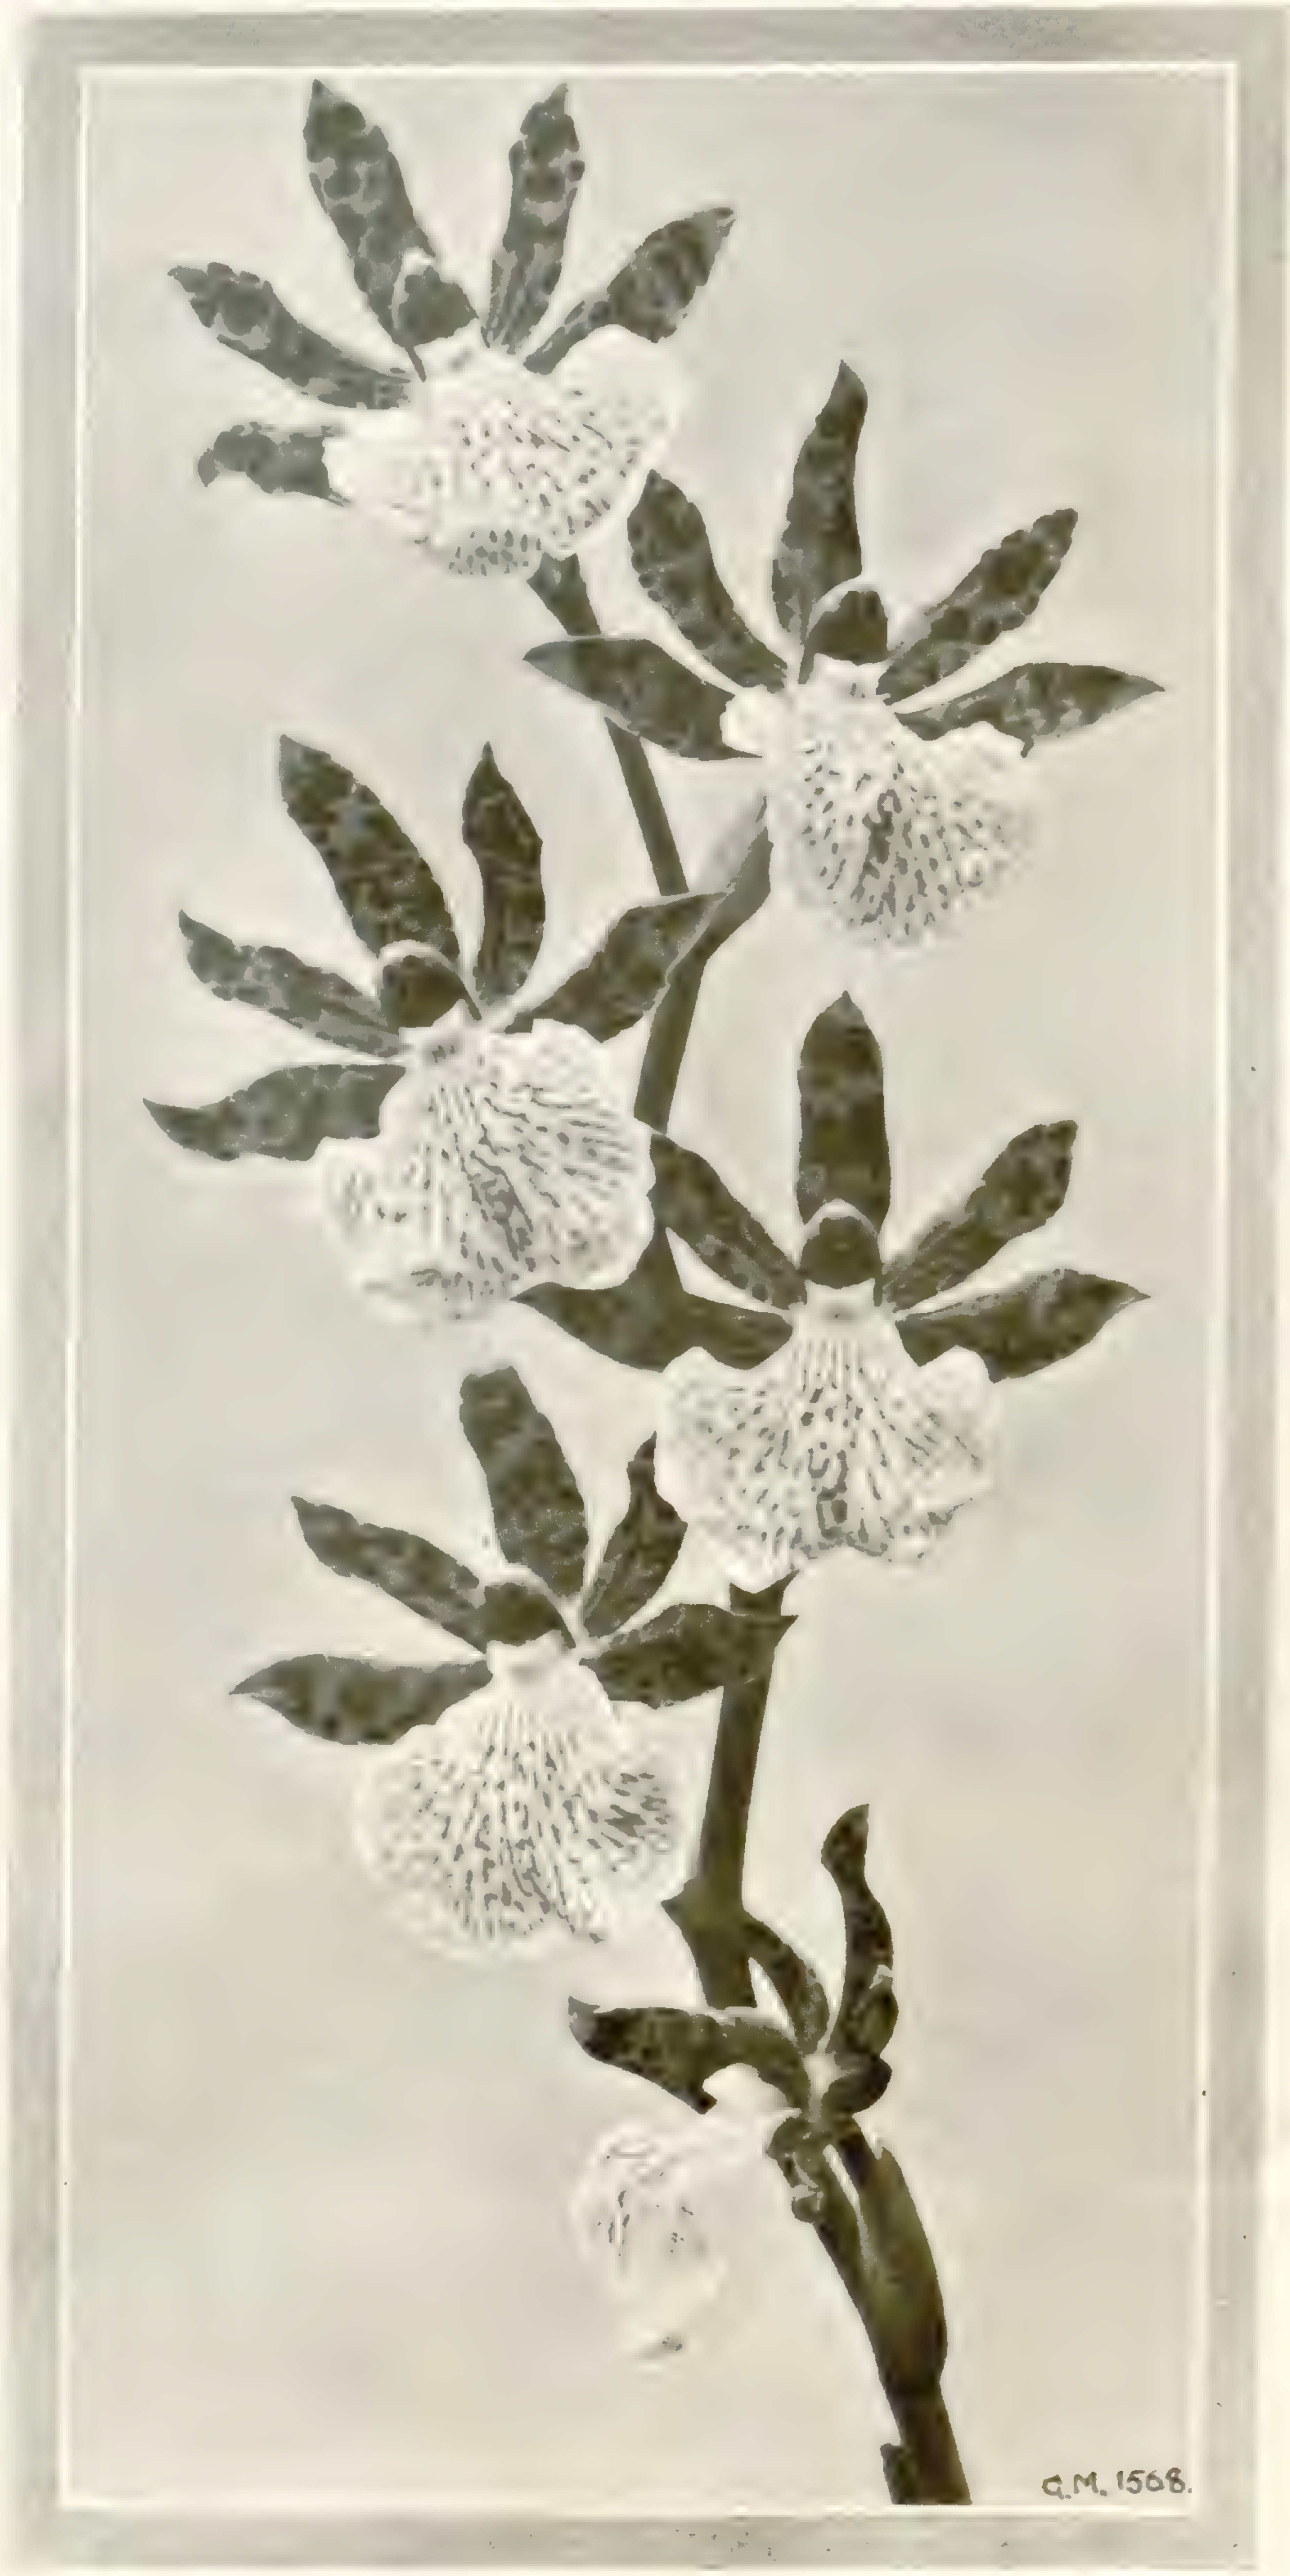
Tomatoes.—A sowing should now be made in a light sandy compost, using five-inch pots for the purpose. Just cover the seeds with the finer soil, water well in with tepid water, and place sheets of glass over the pots till germination takes place. A shelf in a house with a temperature of 60 degrees will be the most suitable.—G. E.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

COOL HOUSE ORCHIDS.—The bulk of the odontoglossums, both hybrids and species, are either in their most active stage of growth or are developing their flower scapes. I cannot help referring to the changes in the cultivation of odontoglossums in evidence to-day, compared with that in vogue only a few years ago. I had occasion to refer to a prominent book on orchid cultivation only a few days ago (a book that has been published well within my recollection). In this we were advised that the winter temperature for odontoglossums should be from 40 degrees to 45 degrees, and that with excessive cold weather, as long as the frost was excluded and the atmosphere of the house kept drier, the plants would take no ill-effects. Small wonder that with such conditions only small stunted pseudo-bulbs and growths were produced, little, if any, advance from one season to the next, or that no attempt was made to propagate from back bulbs, or the plants relieved of leafless ones, unless by chance they set up decay, and there was a possi-



ZYGOPETALUM MACKAYI.

A handsome species introduced to this country in 1826, and bearing flowers attractively coloured green, purple-brown, white, and purple.

bility of losing the plants altogether unless the rotting portions were cut away. Surely it should have been evident to prominent growers and writers of those days that the season when plants were in the most active stage of growth development was not a season to admit of their being exposed to an extremely low temperature. There can be no question but that the secret of the success obtained in recent years in the growing of odontoglossums has been the more liberal treatment. I have asked some of our most successful raisers of seedling odontoglossums to account for the successful raising and growing of plants from seed, which has become such a prominent feature during the last ten years, but I have never received what I consider a satisfactory explanation from any of them. To my mind, it appears that it is to the warmer conditions under which the plants are being grown during the winter and spring months that we may attribute this improvement. In my own experience I have found that the seedling odontoglossums do not make satisfactory progress unless they occupy a structure in which a normal temperature of 55 degrees is maintained during the winter months. In fact, for some years now we have maintained a night temperature in all the odontoglossum houses of 53 degrees. Unless we have extremely cold conditions outside I consider it inadvisable to permit the temperature to fall below 50 degrees during the season that the plants are in their most active state of growth development. Many of the plants will be emitting their flower scapes, and careful observation is necessary to guard against their being damaged by slugs and snails. It is a good plan to place little patches of bran about the stages, and on the surface of the potting compost where any traces of these pests are found, or to hollow out some pieces of potatoes, and, with the aid of a lamp they may be caught and destroyed. Some cotton wool wrapped around the spikes in such a manner as to render it difficult for them to climb up the stem will, to some extent, protect the flower buds but the only safe remedy is to catch and destroy these pests.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

DECORATIVE PLANTS.—At many of the country houses it is the custom to entertain very largely at Christmas, and many batches of plants will have been held in reserve for this occasion, but now that the greater part of these festivities are over many of the plants will have fulfilled their mission of usefulness, either by being used as pot plants for the decoration of the house, or as cut flowers for table decoration, etc. Much of the available house-room will be required for the introduction of plants for forcing, so that batches of poinsettias, euphorbias, Begonia Gloire de Lorraine and its varieties, justicias, etc., that may be cut down might with advantage be cut over to a reasonable degree, and stored fairly close together, giving the stock plants rather less water at the roots. This will give largely increased room in the houses, and batches of Azalea mollis, lilacs, lily of the valley, spiraeas, laburnums, etc., may be brought in. In many places these subjects are forwarded in early fruit houses, but where very early forcing of fruit is not practised it is quite necessary to put them into the stove or other warm structures to maintain a steady supply of flowers through the early spring months.

TULIPS AND NARCISSI may also be put into a house where the temperature does not rise much above 60 degrees, the narcissi being particularly apt to come blind if given an excess of heat.

BEGONIA GLOIRE DE LORRAINE.—If early batches of these are required good fleshy leaves should be taken off the plants as they are cut down, leaving about an inch of stem to each leaf, and pricking them into shallow pans filled with silver sand or sand and fibre. In some instances these leaves strike very readily, whilst at other times I have known them take from three to four months to become well rooted. If cuttings are preferred, the plants, after being cut down, should be given a rest for a month or six weeks in an intermediate house, after which they may be again introduced into the stove, where they will soon produce good fleshy shoots, which, if used as cuttings, will, in most cases, catch up to the plants raised from leaves.

BEGONIA GLOIRE DE SCEAUX.—This handsome foliaged begonia makes a fine decorative plant during the next two or three months, and when they are still in active growth they may be assisted with a little liquid manure, keeping the house in a fairly moist condition by damping between the plants, not overhead, as, where the water is at all limy, it marks the foliage badly. To keep down thrips a light fumigation should be given occasionally.

THYRSOCANTHUS RUTILANS. — This very pretty stove flowering plant will now be coming into bloom, and if assisted with a little liquid manure the plants produce long racemes of bloom. Unfortunately, it has a habit of dropping its lower leaves during the winter months, this often being caused by too close an atmosphere, or an excess of water at the roots. To prevent this a fairly light position should be chosen for them, keeping the soil only moderately moist till they begin to produce their flower spikes, when they may be given a little manure water as advised.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

MELONS.—Plants of a free setting early variety should be raised from seeds sown now for producing an early crop of fruit. Sow them singly in small pots filled with fine compost of loam and leaf-soil, and plunge the pots in a mild hotbed. When the plants appear place them near the glass in a pit possessed of a moderately moist atmosphere, and a night temperature of 65 to 70 degrees, with a slight rise by day. Keep them carefully supplied with tepid water, and early in the afternoon of fine days sprayed overhead. Once the plants are sufficiently rooted give them a shift into 4½ inch pots, and in doing so make use of warmed compost. Finally, when these pots are well filled with roots, either plant them out at two feet asunder upon well-firmed warm hillocks or ridges composed of moderately heavy loam, lightly mixed with fine mortar rubble and soot resting upon a warm bed, or shift them into fruiting pots. In either case train the plants as single cordons to a trellis.

CUCUMBERS.—If the artificial heat necessary to keep plants at this season of the year in a satisfactory bearing state should, as it is likely to do promote attacks of injurious insects, keep them in check by the careful use of the syringe, and by vaporising with a suitable compound. Until the days lengthen continue to very lightly crop the plants, and at all times gather the fruit as soon as it is fit for use, and keep decaying leaves removed. Give necessary attention to the application of light top dressings of fresh compost and to watering the plants. Seeds should now be sown in a similar manner to that advised for melons for raising plants to succeed the winter fruiters.

EARLY QUEEN PINEAPPLES.—The present time is suitable to start the plants that have been prepared for the purpose as has been advised in previous calendars. Those that were firmly plunged in suitable beds heated by hot-water pipes when they were shifted into their fruiting pots, should not need, as is sometimes expedient, to be replunged, but should this, from any reason, be required, it should be expeditiously done with as little as possible injury to the plants. For the next few weeks the night temperature of the house should, according to outside conditions, range from 65 to 70 degrees, and that by day from fire heat 10 degrees higher, with a rise from sun heat to 80 degrees before the house is ventilated. The bottom heat may range at about 85 degrees. Keep the atmosphere of the house moderately moist by damping the pathways, and on fine days spray with tepid water between the plants. The plants' roots having been kept while at rest tolerably dry, should be given a good watering with tepid water enriched with a suitable fertiliser.

PEACHES AND NECTARINES.—In cases where trees were started sufficiently early they will be closely approaching their flowering stage, and once this takes place the syringing of them overhead must be discontinued. Immediately before the buds expand thoroughly vaporise or fumigate the house, and during the blossoming period maintain a dry and circulating atmosphere by keeping the ventilators slightly opened. Keep the night temperature at 45 degrees, with a slight rise from fire heat by day, and in sunny weather carefully regulate the temperature, and the circulation of the air by means of the ventilators. Assist the flowers to set by daily adopting the usual means: in dull and wet weather this is especially needful. The winter work to be done in late houses should be completed without delay. Leave the ventilators fully opened until the blossom buds commence to open. The practice of keeping in peach houses during winter plants of any kind that need fire heat protection should not be followed if it can possibly be avoided.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

ROOT STORES.—All clamps and stores of roots should be examined, whether inside or out, removing all premature growths, and any that show the least signs of decay. Onions, whether in trays or suspended, require sorting likewise, as decay in these rapidly spreads to the sound bulbs. Keep these very cool.

LEEKS that are in trenches will need protection should severe weather set in. This may be given by placing long strawy litter or bracken fern around them.

CELERY must be given the same treatment, but whenever there is any open weather uncover, if only for a few hours, to keep the plants as hardy as possible.

SEAKALE.—The whole of the plot devoted to roots for forcing indoors can, with advantage, be dug up now that they have shed all their leaves. It will be labour well spent during the very wet weather we are experiencing, as the rootlets can be made into cuttings during wet times, and plunged in boxes in bundles. The crowns should be laid in sand or finely sifted ashes behind a north wall, and a few placed in the forcing quarters, which will not take up much valuable time when outside conditions for other work are favourable.

RHUBARB CROWNS can be taken up in required numbers for future planting in the forcing house, also to save time later. They will only require a light covering of leaf-soil while laying in a dormant state, preferably behind the north wall.

SPINACH.—The winter breadths of this will need every care to maintain a good supply, particularly on heavy soils and in exposed positions. Frequently stir the soil whenever possible, with an occasional dusting of soot, alternated with one of lime. Shelter is most beneficial to this crop to maintain an active growth of leaves. Here we place hedge-like rows of conifer boughs on the windy sides of the plots. Make a sowing on a very gentle hotbed, where material permits, in frames.

CABBAGE.—The July sowings are remarkably good, even showing their little white hearts already, and will form a splendid succession to the much-esteemed colewort. They will require shelter, as advised for spinach, although on sheltered borders. Cold frames containing various kinds of vegetables will require regular attention as regards ventilation, protection, clearing decaying leaves away, and stirring of the soil, whether planted out or in boxes. Sow lettuce in boxes, also cauliflowers, as Early Forcing, First Crop, and Magnum Bonum: place in a temperature of 45 degrees, near the glass.—George Ellwood, Swanmore Park Gardens.

JAPANESE CHRYSANTHEMUMS FOR EXHIBITION.

(Concluded from page 1012.)

BUD SELECTION.

I have, in another place, attempted to show the necessity for the selection of those buds that give us the best type of flower consistent with size. This bud selection, with its accompaniment of stopping, is one more for the expert than the novice, and I cannot help giving it as my opinion that the elaboration of a system of stopping, so intricate in all its bearings as we find it put before the novice in chrysanthemum growing, is not always a source of help, but only too often proves a beginner's undoing. If the advice given were simply a matter of stopping when the plants attain a certain stage the system would be better understood, but even then we must always have these facts before us, i.e., that we lay down a system applicable to the expert whose plants are of a highly cultivated nature, and at the same time offer it to the novice, whose plants may be altogether of a different character. We see in our gardening papers numberless questions as to taking the buds of different varieties, and the answers invariably given are the hard and fast unqualified advice of some handbook. How can the same treatment apply to the expert's advanced plants and to the novice's, which are probably only in their infancy? Even to the expert dates for stopping must be largely a matter of district and seasons. A much better guide to place before the amateur is the old system of stopping between the shifts. If you advise stopping, say, for second crown, the plants should be so far advanced as to be establishing themselves in their 3½in. or 4in. pots. If for first crown, in which we only just want to anticipate the bud of some rather late variety, then the time to stop is in the next shift—the 5in. or 6in. pot. This would be more understandable, but even then the strong plant of the expert and the weaker one of the novice cannot be expected to give the same result. Far better for the novice if he relied upon crown buds throughout, without any stopping. He would certainly have stronger plants, and a far larger number of blooms at a given date than he would from any system he does not thoroughly understand. Nor is this all. Under the best of cultivation, stopping in the early stages of growth must be detrimental to the plant's well being. It is a check just at the time we want vigorous growth, and should only be practised when we cannot obtain the same results in some other way, principally by earlier or later striking of the cuttings. Stopping the plants, too, must, under the best of conditions, be largely a matter of speculation; we may or may not obtain the results we seek for; when we do not we blame the season.

Under the old system before this elaboration of stopping was invented, we relied upon our buds more largely from natural growth. If crown buds formed before a certain date, say, the end of July, we sent the growth on to the next bud. After that time we took all buds that came in, and the result worked out just as evenly as by the new system; and I maintain that it is only the expert who can expect to obtain any material advantage from the process of stopping. I do not by any means altogether condemn the system, but I do condemn the hard and fast lines upon which it is laid down. That nurserymen in their catalogues should give their opinion as to which and the best results may be looked for is right enough; it gives some idea for the grower to work upon; but the novice should ask himself whether such advice is applicable to his case. How often does an amateur stop his plants to obtain a second crown and when they are not even strong enough to obtain good blooms on the first, the result being that he often gets nothing. All this may be a matter of controversy, but I am chosen here to give my opinions, and you must take them as such. I shall welcome any criticism.

DAMPING.

This is an evil that few growers escape from, losing some of their earlier blooms through scalding. We have it more or less every season, and we cannot shut our eyes to the fact that it is mainly caused through immature wood and overpotting. In our endeavour to grow the plants as luxuriantly as possible we sometimes overstep the mark. I think in most instances over-potting is the great fault. As I have already explained, if the root action is not completed in time, which it cannot be when overpotted, the plant cannot properly mature. Some growers call the evil "sun scorching," which is hardly correct. Certainly the rise and fall of temperature on variable sunny days is the time they damp most, although they will do so just the same on dull, warm, close days when it is difficult to move the air.

The sun does not directly scorch any flower. What really happens is, that the house goes up suddenly to a high temperature, and all those plants having an amount of unripened growth get overcharged with sap, which is forced up to the bloom; then with the sudden lowering of temperature when the sun goes in, this sap has no escape, and as it is chemically heated from feeding, the blooms scald from inwardly, the sap bursting through the florets. If you go and examine the blooms after dark you will see spots of moisture glistening on the petals. It is only the big, heavy blooms that damp, where the plants are restricted to the orthodox number of flowers. Why do not the smaller flowers on bush plants scald, or the more delicate florets of singles?

If you shade by putting paper over the blooms they damp just the same; in fact, I sometimes think, worse. Why does not the sun scorch them later on in the season, it is often as powerful towards the end of October as in the beginning; simply because by that time the roots are more at rest and the growth more ripened—ripened by that same sun that was the undoing of the earlier blooms. Growers should be more careful in matter of potting, etc., and not blame the sun and the season for all their failures. What is more to the point is, how to stay or even modify this evil. I think the first thing that crosses our mind is to shade and keep the house cool when we have these sudden glimpses of sun, although excepting for this damping or scalding we can generally do with all the sun we can get at this particular season. But the continual putting on of shading and taking it off again is not always possible.

The next thing I suggest is to prevent the sudden drop of temperature on these occasions, by having the pipes in the house heated at least an hour before the sun goes in, and also when it does go in, partially lower the ventilators for a time. Thus the more gradual drop of the temperature will save many blooms that might be swaying in the balance. I think at the early part of the season the houses should be kept cool at night. It is far better to have a little cool damp than to fire up and create steam. I only recommend firing for the special purpose mentioned. Where we have heavy dampness at night a good plan is to lay pieces of blotting paper over the blooms, which will absorb the moisture hanging about them.

COLOUR.

Nothing shows the skill of the grower more than the preservation of colour in large blooms. The ground colours of white and yellow are, of course, fixed colours, although even these can be rendered dull by a long period of bud development. It is the "surface tints" that are so fleeting. Those that we have infused by the process of cultivation. Say we have a variety like Algernon Davis. Its natural colour on the terminal bud is a rich chestnut. On an intermediate bud we reduce it to a bronzy tint; while on an early crown bud it is quite yellow. The difference is only one of slow bud development. Colour sap is stored in the foliage, and in the case of these crown buds taking so long to develop it has all evaporated before they open. Some people might express this more scientifically, this is my way as a gardener of expressing it. Now it becomes a question how far in the process of feeding or otherwise can we study those chemical properties which we find have a direct influence on colour. Although nothing we can give to our plants can be of any material assistance unless we have as a basis the health and vigour of the plants themselves, yet in dealing with colour in connection with general feeding, I find from long experience and trials with various compounds, that nothing enhances colour to a greater degree than those salts so freely found in the lower grades of common guano. This guano is the droppings from great sea birds which feed entirely upon fish, and their deposits contain these various salts, which, whatever may be their value as plant food, undoubtedly act as I have said directly upon the colour sap of the plant. Experiments with common salt, sulphate of potash, and sulphate of iron, all give decided evidence of their quick action on colour, and also does, as most of us know, that gardener's common friend, soot.

These things when given as auxiliaries to the general feeding are most useful while the buds are swelling, but as at this time even general feeding is only needed sparingly, care must be taken that one sort of food does not overlap others. Much of what we find as the results of cultivation must in the nature of things be more or less a speculation to us. We know the chemist can and does produce colour at will; but it certainly would not be for the happiness of the gardener could he do likewise. For could we so easily create colour to our will very much of the interest in horticulture would be lost.

HOUSING.

We now come to the last important point, the proper housing of our plants. Failure to observe Nature's requirements in this direction is often the undoing of all our previous work. Plants when placed under glass require just as much light and air as they did when out of doors. It is sometimes painful to see plants so huddled together that all the lower parts of the plants have neither light nor air; and it is impossible for them to perform their last functions properly. The leaves, for want of light, soon begin to droop and fade; mildew becomes rampant, and much of the plant's vitality is gone, and the result is that we see blooms when two-thirds developed unable to get further. It is far better to grow half the number of plants than ruin all by overcrowding.

THE PERFECTING OF THE BLOOMS.

Although a good finish to the centre is everything, yet the preservation of the lower florets is also most important. Blooms soon begin to lose weight when these are gone. Many Japanese blooms, especially the early ones, are overcrowded with petals, and it is much better to thin out florets from all over the bloom as they are developing than wait till the finish, and then have to pull out both short florets and those at the base too. Thinning not only lets air through more easily, thus keeping the bloom fresher, but allows those remaining to throw out and develop into longer and more substantial florets. You throw the shoulders of the bloom out, get better form, and, as I have said, retain to the last those lower florets that are often the true value of the bloom. It is not so much the number of florets as the length and substance of them that give quality and weight.

After all our care we find some blooms not strong enough to finish, and we have what we call an eye. To pull this out requires careful handling. Some growers wait till they want to use the flower, and then pull the whole of the seed vessels out at once, often ruining a bloom that might have finished up a good one. It can be seen when the flowers are half open that there will be seed vessels in the centre, and a commencement should at once be made to pull them out with the tweezers, starting a few at a time, not from the middle, but from the outside. In all cases, eye or no eye, all short florets that show no signs of developing should be got rid of at once. As soon as the flowers are nearly developed shade with tissue paper during bright sunshine to preserve their colour and freshness, and if the house shows signs of dampness cover with blotting paper at night, at least, those you mostly set store by. As soon as it is seen that any blooms are on the turn it is best to cut them and place them in long neck bottles half full of water, and keep in a dark room or shed. The foliage should be cut off unless they are required to be shown with the foliage. Do not, however, show stale blooms if it can be avoided.

Having now treated upon most of the important points that appeal to me in connection with the proper development of these Japanese blooms, I can only say I trust that I have made myself explicit. In this paper I have not attempted to deal with all the details of cultivation, but I hope that all growers, experts or otherwise, may have found some interesting points. I have also tried to put before the novice and amateur the necessity for giving full consideration to those elementary details, failing which it is hopeless to expect success.

Two Good Bog Plants.—The exceedingly pretty double button-like flowers of Ranunculus aconitifolius fl-pl. and R. acris plena are among the most welcome of our early summer flowers. They are old-world subjects, and still current are the common names of "Fair Maids of France" and "Bachelor's Buttons." Both plants attain their finest proportions in ground that is always moist, and both are first-rate plants for bog beds or positions adjacent to water. They attain a height of two feet under these conditions, the flowers of the first-named being pure white when fully expanded, in the last-named the flowers are bright yellow, and in both instances they are marvels of symmetry. It is only from established clumps that one secures the full effect of these fine hardy plants, and if several are planted together, so as to form a good-sized colony, they produce a rich floral display for several weeks, and at a season before any great number of bog plants are in flower. Both kinds succeed in positions fully exposed to sun; the flowering season may, however, be prolonged by planting in half-shady spots. —Thomas Smith.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Bournemouth Gardeners' Association.

On December 20 an excellent lecture on "The Management of Grass Lawns" was given by Mr. J. B. Stevenson, the able superintendent of the Bournemouth public parks and gardens. The president (J. H. Ralph Smythe, Esq., J.P.) took the chair, and, after the usual preliminary business had been gone through, called upon Mr. Stevenson to give his lecture.

Mr. Stevenson dealt in a very able manner with all the essential points connected with the making and keeping of lawns. He first pointed out the difference in the old method of cutting turves and that prevailing and generally followed at the present time. The proper way to level ground, especially where the latter was many feet lower on one side than on the other, was very fully explained. The lecturer laid stress upon the fact that all new soil used for filling-up purposes must be put on in thin layers, and be well broken up and made firm as the work proceeded. The tipping of soil in large bulk for such purposes was condemned, as it was not possible to obtain a firm, level surface by such means. He also advised the keeping of all good surface soil for replacing in that position, and the use of the subsoil for levelling-up purposes. Where levelling was not necessary Mr. Stevenson advised the thorough breaking up of the soil to a depth of about one foot, and the loosening of the subsoil, the latter being made firm again by treading, and also the top portion before turves were laid. Deeper trenching of soil was not necessary or advisable.

Well-rotted manure was recommended where the soil was very poor, but where it was of fairly good quality, manure, said the lecturer, should not be put in before the turves were laid. Surface dressings of rotted manure and bonemeal, afterwards, were more beneficial. All turves should be weeded before they were laid down, as it was a much easier matter to extract the weeds then than afterwards.

Mr. Stevenson deprecated the practice of hard beating down of turves directly they were laid. It would be sufficient to drop the heavy planks on each row of turves at the time, and then to wait for some time before any rolling, beating, or surface dressing work was done, as the newly-laid turves always proved more satisfactory when this course was taken. All fine top-dressing material should be raked to and fro with the back of a wooden rake; in this way the cracks would be filled more evenly.

Mr. Stevenson said turves used for bowling greens, especially, should be cut square, and then placed in a wooden frame, so that they could be made perfectly level by scooping off some of the soil, and he recommended the use of sand under the turves so as to encourage a fine and even growth of grass.

The sowing of seeds to form lawns was also dealt with in much detail. The lecturer advised the members to always lay turves around the outside of the plot, or next to the paths, and, furthermore, to sink down all such turves to the general soil level. He did not advise anyone to mark out the plot into so many divisions for the purpose of seed sowing, but to scatter the seeds thickly, as the closer the grasses grew the finer they were. The seeds, he said, should be sown on a newly-raked surface, and then they must be raked in by using the latter tool in opposite directions. The lecturer advised gardeners to make free use of bonemeal as a manure for lawns. If organic manures were used they should be well broken up, and also all lumps of lime when the latter was applied, else the grass would be killed in patches. Weeding, mowing, rolling, and the killing of moss were subjects ably dealt with. A good discussion followed, and hearty votes of thanks to the lecturer and chairman brought to a close a very pleasant evening.

Lyndhurst and District Gardeners' Association.

Mr. A. Witt, gardener to the president (R. G. Hargreaves, Esq., Cuffrell's Park), gave a lecture on "The Propagation of Hardy Fruit Trees" on December 16th, before the members of this newly-formed association. The lecturer is a well known and highly respected gardener in the New Forest district, and a very able cultivator of hardy fruits.

He first dealt with the different kinds of stocks, recommending the paradise stock for apples for small gardens, stating as his reason that the trees growing on this stock kept a very dwarf habit, and produced the best coloured fruit. The most suitable stocks for pears and plums were also dealt with by Mr. Witt, who recommended the quince stock for cordon pears, and advised that the latter be grown in the open spaces on walls between the large trained specimens, where they would prove satisfactory in every way, and bear the finest fruits. Grafting and budding were dealt with in a very able manner, as also were the principal details in connection with the pruning and training of the young trees until the stage when it was advisable to allow them to bear fruit. At the close of the lecture a very animated discussion took place among the members, who thoroughly appreciated the lecturer's remarks.

Some very fine exhibits were staged, namely, a nice collection of apples from Mrs. Penton, of Bench House; beautiful fruits of Hillier's Easter Orange, and Aromatic Russet apples from Mr. Witt; and free-flowered plants in pots of violets from Mr. Peckham, gardener to Mrs. Chawner, of Forest Bank House.

Hearty votes of thanks to the lecturer and the chairman, Mr. H. Golden, brought a pleasant evening to a close.

St. Ives, Hunts.

This annual show was held, as in former years, in a large marquee in the Broadway, St. Ives, on Monday, the 19th inst., and was largely visited. The entries were very numerous, and in addition to the classes for roots and other kinds of farm produce, classes were provided for hardy fruit, vegetables, etc. The contributions to the classes for garden produce, with a goodly supply of plants and flowers for decorative purposes, supplied by Mr. B. Giddings, florist, St. Ives, produced a large and attractive display. As the show was held on market day, the tent was inconveniently crowded. The show is conducted on excellent lines by an enthusiastic committee, and the president, C. H. Coote, Esq., J.P., and hon. treasurer, R. M. Copley, Esq., both take an active interest in the society's welfare. Mr. G. H. Cannon, the acting treasurer, fills his office in a thoroughly capable manner.

The prizes in the fruit classes were keenly contested, and for a single dish of culinary apples there were twelve entries. The best varieties were Lane's Prince Albert, Mère de Ménage, and Bramley's Seedling. J. Linton, Esq., Stirtloe, was a capital first, T. King, Esq., Colne, second, and M. N. Day, Esq., Findarton, third. For a dish of Cox's Orange Pippin there were eleven entries, and all the fruits were of high quality; G. Hunnybun, Esq., Godmansburton, was first in a keen competition; R. M. Copley, Esq., St. Ives, second; and G. D. Day, Esq., St. Ives, third. For dessert apples other than Cox's Orange Pippin, C. Cousins, Esq., was placed first with a fine dish of Allington Pippin, followed remarkably close by R. M. Copley, Esq., with Ribston Pippin, E. Anderson, Esq., St. Ives third. In the class for three dishes of dessert apples, there were eight competitors, and the winning exhibit contained Ribston Pippin, Cox's Orange Pippin, and Blenheim Pippin, in superb condition. This was shown by J. F. Hooley, Esq.; G. Hunnybun, Esq., second; and W. J. Humphrey, Esq., third. In the class provided for a dish of twelve apples, dessert and cooking mixed, two fruits of each, in six varieties, the first prize fell to C. Cousins, Esq.; R. M. Copley, Esq., was second; and J. Linton, Esq., third.

For three dishes of dessert pears, the successful competitors were T. Longman, Esq., J. F. Hooley, Esq., and R. M. Copley, Esq., in the order of their names. The first prize in the class for a single dish of dessert pears was won by T. Longland, Esq., with superb samples of Doyenne du Comice; W. H. Humphrey, Esq., second; and C. H. Coote, Esq., third.

Potatoes were shown remarkably well, both in the classes for kidney and round varieties. In the former, C. H. Coote, Esq., was first; C. E. Girling, Esq., Hemingford, second; and G. D. Day, Esq., third. For twelve round potatoes the prize-takers were C. Cousins, Esq., E. E. Chambers, Esq., St. Ives, and G. D. Day, Esq. Onions also were largely shown, and the bulbs were of good size and well finished. The first prize was awarded to C. Cousins, Esq., Croxton Park; and J. F. Hooley, Esq., and F. Golding, Esq., were second and third.

Bristol Gardeners' Association.

The usual fortnightly meeting was held at St. John's Parish Rooms, Mr. E. T. Parker in the chair. A paper on "The Herbaceous Border" was given by Mr. Thomas, of Llanishen, Cardiff. Mr. Thomas said that hardy perennials are everywhere taking the lead, and to attain success he said it was necessary to secure plants from a good stock. He did not believe in massing a large number of plants of one variety, because of the big gaps made when cut down, but rather of grouping different plants of the same colour, and there should be no limit of varieties grown. On dry soils planting could be done in the autumn, but on wet heavy soil this operation is best deferred till the spring. After giving details as to the care of borders when established the lecturer gave a long list of plants to grow, and the best method of grouping colours.

For two cypripediums Mr. E. T. Parker was first, Mr. Jennings second, and Mr. Shelton third. Upon being congratulated, the chairman said this was the first occasion he had won a prize for flowers, although he had won many for four-footed animals. Mr. Scott was awarded four points for apples King's Acre Bountiful and Lord Hindlip, and Mr. Woodward three points for Zygopetalum crinitum.

Aberdeen Natural History Society.

In presence of a crowded attendance of the members of this society, in the Botany Class-room, Aberdeen University, Mr. Mackie, the president, in the chair, Dr. James W. H. Trail, Professor of Botany in the University, delivered a highly instructive and entertaining lecture on "The Senses of Plants." The Professor, in his introductory remarks, said that, although they could not show that plants had distinct organs of sense, they undoubtedly had the power of perceiving certain influences from without, and they showed what was looked upon as a true possession of sense in animals—the power of response. Although plants could perceive certain influences, however, they had not the highly organised nervous system that was found in animals. The general opinion was that plants were absolutely inert and motionless, but among the plants that botanists had to study there were many that moved freely enough from place to place. These were usually very minute plants, and required water to move in, generally swimming about by means of hairs. He instanced the volvox, which for long was regarded as belonging to the animal kingdom. Dr. Trail then proceeded to deal

The Gardeners' Magazine

FOR THE NEW YEAR

Goes to Press on TUESDAY, Jan. 3, for publication on Jan. 7th.

OUR ALMANACK for the Year—A NEW HYBRID ROSE—printed in colours accompanies this issue, and there will be many Articles and Fine Illustrations of especial interest.

A BOLD ADVERTISEMENT

In this Number is a necessity to Firms whose trade lies among Horticulturists of the Higher Class.

Order it at Once, and send Copy not later than Tuesday next.

148 and 149, Aldersgate Street, London, E.C.

with the important part played by protoplasm in plant life, and went on to relate in a most attractive manner, with the aid of capital lantern slides, how the Drosera, or Sundew, caught flies for nourishment. Although one could scarcely say that plants possessed all the organs of touch, taste, smell, sight, and hearing, they certainly responded to touch, and what corresponded to sight in the way they turned to the light. Indeed, the senses of plants were not so very rudimentary as one might suppose. The action of the mimulus and other plants in regard to fertilisation was touched upon, and the inducements held out by certain plants to attract the visitation of insects proved one of the most delightful parts of the lecture. The red spots on certain plants were regarded as rudimentary eyes, though not having the power of vision. In regard to the sense of taste, an instance occurred in what was known as "finger-and-toe" in the turnip, the sense of taste being indicated by the movement of what the farmer so much disliked towards the root of the turnip. Dr. Trail then pointed out how long hairs acted as levers, and to improve the sensibility of plants. He also dealt with the action of the Venus fly-trap and Mimosa pudica as sensitive plants, and showed numerous excellent illustrations on the screen.

Concluding, the Professor remarked that he thought it would be well established that plants had sense, although not a nervous system. It might be claimed that plants showed sense corresponding to taste and touch, and to sight of a very rudimentary character.

Most appreciative remarks regarding the lecture were made by the Chairman, Mr. William Dawson, lecturer in forestry in the Aberdeen University, and Mr. Arthur Clyne, architect, at the close of which Dr. Trail was warmly thanked for his lecture.

TRADE NOTE.

We are informed by Mr. Herbert Stanley that his connection with the firm of Messrs. Stanley and Co., Southgate, ceased on the 20th inst., and that he will continue to devote his attention to orchids.

OBITUARY.

◆

MR. T. B. FIELD.

With very deep regret we record the death, at Ashwellthorpe, Norwich, of Mr. T. B. Field, who was a valued contributor to this journal, an able gardener, and one of the most estimable of men. Mr. Field, who was in his 68th year, underwent an operation about eighteen months since from which he was so slow in his recovery as to necessitate his giving up literary work for a longer period than was expected, but we had reason to hope that he would have been able to resume his contributions during the coming year. Mr. Field, who had been gardener to Sir Henry Tyrwhitt, Bart., and his widow, the Baroness Berners, at Stanley Hall, Bridgenorth, and Ashwellthorpe, Norwich, for the long period of forty years, was highly appreciated by his employers and held in high estimation by the gardeners in the districts of which Bridgenorth and Norwich are the centres. While at Stanley Hall Mr. Field was elected on the first committee of the Shrewsbury Flower Show, and when at Ashwellthorpe he took a prominent part in the horticultural activities of Norwich. For some years he was vice-president of the East Anglian Horticultural Club, and a year since he was elected president, and he completed his year of office a short time previous to his death. Mr. Field leaves a widow and family, who have our deepest sympathy in their bereavement.

THE LATE MR. T. B. FIELD.

JUDGE PHILBRICK, K.C.

We regret to record the death of his Honour Judge F. A. Philbrick, K.C., which occurred at Bournemouth on the 25th inst., in his seventy-fifth year. Judge Philbrick long held a high position in his profession, as evidenced by his having been appointed Recorder of Colchester in 1870, and on several occasions acting as special Commissioner of Assize. He was greatly interested in orchids and a successful cultivator, and a quarter of a century or so ago, when he resided in the Regent's Park district, his orchid houses contained one of the leading collections in London.

ANSWERS TO CORRESPONDENTS.

AMATEUR ROSARIANS.—Joseph Baretay, Gourock: Under the rules of the National Rose Society an amateur rosarian is a member who does not sell rose plants, rose blooms, or rose buds for budding, systematically or otherwise. An amateur who is fortunate in raising a new and meritorious rose may sell the stock to a nurseryman, but he must not retail it. There is no restriction as to the number of men and boys employed in the amateur's garden, and the garden may be under the charge of a skilled gardener. When, however, the amateur employs a gardener, with or without men under him, the roses are invariably shown in the name of the owner of the garden, and not in the name of the gardener. The society divides, for the purpose of the exhibition, the amateurs into classes, according to the number of exhibition roses they grow.

CLUB ROOT.—Northern Grower: Your crops of cabbages and kales were seriously injured by the slime fungus, causing the disease commonly known as club root. We would strongly advise you to burn all the stems on the ground when the ground is prepared for subsequent crops. This is an effectual check on the spread of the disease, and should be more generally resorted to. One of the most general causes of the spread of plant diseases is the neglect to destroy by burning infected portions of trees or plants. Club root is one of the diseases with which horticulturists are familiar, and there can be no doubt that the losses resulting from its ravages amount to many thousands of pounds annually. This disease is caused by a slime fungus, and when it has completed its life cycle it breaks up into myriads of spores, by which reproduction is effected under conditions favourable to their development. If cabbage, broccoli, or borecole stems infected with club root are taken to the rubbish heap, the fungus will in due course break up into spores, and these will be distributed with the decayed vegetable matter and infect the quarters to which it is applied. Therefore, when the diseased stems are taken to the rubbish heap there is a risk of spreading the disease over the whole garden. The proper course is to burn the stems, but frequently the quarter is trenched, and the stems buried in the bottom of the trench. A good dressing of gas lime would be useful in checking the development of the fungus.

CAMELLIAS IN UNHEATED HOUSE.—W. B., Southampton: We know of no class of plants that are better suited for furnishing your conservatory than camellias. Your conservatory is unheated, and occupies a shady position, and camellias are quite hardy, and thrive in the shade. You require plants that will not impose any considerable tax upon your time, and it may certainly be said of camellias that they require comparatively little attention to maintain them in a healthy condition. They can be successfully grown in pots or planted out, but as you have but little time to devote to them we suggest planting out as the preferable method. If you decide upon planting them in a bed of soil made up within the house, commence by excavating the soil to a depth of about three feet. Then cover the bottom of the excavation with a twelve-inch layer of broken bricks, and over this place a layer of turf about two inches in thickness, grass side downwards. The layer of broken bricks is intended to ensure the free passage of the water through the soil, and then to carry it away. Connect the drainage materials with an outside drain. The layer of turf is used for the purpose of preventing the finer portions of the soil running down among the broken bricks, and thus impeding the escape of the water. A bed of soil should then be made up to a depth of two feet, and good turfy loam broken up rather roughly should be employed. Sometimes manurial matter is used, but it is better to form the bed with loam only and assist the plants

with weak liquid manure or top dressings of artificial fertilisers after they have become established. If you have room for only one row of plants, make the bed three feet or three feet six inches wide. The following will form a good selection: Auguste Delfosse, Augustina superba, C. H. Hovey, C. M. Hovey, Countess of Orkney, Chandleri elegans, Donckelaari, Fimbriata, Lavinia Maggi, Matthotiana, and Reine des Fleurs.

CHRYSANTHEMUMS.—Young Gardener: It would have been well had you been more explicit, as we could then have given you more definite advice. Speaking generally, we would say that, with the exception of the late-blooming varieties grown especially for the production of flowers at midwinter, chrysanthemums will now be past their best, and must be removed from the conservatory to make way for other plants. Chrysanthemums from which it is desired to obtain cuttings should, on their removal from the conservatory, be cut down to within six or seven inches of the surface, and placed in a pit, where they can be kept safe from frost, as a few degrees will suffice to seriously damage the tender growths. The propagation of chrysanthemums intended for the production of exhibition blooms and specimen plants should be proceeded with as the supplies of cuttings become available. All chrysanthemum plants not required for furnishing cuttings should be consigned to the rubbish heap, and the soil be formed into a heap for use in potting off bedding and other plants not requiring maiden loam.

NATIONAL DAHLIA SOCIETY.—C. H., Kent: The hon. secretary of the National Dahlia Society is Mr. E. F. Hawes, Royal Botanic Gardens, Regent's Park, London, N.W.

TUBEROUS BEGONIAS.—F. S., Leicester: There is really no great difficulty in raising a stock of plants from seed that will give a good display of flowers in flower beds and borders in the course of the following summer, provided the details essential to success are understood, and the necessary conveniences are at command. In your case the preferable course will be to purchase tubers, and if you obtain them in assorted colours you will have no difficulty in planting the beds in such manner as to produce a satisfactory effect. The seedlings would require, for at least three months, much warmer conditions than with the structures available you would be able to give them.

DISEASED RHODODENDRON.—T. J. G., Surrey: Your specimens of Rhododendron hirsutum are suffering from the fungoid disease caused by the species known as Exobasidium rhododendri. The gall-like swellings on the leaves, which in the specimen you have submitted are highly developed are a sure indication of the presence of the disease. The first indication of infection is the appearance of a small brown spot on the surface of the leaf, where the spores of the fungus have penetrated the epidermis and begun to form a mycelium within the cells of the epidermal tissues. The presence of the mycelium causes a rapid and abnormal growth of the tissues of the host and gall-like swellings are soon to be seen on every leaf, and varying in size from a pin's-head to a good sized marble. You may probably remember that the surface of the galls on the leaves of your plants were, during the summer months, covered with a delicate, almost peach-like bloom, which is due to the presence of the countless minute spore bearing basidia. This fungus is rather difficult to combat, but much might be done to check it by gathering all diseased leaves before the bloom, due to the presence of the spore-bearing organs of the fungus, makes its appearance on the galls.

AMERICAN GOOSEBERRY MILDEW.—Market Grower: So far as we can gather from the particulars you supply, you cannot sell the gooseberry bushes without first having obtained a licence from the Board of Agriculture. You will certainly incur the risk of a rather heavy fine by doing so. Three licences are issued by the Board, and the one adapted to the circumstances of your case is that known as Form C. With reference to this licence the Board of Agriculture state in their recently-issued memorandum that "a licence (Form C) will be issued on the application of any scheduled grower who wishes to move his bushes, or cuttings from them, from scheduled premises to another part of his own premises, and who can satisfy the Board that the bushes have been duly pruned. Such licences are also issued to fruit growers who wish to sell a few bushes, but not to trade in bushes extensively. The conditions of this licence require that the bushes shall be moved from premises specified in the licence to other premises also specified in the licence and before a specified date. Applications for such a licence must be made on a special form, which will be sent on application to the Secretary of the Board of Agriculture and Fisheries." The address is 1, Whitehall Place, London, S.W. You must refer to the garden for which you require the licence, and the name or description as written on Form A declaring the premises infected must be quoted.

PROPAGATION OF DAHLIAS.—W. R. H., Rutland: It is too early to commence the propagation of dahlias, and at the proper time we shall deal with the subject more fully than is now possible. One of your questions we will answer at once, and it is the one relating to the influence of method of propagation on period of flowering. The earliest plants to flower are those raised by division of the roots. The roots are started into growth with the aid of a moderate temperature, and divided when the new growths are about three inches in length, putting them in pots just large enough to receive the roots. Each portion should have one growth attached. When it is intended to increase the stock by division the tubers should be shortened to about one-half their length a few weeks previous to their being started into growth.

City Diary.—Once more the "City Diary" has made its appearance on our table, and as it has been a constant companion for about thirty years, it has been heartily welcomed. The "City Diary" is indispensable as a work of reference to the City man, constituting as it does a thoroughly trustworthy guide to the City of London in its many ramifications. It contains a complete list of the members of the Corporation, the names and addresses of the clerks of the Guilds, particulars of the City churches, and the personnel of the various municipal and parochial organisations. The "City Diary" is of a convenient size for constant use, the paper is excellent, and the pages are interleaved with blotting paper. It is published at the "City Press" offices, 148 and 149, Aldersgate Street, London, E.C., price 1s., by post 1s. 3d.

CATALOGUES RECEIVED.

MESSRS. E. WEBB AND SONS, WORDSLEY STOURBRIDGE.—The seed catalogue we have received from Wordsley is substantial and comprehensive, and will be found especially attractive to those who have a predilection for novelties, for associated with the fine types that have been introduced by the firm are a considerable number of new types of great promise. The illustrations are plentifully interspersed with the text, and include several of special interest, as evidence of the great taste displayed by the firm in presenting their products to public notice at the leading public exhibitions.

MESSRS. DICKSON AND ROBINSON, CATHEDRAL STREET, MANCHESTER.—The catalogue of seeds for 1911, issued by this firm is admirably prepared, profusely illustrated, and so comprehensive in scope as to include all the subjects usually raised from seeds that are required in the well-equipped garden.

MESSRS. DICKSONS' ROYAL SEED WAREHOUSE, CHESTER.—The illustrated catalogue of garden seeds, etc., issued by Messrs. Dicksons' is substantial in character, and in its well-filled pages are found well-prepared lists of useful crops, and the ornamental plants that are raised from seeds and considered essential to the production of beautiful effects in the conservatory, plant stove, and flower garden. The catalogue also contains a full list of horticultural sundries.

MESSRS. W. CUTBUSH AND SON, HIGHGATE, LONDON.—The catalogue of seeds received from Messrs. Cutbush and Son is of interest from the fact that it is the ninetieth annual of its kind issued by the firm; but we need hardly say that its chief interest is to be found in the admirably prepared lists of vegetable and flower seeds that have a place between its covers. Need it be said that Cutbush's Miltrack Mushroom spawn has a prominent attention directed to it.

MESSRS. DICKSON, BROWN, AND TAIT, 43 and 45, CORPORATION STREET, MANCHESTER.—A full and otherwise excellent publication is the seed catalogue which this firm has sent us.

WILLIAM BULL AND SONS, KING'S ROAD, CHELSEA.—A neat and admirably prepared catalogue which has an added interest from the fact that it marks the jubilee of this well-known firm.
